become a centre of darkness and slavery.
The task is to destroy this centre, to the joy
and relief of the workers.*

STALIN, *Zhizn Narsional' nosti*,
No. 6 (1918)

To the Reader

Who started the Second World War? There is no single answer to this question. The Soviet government, for example, has repeatedly changed its official line on the issue.

On 18 September 1939, they stated in an official note that the government of Poland was the instigator of the war. On 30 November 1939, however, Stalin named other culprits in the newspaper, *Pravda*: 'France and Britain . . . attacked Germany, thereby taking upon themselves the responsibility for the present war,' he wrote. By 5 May 1941, the story had changed again : in a secret speech to graduates of military academies, Stalin laid the responsibility on Germany.

After the war had ended, this circle of 'culprits' grew. Stalin announced that the most blood-stained war in the history of humanity had been started by all the capitalist countries in the world – in other words, all the sovereign states in the world including Sweden and Switzerland, but excluding the Soviet Union.

Stalin's view has long been established in communist mythology. During the times of Khrushchev and Brezhnev, and as recently as Andropov and Chernenko, these accusations against the rest of the world were frequently repeated. Under Gorbachev, much is changing in the Soviet Union, but Stalin's view about who started the war remains unchallenged. Lieutenant-General P. A. Zhilin, chief historian of the Soviet Army, repeated during the Gorbachev era that 'the perpetrators of the war were not only the imperialists of Germany, but of the whole world'. (*Red Star*, 24 September 1985)

I would like to suggest that, from the beginning of the war, the Soviet communists made accusations against every country in the world with the deliberate intention of concealing their own role as its instigators.

After the First World War, the Treaty of Versailles deprived Germany of the right to a strong army and offensive weapons, including tanks, military aircraft, heavy artillery and submarines. German commanders were unable to use German territory to train for the waging of offensive wars. So they began to make their preparations in the Soviet Union. Everything possible was done, on Stalin's orders, to enable German commanders to carry out military training on Soviet territory. They were given training classes, artillery and shooting ranges, as well as tanks, heavy artillery and military aircraft which, under the terms of the Treaty,

they had no right to receive. Similarly, German commanders were given access to Soviet tank-manufacturing plants, the most powerful in the world. *Look, remember and copy.* From the 1920s on, sparing neither resources nor effort, nor indeed time, Stalin revived the strike power of German militarism. Certainly not against himself. For what purpose? There is only one answer – so that war would be declared on the rest of Europe.

Stalin understood that a powerful, aggressive army does not start a war by itself. A mad, fanatical leader is also needed. Stalin did a great deal to see that just such a leader should appear at the head of the German nation. Once the fascists had come to power, Stalin persistently and doggedly pushed towards war. The high point of these efforts was the Molotov–Ribbentrop pact. In this pact, Stalin guaranteed Hitler freedom of action in Europe and, in effect, opened the floodgates of the Second World War.

Even before the Nazis came to power, the Soviet leaders had given Hitler the unofficial name of 'Icebreaker for the Revolution'. The name is both apt and fitting. The communists understood that Europe would be vulnerable only in the event of war and that the Icebreaker for the Revolution could make it vulnerable. Unaware of this, Adolf Hitler cleared the way for world communism by his actions. With his *Blitzkrieg* wars, Hitler crushed the Western democracies, scattering and dispersing his forces from Norway to Libya. This suited Stalin admirably. The Icebreaker committed the greatest crimes against the world and humanity, and, in doing so, placed in

Stalin's hands the moral right to declare himself the liberator of Europe at any time he chose – while changing the concentration camps from brown to red.

Stalin understood better than Hitler that a war is won by the side which enters it last and not by the one which goes into it first. Stalin granted Hitler the doubtful honour of being the first, while he himself prepared for his unavoidable entry into the war after 'all the capitalists (will) have fought amongst themselves'. (*Stalin*, Vol. 6, p. 158)

Much has been done to uncover the crimes of Nazism and find the butchers who perpetrated atrocities in its name. This work must be continued and stepped up. But while unmasking fascists, one must also expose the Soviet communists who encouraged the Nazis to commit their crimes, so that they could avail themselves of the results of these crimes.

The communists weeded their archives thoroughly a long time ago, but what still remains preserved there is almost inaccessible to researchers. I was fortunate enough to work briefly in the archives of the Soviet Ministry of Defence, but quite intentionally I am making little use of secret archival material. Overt Soviet publications are my main source. Even these are quite sufficient to place Soviet communists in the dock with Nazis.

My chief witnesses are Marx, Engels, Lenin, Trotsky, Stalin, and all the Soviet wartime marshals and many leading generals. The Soviet communists admit that they used Hitler to unleash a war in Europe, and prepared a sudden blow at Hitler himself in order to seize a Europe which had been destroyed by him. The value of my sources lies in the fact that it is the criminals themselves who speak of their own crimes.

I know that on the communist side there are many apologists. I took the communists at their word, so let us allow them to defend themselves independently.

Viktor Suvorov

MAP I

As soon as Britain and France declared war on Germany, the Red Army began to destroy its own defensive systems. The Soviet Command was no longer interested in defending its own territory.

The 'death' zone is a security zone against a surprise attack from the West. Inside this zone, all transport, communications and water supply systems and industrial installations were made ready for demolition. Minefields and other engineered obstacles were set up to a depth of up to 150 kilometres. The zone was completely cleared of mines in the autumn of 1939.

Partisan detachments and bases had been set up in peacetime. They were dissolved in September 1939.

In the fortified regions of the 'Stalin Line', the work of demilitarization and destruction began in autumn 1939.

The combat operations zone of the Dnieper Naval Flotilla. The Flotilla was disbanded in June 1940.

MAP 2

The First Strategic Echelon of the Red Army.

The Soviet invasion armies of the First Strategic Echelon. Behind them, another seven Soviet armies were making their way to the frontier.

The deployment of the First Strategic Echelon rendered the defence of the Soviet Union almost impossible. Even a very low-powered strike by the enemy in this direction would have led immediately to the loss of five Soviet armies, including the 9th, which was the most powerful in the world, and the loss of vast material wealth, highly fertile lands, the undefended bases of the Black Sea fleet, and strategic air bases. It was precisely such a strike which the First German Tank Group delivered in June 1941 . . .

The 9th Army was concentrated not on the German border, but on the frontier with Rumania. A 9th Army strike at Rumania would be a strike at the undefended oil 'heart' of Germany.

The mountain invasion armies. This was the only possible direction in which they could have moved, along undefended ridges. They would have made it possible both to cut Germany's oil 'jugular' and to prevent the movement of German reserves into Rumania.

The 'first wave' airborne corps. Another five airborne corps were secretly being formed deep inside the Soviet Union.

MAP 3

How the Red Army was prepared to seize and destroy the Rumanian oil-fields.

The Ploesti oil-fields, Germany's chief source of oil.

The main pipelines for supplying oil to Germany and for loading it on to river- and sea-going tankers.

The Soviet Danube Naval Flotilla and the only possible way of using it in an offensive war. In a defensive war, the Flotilla would be unnecessary.

The Third Airborne Corps and the zone of its possible operational use. The Corps was set up in April 1941.

The 9th Army was secretly deployed on 14 June 1941, as TASS stated that the Soviet Union was not preparing for war.

The combat task of the 9th Army, according to the evidence of Air Marshal A. Pokryshkin.

The assault crossing of the Danube by divisions of the 9th Army's 14th Rifle Corps. Previously prepared and carried out in the first days of the war.

The 30th Mountain Rifle Division, part of the 9th Army, and the only place where it could be used for its intended purpose.

The 18th (Mountain) Army, secretly deployed on 13 June 1941, and the only possible direction which its operations could have taken. There are no other mountains in this region.

The 19th Army, the most powerful in the Second Strategic Echelon, was transferred from the Northern Caucasus. It contained mountain rifle divisions which could only have been used in Rumania.

The 9th Special Rifle Corps, in collaboration with the Black Sea Fleet, began intensive training in carrying out a naval assault landing operation on an enemy shore.

And overleaf

The Black Sea Fleet subjected the principal Rumanian oil port of Constanza to an artillery bombardment in the first days of the war.

The 4th Long Range Bomber Corps had Ploesti as its principal target in the event of war.

The 63rd Air Brigade of the Black Sea Fleet was specially trained to raid targets in the oil producing industry including, in the first days of the war, Constanza and the strategic pipelines which cross the Danube.

CHAPTER I

The Road to Happiness

*We are the Party of the class which is on the
way to
the conquest of the world.*
FRUNZE (Report to the military
delegates sent to the XI
Congress of the RKP (b) (1922))

Marx and Engels foretold a world war and lengthy international conflicts which would last 'fifteen, twenty, fifty years'. The prospect did not frighten them. The authors of *The Communist Manifesto* did not call on the proletariat to prevent war; on the contrary, they saw it as desirable. War was mother to the revolution. The result of a world war, in Engels' words, would be 'general exhaustion and the creation of conditions for the final victory of the working class'. (Karl Marx, Friedrich Engels, *Works*, Ch. 21, p. 351)

Marx and Engels did not live to see the world war, but a successor in their cause was found for them in Lenin. From the earliest days of the First World War, Lenin's party came out in favour of the government of their own country being defeated, so that the 'imperialist war might be changed into a civil war'.

Lenin calculated that left-wing parties in other countries would also come out against the governments of their own countries and the imperialist world war would be transmuted into a world civil war. This did not happen. Without abandoning hopes for a world revolution, as early as autumn 1914 Lenin adopted a minimum programme. If world revolution were not to result from world war, everything possible had to be done to make a revolution happen in at least one country; it did not matter which one. 'When the proletariat has conquered that country, it will stand against all the rest of the world,' fomenting disorders and uprisings

in other countries, 'or coming out against them directly with armed force.' (*About the Slogan of the ' United States of Europe'*)

For Lenin, as for Marx, world revolution remained the guiding star, and he did not lose sight of this goal. But according to the minimum programme, the First World War would only facilitate a revolution in one country. How, then, would the world revolution take place thereafter? Lenin gave a clear-cut answer to this question in 1916: as a result of the second imperialist war. (*The Military Programme for the Proletarian Revolution*})

Perhaps I am mistaken, but having read much of what Hitler wrote, I have certainly found no indications that in 1916 Adolf Schickelgruber was dreaming of the Second World War. But Lenin was. What is more, he was laying down the need for such a war as the theoretical base for the building of socialism throughout the world.

Events developed apace. The revolution in Russia occurred the following year. Lenin hastened there from exile. In the maelstrom of confusion and a total absence of authority, he and his party, small but militarily organized, seized power in a *coup d'etat*. In March 1918, he concluded the Brest-Litovsk peace agreement with Germany and its allies. At that time Germany's position was already hopeless. Lenin of course understood this. The peace he signed therefore freed his hands to strengthen, through civil conflict, the communist dictatorship inside Russia, and gave Germany considerable resources and reserves to continue the war in the West, which was exhausting both Germany and the Western allies.

By concluding a separate deal -with the enemy, Lenin betrayed Russia's allies. But Lenin also betrayed Russia itself. At the beginning of 1918, the victory of France, Britain, Russia, the United States and other countries over Germany and its allies was already inevitable. Russia had lost millions of soldiers and was fully entitled to be numbered among the victors, alongside her western allies. But Lenin did not need such a victory. He needed world revolution. Lenin recognized that the Brest-Litovsk peace had been concluded not in the interests of Russia, but in the interests of world revolution, in the interests of establishing communism in Russia and other countries. Lenin admitted that he had placed worldwide dictatorship of the proletariat and world revolution 'above all national sacrifices'. (Central Committee report on the VIII Congress of the RKP (b) (1919)) He even gave away to Germany, without a fight, a million square kilometres of the most fertile lands and the richest industrial regions of Russia's western territories, and paid out a war indemnity in gold. Why?

The reason is that the Brest-Litovsk 'peace' rendered millions of Russian soldiers unnecessary. No longer under the control of any authority, these millions went back to their homes, breaking the foundations of the state system and the newly born democracy on the way. Brest-Litovsk marked the beginning of the ferocious civil war; while brother fought brother, the communists strengthened and extended their power until, after a few years, the entire country was under their control.

Brest-Litovsk was directed not only against the national interests of Russia, but against Germany as well, and in both its sense and spirit it served as a prototype of the Molotov— Ribbentrop pact. Lenin's calculation in 1918 was exactly the same as Stalin's in 1939. Let Germany fight in the West, let Germany and the Western allies exhaust themselves one after the other to the greatest extent possible; we ourselves shall help Germany at any price to exhaust herself to the very limit, and then act.

While the peace agreement with Germany was being signed on Lenin's orders in Brest-Litovsk, intensive work was being undertaken in Petrograd to prepare the overthrow of the German Government. At that time, the communist German-language newspaper, *Die Fackel*, with a circulation of 500,000, was being published in Petrograd. SPARTAK, the German communist group, had been set up in Petrograd in January 1918, even before the Brest-Litovsk agreement was signed. Two other newspapers, *Die Weltrevolution* and *Die Rote Fahne*, also saw the light of day, not in Germany, but in communist Russia, again on the orders of Lenin who had signed the 'peace' with Germany. In the twenties, communism was striking deep roots in Germany. Indeed, Lenin set his hand to this precisely at the time when Germany was losing the war in the West and he had extracted a 'peace' agreement from her at her most vulnerable.

Lenin's calculation was exact. The German Empire would not be able to withstand the colossal pressure of a war of attrition; in fact it led to the downfall of the empire - and revolution. Lenin immediately annulled the treaty. Communist states strikingly similar to Lenin's Bolshevik regime arose from the ruins of empires in war-torn Europe. 'We are on the threshold of world revolution!' Lenin exulted. He then threw away his minimum programme. He no longer spoke of the need for a Second World War, as he now believed that world revolution could be accomplished as a result of the First.

Lenin set up the Comintern to be, in the definition of its own name, the world communist party, and gave it the objective of setting up a world Soviet socialist republic.

But world revolution did not follow. Communist regimes in Bavaria, Bremen, Slovakia and Hungary proved to be weak and unviable. When it came to seizing and wielding power, left-wing parties in Western countries displayed fickleness and vacillation, and Lenin could only give them moral support. The entire might of the Bolsheviks was thrown on to the home fronts and into the battle against the peoples of Russia who did not want communism. It took Lenin until 1920 to strengthen his position sufficiently inside Russia. It was only then that Europe became the arena targeted for revolution.

The favourable moment in Germany had already passed. Even so, Germany in 1920 represented an eminently suitable field for waging class battles. She had been destroyed and humbled. All her ideals had been desecrated and humiliated. A ferocious economic crisis raged throughout the land. In March, she was shaken by a general strike in which, according to some sources, more than twelve million people took part. Germany was a powder keg and only one spark was needed to set it off.

The official march of the Red Army (Budennyi's March¹) includes the words 'Let's take Warsaw! Then Berlin!' Nikolai Bukharin, the Soviet communists' theoretician, proclaimed a more determined slogan in the newspaper, *Pravda*: 'Straight to the walls of Paris and London!'

In the path of the Red legions, however, lay Poland. There was no common frontier between the Soviet Union and Germany; in order to ignite revolution it was essential to destroy the barrier dividing them. This was free, independent Poland. Unfortunately for the communists, at the head of the Soviet troops was M. N. Tukhachevsky, a commander who did not understand the essence of strategy. Tukhachevsky's armies were defeated before reaching Warsaw and shamefully retreated. At a critical moment, Tukhachevsky found himself without any strategic reserve and this ensured that the outcome was a spectacular defeat.

Tukhachevsky's defeat did not happen by chance. Six months before the Soviet 'liberation campaign' set out for Warsaw and Berlin, Tukhachevsky had laid down, as a 'theoretical base', that strategic reserves were unnecessary in war. Strategy has simple but inexorable laws. Its main principle is concentration. At the decisive moment and in the decisive place, *overwhelming power* must be concentrated against the enemy's most vulnerable point. In order to concentrate power in this way, it is necessary to have it in reserve.

¹ *Originally, the song was dedicated to Simion Budennyi, legendary hero of the civil war and later Marshal of the Soviet Union.

Tukhachevsky, did not understand this, and paid the price. As a result, the revolution in Germany had to be put off until 1923.

The rout of Tukhachevsky's hordes in Poland had very unpleasant consequences for the Bolsheviks. Russia suddenly rose up in a desperate effort to throw off the communist dictatorship. The workers, of Petrograd, the cradle of the revolution, went on strike; they demanded bread, they demanded their promised liberty. The Bolsheviks put down their demonstrations, but a squadron of the Baltic Fleet came out on their side. The sailors from Kronstadt (the principal Soviet naval base, near Petrograd), the same ones who presented power to Lenin and Trotsky, demanded that the communists be thrown out of the Soviets, or councils. A wave of peasant demonstrations swept the country; and in the woods of Tambov, a group of peasants formed an anti-communist army which was powerful and well organized, but badly armed.

Tukhachevsky's brutality at Kronstadt became legendary. The monstrous shooting of peasants in Tambov Province is one of the most horrifying pages in history. The author of this page is Tukhachevsky. The twentieth century has known quite a few villains such as Yezhov, Himmler and Pol Pot. By the amount of blood he has spilt, Tukhachevsky has fully earned his place alongside them, for in his time Tukhachevsky was the forerunner of most of these scoundrels!

In 1921 Lenin introduced the New Economic Policy, or NEP. There was nothing new in this plan, which boiled down to little more than good old capitalism. It is accepted that Kronstadt and Tambov were important reasons impelling Lenin to introduce elements of free-marketeering and to loosen the ideological running knot on the neck of society. One must seek more deep for other reasons.

In 1921 Lenin understood that the First World War had not led to world revolution. According to Trotsky's advice, it was, necessary to go over to permanent revolution, dealing blow after blow at the weak links in free society and, at the same time, prepare for the Second World War, which would bring final 'liberation'. Before the actual introduction of the NEP in December 1920, Lenin claimed that 'such a new war is unavoidable . . .' (A speech to the Moscow Council on the first anniversary of the Comintern, 1920) 'We have ended one phase of wars and we must prepare ourselves for the next.' (A speech to the VIII Congress of the Soviets, 1920) For

this purpose NEP was introduced. Peace is a breathing space for war. So says Lenin, so said Stalin and so said *Pravda*. The communists had put their lands in order to strengthen and consolidate power, develop an exceptionally strong war industry, and to prepare the populace for future wars, battles and 'liberation campaigns'.

The introduction of elements of free-marketeering in no way signified that preparations for world revolution and the Second World War had been repudiated. By the following year the Union of Soviet Socialist Republics - the USSR - had been formed. The declaration that accompanied the formation of the USSR itemized four republics; it was intended to go on increasing this number until the whole world formed part of it.

The declaration accompanying the formation of the USSR was a *dear and direct declaration of war on the rest of the world*. This declaration is still in force. Nobody has revoked it. Between this declaration and that contained in *Mein Kampf*, there is a difference. Hitler wrote his book later and it represents the view of one individual. *Mein Kampf* literally means *my* struggle. The declaration behind the formation of the USSR is an official document on the principal objective of a vast state, which is to destroy and subjugate all other states in the world.

CHAPTER 2

The Main Enemy

If there is one place where a start can be made to arouse Europe to revolution, that place is Germany . . . and victory of the revolution in Germany will guarantee the victory of world revolution.

STALIN (*Sochineniya*, Vol. 6, p. 267)

In 1923, Germany was again on the brink of revolution. Lenin was no longer taking part either in governing the USSR or directing the Comintern. Stalin had seized almost all the reins of government, although the fact that he had done so had not yet been grasped by the country, the world, or even by his rivals.

This is how Stalin himself described his role in the preparations which were being made for revolution in Germany in 1923 : 'The German Commission of the Comintern, consisting of Zinoviev, Bukharin, Stalin, Trotsky, Radek and a number of German comrades, took a series of specific decisions that direct assistance be given to the German comrades to enable them to seize power.' (Speech to the Plenum of the Central Committee and Central Control Commission of the VKP (b), 1 August 1927)

Boris Bazhanov, Stalin's private secretary, gave a more detailed description of these preparations. The resources which were allotted to them were enormous. The Politburo decided at a secret meeting that nothing would be spared. All communists of German extraction living in the Soviet Union were prepared for action, as were all communists who spoke German. They were sent to Germany to do clandestine work. It was not just rank-and-file communists who were moved into Germany. Top-ranking Soviet leaders, including Vassily Schmidt, a Soviet People's Commissar, Joseph Unschlikht, deputy chairman of the GRU² and future head of military intelligence, and Karl Radek and G. L. Pyatakov, then members of the Central Committee of the Soviet Communist Party, were all sent to Germany as well. N. Krestinsky, the plenipotentiary representative, or ambassador in Germany, set to work with feverish intensity. The Soviet Embassy in its entirety became the nerve centre for organizing the revolution: instructions from Moscow, a flood of money which was immediately spent on mounds of communist literature, and an avalanche of arms and

² The Soviet Secret Police frequently changed its initials; this was another variation of the NKVD or the KGB.

ammunition all flowed through the Embassy. 'Unschlikht was given responsibility for recruiting, equipping and organizing the armed insurrectionist detachments which would carry out the *coup d'etat*. He was given the added responsibility of organizing a German secret-police force and of exterminating the bourgeoisie and the enemies of the revolution after the *coup* had taken place.' (B. Bazhanov, *Memoirs*, Paris 1980; p. 67)

The Soviet Politburo worked out the blueprint for the *coup* in detail and ratified it. The date on which it was to take place was fixed for 9 November 1923. But the revolution did not happen. The reasons for this were many.

First, the great bulk of the German populace chose the golden mean. They favoured the Social Democrats. The Communist Party did not have the support it needed among the masses. What is more, the Party was split into two factions, and as Lenin and Trotsky saw it, the Party leaders were not displaying sufficient determination. Secondly, Germany and the Soviet Union did not share a common frontier. As they had found four years previously, Poland lay between their two countries. Had there been a common frontier, then the Red Army would have been in a position to help the German Communist Party and its indecisive leaders.

The third and perhaps most important reason was that Lenin was dying, and for some time previously had ceased either to govern the Soviet Union or lead the world revolution. Lenin's heirs were many - Trotsky, Zinoviev, Kamenev, Rykov and Bukharin. Alongside these obvious rivals worked the modest Stalin, whom no one saw as an aspirant to power, but who, in Lenin's words, had already 'concentrated unlimited power in his own hands'. (*Political Will*, 1923)

The 1923 German revolution was directed from the Kremlin, but a fierce fight over who should control the world revolution was already under way. Not one of the evident claimants for power wanted to see his opponent in the role of leader of the German and therefore the European revolution. They jostled one another at the helm, issuing conflicting instructions to their subordinates. No one in such circumstances would end as victor. Wisely, Stalin did not join the helmsmen in their scramble for power. Instead, he decided first of all to devote his entire attention to consolidating his personal authority beyond all dispute.

In the years which immediately followed, Stalin demoted from the highest level of the Party all those who aspired to the post of leader, pushing them down to increasing depths until they ended up in the cellars of the Lubyanka jail. Once he had seized power, Stalin removed all obstacles standing in the way of the German revolution. He brought order to the German Communist Party and compelled it to carry out Moscow's instructions without question. He established a common frontier with Germany. He annihilated German social democracy. His position was both simple and based upon principles: it was necessary to fight against the Social Democrats and the pacifists, who were distracting the proletariat from revolution and war. On 7 November 1927, Stalin launched a slogan which said, 'It is impossible to finish with capitalism without first finishing with social democratism in the workers' movement.' (*Pravda*, No. 255, 6/7 Nov 1927) The following year Stalin declared that the communists' main task was to fight against social demo-

cracy : 'first of all, the struggle with social democratism along all lines, including and following from this the exposure of bourgeois pacifism'. (Stalin, *Sochineniya*, Vol. 11, p. 202) Stalin's attitude towards those who openly favoured war with, for example, the German Nazis, was just as simple and understandable. The Nazis had to be supported: leave it to the Nazis to eliminate the Social Democrats and the pacifists; let the Nazis start another war and destroy every state in Europe, every political party, every parliament, every army and every trade union. In 1927 Stalin already foresaw that the Nazis would come to power and he considered that this would be a positive event. 'It is precisely this fact which will lead to an exacerbation of the internal situation in the capitalist countries and to the workers coming out in favour of revolution.' (Stalin, *Sochineniya*, Vol. 10, p. 49)

Stalin supported the Nazis. Zealous Stalinists, such as Herman Remmele, who was a member of the Politburo of the German Communist Party, was quite open in his support of the Nazis, then eager for power. The part which Stalin played in the Nazis' seizure of power in Germany was considerable. As Leon Trotsky said in 1936: 'Without Stalin there would have been no Hitler, there would have been no Gestapo!' (*Bulletin of the Opposition (BO)*, Nos. 52-53, October 1936) Another statement he made in November 1938 reveals Trotsky's shrewdness and his knowledge of the point at issue. 'Stalin finally untied Hitler's hands, as well as those of his enemies, and thereby pushed Europe towards war.' He said this at a time when Chamberlain was rejoicing that there would be no war, Mussolini was regarding himself as a peacemaker and Hitler still had no intention of issuing a directive to attack Poland, even less France. At the moment when Europe was heaving a sigh of relief in the belief that there would be no war, Trotsky already knew both that war would quickly come and who would be to blame for it.

On 21 June 1939, intensive negotiations directed against Germany were then taking place between Britain, France and the Soviet Union. There was nothing to indicate that any surprises or complications might possibly be in store. 'The Soviet Union,' Trotsky said at the time, 'will move up to the German frontiers in all its massed strength just at the moment when the Third Reich becomes involved in the conflict for a new repartition of the world.' And indeed it was to happen precisely like that. Germany would fight in France, while Stalin, 'with all his massed strength', would crush the neutral countries on his western frontiers, thereby bringing himself nearer to the German border. On that same day of 21 June 1939 Trotsky made an even more extraordinary prophecy — that in autumn 1939 Poland would be occupied and that Germany intended to attack the Soviet Union in autumn 1941.

Trotsky made one minor error in being only a few months out as to when the war would begin against the Soviet Union. We shall see later that Stalin also made the same mistake.

Today, when we read some fifty years later the general pronouncements and predictions which Trotsky made, we can appreciate their accuracy. But this raises the question, how did he know all this? There is nothing secret about Trotsky. He had been one of the leaders of the communist *coup d'etat*. He was the creator of the Red Army and its leader. He had been the Soviet representative at the

negotiations in Brest-Litovsk. He was the first head of Soviet diplomacy. He was, along with Lenin, a recognized leader of the Soviet Union and leader of the world revolution. So he already knew very well what communism was, what the Red Army was and who Stalin was. Trotsky said that all his predictions were based on overt Soviet publications and in particular on the statements of George Dimitrov, the secretary of the Comintern.

Trotsky was the first person to understand Stalin's game, which was not understood by Western leaders, nor in the beginning even by Hitler. The game was quite simple. Trotsky himself became its victim and for that reason understood it. Working in league with Zinoviev and Kamenev, Stalin, creating a new group to activate prejudice against his fellow-revolutionary, removed Trotsky from power. Next, working in league with Bukharin, Stalin removed Zinoviev and Kamenev. Then Stalin kicked out Bukharin as well. Stalin followed this up by using Henrik Yagoda to remove Felix Dzerzhinsky's generation of Chekists. Then, using Nikolai Yezhov as leverage, he discarded Henrik Yagoda and his generation in their turn. With the help of Lavrenty Beria, Stalin finally ousted Yezhov and his generation. Stalin continued to play the same game in the international arena and Trotsky saw this too. For Stalin, German Nazism was an instrument which would break a path for the revolution through the solid ice - an icebreaker. German Nazism could begin the war and the war would lead to revolution. Let the icebreaker break Europe! Hitler could do what it did not suit Stalin to do. Stalin stated in 1927 that the second imperialist war was quite unavoidable, just as unavoidable, in fact, as the entry of the Soviet Union into that war. However, he did not want to take part in it himself from the first day. 'We shall move, but we shall be the last to move, in order to throw our weight on to the scales and tip the balance.' (Stalin, Vol. 7, p. 14)

In Europe Stalin needed crises, wars, destruction and hunger. Hitler could achieve all this for him. The more crimes Hitler committed in Europe, the better it would be for Stalin and the more reason he would have one day to send the Red Army into Europe as her liberator. Trotsky understood all this before the Second World War began and before Hitler became Chancellor. 'Let them come to power,' said Trotsky in 1932, explaining what Stalin's attitude was to the German Nazis, 'let them compromise themselves, and then ...'

From 1927 onwards, Stalin made every effort to support the Nazis who were then striving for power, although he did not of course do so publicly. After 1933, Stalin would do everything possible to push the Nazis towards war. When they entered the war, Stalin would order communists living in democratic countries temporarily to become pacifists, to demoralize the armed forces of the Western countries, to open the way for the Nazis and to capitulate to them with demands that the 'imperialist war' should be stopped, while at the same time undermining the war effort of their own countries and governments.

When he moved his icebreaker - German Nazism - against democratic Europe, Stalin had already passed the death sentence on it. Stalin had been planning to liquidate the Nazis for five years before they took over in Germany. 'Smash fascism, overthrow capitalism, establish Soviet power and free the colonies from slavery.' (Stalin, *Sochineniya*, Vol. n, p. 202)

Fascism was the hangman of Europe. Stalin supported the hangman, but even before the hangman had begun his work, Stalin had prepared the same fate for the hangman as awaited the hangman's victims.

CHAPTER 3

Why Arms for the Communists?

The people perish for want of steel.

Gounod's *Faust*

In 1933, the German colonel (later general) Heinz Guderian visited a Soviet locomotive engineering works at Kharkov. Guderian saw that, in addition to locomotives, the yard was producing tanks as a side product. The tanks were being produced at the rate of 22 a day.

When assessing the output of side products at one Soviet plant in peacetime, it must be remembered that in 1933 Germany was producing no tanks at all. In 1939, Hitler came into the Second World War with 3,195 tanks, that is, less than the Kharkov locomotive engineering works, working on a peacetime footing, produced in six months. When assessing the significance of an output of 22 tanks a day, it must also be borne in mind that in 1940, even after the Second World War had begun, the United States had *in all* only about 400 tanks.

What of the quality of the tanks which Guderian saw at the Kharkov engineering works? They were tanks which had been created by that American tank genius, J. W. Christie. Nobody, apart from the Soviet tank makers, appreciated Christie's achievements. One of Christie's American tanks was bought in the United States and sent to the Soviet Union under false documentation; the tank was described as an agricultural tractor. The 'tractor' was then produced in large numbers in the Soviet Union as a Mark BT - initials for the Russian words 'high-speed tank'. The first Mark BTs had a speed of 100 kilometres per hour. In the present day, there is not a tank crew anywhere which would not envy such a speed.

The shape of the hull of the Mark BT tank was simple and efficient. No tank at that time, not even those being produced for the United States Army, had a similar form of armament. The best tank in operation during the Second World War was the T34, a direct descendant of the Mark BT. The shape of its hull was a further development of the ideas of the great American tank builder. The principle of mounting its front armour plating in a sloping position was used, after the T34, on the German Panzer tank and then on all other tanks subsequently produced elsewhere in the world.

In the 1930s, practically all tanks in all tank-producing countries were designed and produced with the engine at the rear and the transmission system at the front. The Mark BT was an exception to this rule. The engine and the transmission system were both in the rear. It would take another quarter-century before the rest of the world understood the advantages of this structure.

The Mark BT tanks were continuously being improved. Their radius of action on one fuelling was increased to 700 kilometres. Fifty years later this is still a dream for the majority of tank crews. In 1936, Mark BT tanks produced in series were fording deep rivers underwater and along the river beds. Even now, at the end of the twentieth century, not all tanks used by the probable enemies of the Soviet Union have the same capability. Installation of diesel engines on the Mark BT tanks began in 1938. This was done elsewhere only ten or twenty years later. Finally, the Mark BT tank carried a weapons system which was very powerful for that time.

Having said so many positive things about the numbers and quality of Soviet tanks, one must note one minor drawback. It was impossible to use these tanks on Soviet territory.

The basic characteristic of the Mark BT tank was its speed. The quality so dominated all its other characteristics that it was even used in the name it was given.

The Mark BT is an aggressor tank. In all its characteristics, it is remarkably similar to the small but completely mobile cavalry warrior who emerged from the countless hordes of Genghis Khan. This great world conqueror vanquished all his enemies by delivering lightning strikes with great masses of exclusively mobile troops. Genghis Khan destroyed his enemies not, in the main, by force of arms, but by swift manoeuvre in depth. Genghis Khan did not need slow, sluggish knights, but hordes of light, fast-moving troops, capable of covering vast distances, fording rivers and moving deep into the rear of enemy territory.

That was just what the Mark BT tanks were like. By 1 September 1939, more of them had been produced than any other tank of any other type by any other country anywhere else in the world. The mobility, speed and radius of action were bought at the price of lighter and less thick, though still efficient armour. Mark BT tanks could only be used in an aggressive war, only in the rear of the enemy and only in a swift offensive operation, in which masses of tanks suddenly burst into enemy territory, bypassing his centres of resistance and racing into the depth of his heartland, where there were no enemy troops, but where his towns, bridges, factories, aerodromes, ports, depots, command posts and communications centres were situated.

The strikingly belligerent qualities of the Mark BT tank were also achieved by means of using a unique system of tracks and suspension. On unmade roads, the Mark BT operated on heavy caterpillar tracks, but once on a good road, the tracks were discarded and it then shot ahead on wheels, like a racing car. It is, however, well known that speed is not compatible with crosscountry performance. The choice is therefore between, on the one hand, a high-speed car which will go only on good roads, or on the other, a

slow-moving tractor, which will go anywhere. The Soviet marshals favoured the high-speed car. Thus, the Mark BT tanks were quite powerless on Soviet territory. When Hitler began Operation Barbarossa, practically all the Mark BT tanks were cast aside. It was almost impossible to use them off the roads, even with caterpillar tracks. They were never used on wheels. The potential of these tanks was never realized, but it certainly could never have been realized on Soviet territory. The Mark BT was created to operate on foreign territory only and, what is more, only on territory where there were good roads, as already observed.

Let us glance at the Soviet Union's neighbours. Then, as now, there were no good roads in Turkey, Iran, Afghanistan, China, Mongolia, Manchuria, or Northern Korea. Zhukov used Mark BT tanks in Mongolia, where the terrain is as flat as a billiard table. However, he used them only with caterpillar tracks and was dissatisfied with them. Off the roads, the tank tracks often raced round without gripping the surface, while the wheels, because of the comparatively great pressure they had to bear, whether they were off the road or even on unmade roads, simply spun round and sank into the earth while the tank remained stationary.

To the question, where could the enormous potential of these Mark B T tanks be successfully realized, there is only one answer: in central and southern Europe. The only territories where tanks could be used, *after* their caterpillar tracks were removed, were Germany, France and Belgium. To the question as to which is more important for the Mark BT tanks, the wheels or the caterpillar tracks, Soviet textbooks of that period give a clear-cut answer: the wheels. The most important characteristic of the MarkBT, speed, is attained on wheels. Caterpillar tracks are only a means for reaching foreign territory. For instance, Poland could be crossed on caterpillar tracks which, once the German auto-bahns had been reached, could then be discarded in favour of wheels, on which operations would then proceed. Caterpillar tracks were regarded as an auxiliary device which was supposed to be used only once in war, then to be discarded and forgotten. It is exactly like the parachutist who uses his parachute for the sole purpose of landing in enemy territory. Once there, he throws the parachute away so that he can operate without being burdened by a heavy load which he no longer needs. It was precisely this attitude which was adopted towards caterpillar tracks. Those Soviet divisions and army corps which were equipped with Mark BT tanks did not have on their complement any vehicles whose purpose it was to recover the caterpillar tracks which had been thrown away and bring them back. After the Mark BT tanks had discarded their tracks, they had to finish the war on wheels.

Some types of Soviet tanks were named after communist leaders, like the 'KV', for Klim Voroshilov,³ and the 'JS', for Joseph Stalin. Most Soviet tanks, however, were given a designation which contained the index letter 'T'. Sometimes, in addition to 'T', the index

³ Voroshilov was first a Marshal of the Soviet Union, one of Stalin's closest allies; he later became Chairman of the Supreme Soviet.

included the letter 'O' (which stands for the Russian word for 'flame-throwing'), 'B' (the initial letter of the Russian word for 'high speed') or 'P' (indicating 'amphibious'⁴).

Then in 1938, the Soviet Union began to work intensively on the production of a tank which bore the highly unusual index number of A-2O. What does 'A' mean? There is not one Soviet textbook which gives the answer to this question and to date it remains undeciphered by many experts. For a long time I sought an answer and finally found it at Factory No. 183. This plant produced locomotives, but had other, less 'peaceful' production on the go at the same time. People with great experience at this plant say that the original meaning of the index letter 'A' in this case stood for '*Autostradnyi*' — motorway. Personally I find this explanation convincing. The Mark A-20 tank was the latest development in the Mark BT family. The main characteristic of the Mark BT figured in its name, so why should the main characteristic of the Mark A-2O not be expressed in the same way? The purpose, I suggest, of the Mark A-20 was to reach the motorways on its caterpillar tracks and, once there, to discard the tracks, and convert itself into the king of speed.

At the end of the twentieth century the Soviet Union does not have one kilometre of highway which can be even remotely described as a motorway. Fifty years ago, and for long after that, there were no motorways in Soviet territory. Nor were there motorways in any of the countries which bordered the Soviet Union in 1938. One year later, however, in 1939, Stalin partitioned Poland under the Molotov-Ribbentrop pact and thereby established a common frontier with a country which *did* have motorways. That country was Germany.

It is said that Stalin's tanks were not ready for war. That was not so. They were not ready for a *defensive* war on their own territory. They were, however, designed to wage war on others.

As it was for Soviet tanks, so it was for Soviet aircraft in both quality and numbers. Communist falsifiers of the facts say nowadays that the Soviet Union did of course have many aircraft, but the majority were inferior. They were obsolete planes and they therefore could be disregarded. Let us consider only the contemporary Soviet aircraft - the MIG-3, the Y A K-1, the PE-2, the IL-2; in doing so we shall in no way find ourselves discussing antiquated flying machines.

⁴ The Soviet Union was the only country in the world which produced amphibious tanks in massive numbers. In a defensive war, there is no need for a tank to pass over water. Therefore, when Hitler set Operation Barbarossa in motion, Soviet amphibious tanks had to be discarded because they were unsuitable for defensive warfare. Their production, like the production of the Mark BT tanks, stopped immediately.

Alfred Price was a British airman who, throughout his lifetime, flew 45 types of aircraft and logged more than 4,000 flying hours. This is what he thought of these 'antiquated flying machines':

The most heavily armed fighter in service in September 1939 was the Russian Polikarpov I-16, a progressive development of an aircraft which had first entered service in 1934 and fought in the Spanish Civil War ... In terms of armament. . . it had never been surpassed. The I-16 Type 17, which appeared in 1938, carried two synchronized 7.62 ShKAS machine guns on top of the engine cowling and two 20mm ShVAK cannon in the wings. The ShKAS had a rate of fire of 1,600 rounds per minute after synchronization and a muzzle velocity of 2,700 feet per second; the ShVAK had a rate of fire of 800 rounds per minute and a muzzle velocity of 2,600 feet per second. In both cases these figures were better than those for any comparable weapon and they conferred upon the Type 17 a weight of fire of more than double that of the Messerschmitt 109E-I and nearly three times that of the Spitfire. The hefty punch of this tubby Russian fighter was years ahead of its time . . . Those who believe that the Russians were backward peasants prior to the Second World War and advanced after it only because they were able to make use of German expertise might care to ponder these points. (Alfred Price, *World War II Fighter Conflict*, London 1975; pp. 18-21)

To this it must be added that in August 1939, Soviet fighters were the first aircraft in the world to use rockets as armaments in combat conditions. What is more, Soviet aircraft builders had created a plane, unique in the world, which had an armoured fuselage. The IL-2 was virtually a flying tank, with super-high-powered weaponry by any standard, including eight heavy rocket shells.

What does all this mean? Why was it that from the very first day of the war the Soviet Air Force yielded mastery in the air to the enemy? The answer is simple. Most Soviet pilots, including fighter pilots, had not been trained to fight air battles. So what had they been trained to do? They had been trained to strike at ground targets. The regulations of the Soviet fighter and bomber Air Force (BUFA-40 and BUBA-40) pointed Soviet pilots towards staging one grandiose, lightning offensive operation, in which the air force would catch the enemy air force napping with one blow and seize supremacy of the air. Even in 1929, the Soviet magazine, *War and Revolution*, published a basic article entitled 'The Initial Period of War'. This drew the conclusion, to be repeated in Soviet Air Force regulations, including those of 1940 and 1941, that 'it is highly advantageous to take the initiative and be first to attack the enemy. Once the air force has taken the initiative in attacking the airfields and hangars of the enemy, it can then count upon having supremacy in the air.' (*War and Revolution*, No. 9, pp. 19-20 (1929)) The Soviet air theoreticians did not have in mind some general enemy, but a clearly defined one. Alexander Lapchinsky, the chief Soviet air strategist, illustrated his books with very detailed maps of standard bombing targets. These included the railway junction at Leipzig, at the Friedrichstrasse in Berlin and its railway station, and other

such places. In explaining how Soviet territory had to be defended, Lapchinsky said 'a determined ground attack attracts enemy air forces towards itself like a magnet and serves as the best means of defending the country from them. The air defence of the country is not a manoeuvre from depth, but a manoeuvre into depth.' (*Vozdushnaya Armiya*, Alexander Lapchinsky, Moscow 1939; pp. 176-7) It was precisely for this purpose in 1941 that the entire Soviet Air Force was concentrated on the very frontiers of the country. For example, the field aerodrome of the 123rd Fighter Regiment was only two kilometres from the German frontier. In battle conditions an aircraft, in order to save fuel, takes off towards the enemy. Aircraft of the 123rd Regiment, like many others, were thus compelled to gain height after takeoff by flying over German territory.

Both during the war and after it, the Soviet Union built quite a few aircraft which were, at the same time, excellent and surprisingly simple. The greatest achievements of the Soviet Air Force, however, were not in building aircraft which would destroy enemy planes in the air. They lay in the building of aircraft which would destroy planes and other enemy targets on the ground. The IL-2 was in just such a category. Airfields were its most important targets. When he had created this aggressor aircraft, Sergei Ilyushin stipulated one minor defensive detail. The first model of the IL-2 had two seats. From one, the pilot flew the aircraft and attacked his targets, while seated behind him in the other the air gunner protected the rear of the aircraft from enemy fighter attack. Stalin personally telephoned Ilyushin and ordered him to discard the rear gunner and his machine gun, and to produce the IL-2 as a one-seater aircraft. Stalin, it seemed, needed the IL-2 for a situation in which not one enemy fighter would succeed in taking off. After Operation Barbarossa had been launched, Stalin rang up Ilyushin again and ordered him to produce the IL-2 as a two-seater aircraft, as before. In a defensive war even aggressor aircraft need to have some defensive armaments.

1927 was the year when Stalin took his place, finally and permanently, at the summit of power. From then onwards, he concentrated his attention not only on consolidating his dictatorship, but also on the problems of the whole communist movement and world revolution.

1927 was the year in which Stalin finally drew the conclusion that the Second World War was inevitable; that there had to be a decisive conflict with social democratic pacifism which was delaying its start; and that the Nazis, striving for power, had first to be supported and then destroyed.

The same year also marked the beginning of the industrialization of the Soviet Union. This was done through a series of five-year plans, the first of which began in 1927.

When the first five-year plan began, the Red Army had 92 tanks. When the plan was completed, it had more than 4,000. Even so, the military bias in the first five-year plan was not very noticeable. Most attention was paid to the industrial base which was to be created and which would subsequently produce arms, rather than to arms *per se*.

The second five-year plan continued the development of the industrial base. It produced coke ovens and open-hearth furnaces, great electrical power stations and oxygen plants, rolling and blooming mills, mines and pits. The production of arms was not yet the important issue. Even so, Stalin was not losing sight of it. 24,708 military aircraft were produced during the first two five-year plans.

Then came the third five-year plan, which should have been completed in 1942. This was the plan to turn out actual military products in enormous quantities and of very high quality.

Industrialization was bought at a high price, however. Stalin let the standard of living of the populace fall to a very low level. Vast reserves of gold, platinum and diamonds were sold to foreign markets. Churches and monasteries, imperial repositories and museums, were pillaged. Icons and valuable books were put on the foreign market. Paintings by the great masters of the Renaissance, collections of cut diamonds, and treasures from museums and libraries were all given over to export. Similarly, Stalin forced timber and coal, nickel and manganese, oil, cotton, caviar, furs, grain and much more on to the export market.

Then, in 1930, he began his notorious collectivization programme. The peasants were driven by force into collective farms, so that all their crops could be taken from them without payment. In communist jargon this was called 'transferring resources from agriculture to heavy industry'. The result of collectivization and the hunger which followed it was ten to sixteen million dead. Stalin, meanwhile, went on, throughout this period, selling five million tons of grain every year abroad.

Why was collectivization needed? For industrialization. Why industrialization? Not, in any way, to raise the standard of living of the nation. Life during the NEP, and before industrialization and collectivization, had been perfectly tolerable. Had Stalin been interested in the standard of living of the people, then he needed neither industrialization nor collectivization. He needed simply to preserve the NEP. Living standards now, however, reached an awesomely low level. Robert Conquest has recently published a book, *The Harvest of Sorrow* (1987), on these fearsome five-year plans, complete with pictures showing skeleton-like children. They portray a situation as bad as, if not worse than, those we have witnessed in communist Ethiopia or Pol Pot's Cambodia in recent times.

Industrialization and collectivization were intended to produce arms in vast quantities. Why did the communists want arms? To defend the people? The answer is no. If Stalin had sold only four million tons of grain a year instead of five for his motorway tanks, parachute silk and Western military technology, millions of children would not have died. Weapons are used in all countries to defend the population from appalling calamities - above all, their children, who are a nation's future. In the Soviet Union, it was the other way

round. In order to obtain arms, the populace, children included, were subjected to fearful disaster. Just one statistic will serve to underline its scale. In World War I Russia lost in all 2.3 million people. In *peacetime*, however, Stalin was responsible for the destruction of approximately five to seven times more people for the sake of acquiring motorway tanks and offensive aircraft. The communist turned out to be many times more terrible than the imperialist war.

The growth in Soviet military might was in no way dictated by an external threat, for it began before Hitler came to power. The annihilation of millions of children for the sake of obtaining armaments was going on whilst Stalin was making strenuous efforts to suppress western pacifists and at the same time raising up the Nazis. It may be objected that while Stalin sacrificed millions of people, he nevertheless created arms to defend the survivors. This is not valid. We have already seen, and shall see again, that the arms created were in no way suitable for the defence of his territory nor the protection of his people; indeed, he would be compelled either to use them in a way for which they were not intended, or to discard them altogether.

For precisely what, then, were these vast arsenals of arms intended, if not for the defence of the Soviet territory or populace?

CHAPTER 4

Why Stalin Partitioned Poland

*We are doing something which, if it succeeds, will
overturn the whole world and liberate the entire
working class.*

STALIN (*Sochineniya*, Vol. 13, p. 41)

On 22 June 1941, Nazi Germany suddenly attacked the Soviet Union. That is a historical fact. It is, however, a very strange fact. Before the Second World War, Germany did not have a common frontier with the Soviet Union. Consequently, Germany could not then have *made* an attack, still less a sudden one.

Germany and the Soviet Union had been separated by an uninterrupted buffer of neutral states. Before a Soviet—German war could take place, one condition above all others was necessary. The buffer of neutral states had to be destroyed. But who exactly destroyed this buffer; and why?

The buffer between Germany and the Soviet Union consisted for most of its length of at least two countries. Only at one point was it formed by one country: Poland. Poland was the shortest, most direct, most level and most convenient route lying between the Soviet Union and Germany. It was the narrowest part of the dividing wall. It is not hard to understand that it is precisely through here that any potential aggressor, intent on a Soviet—German war, would have to try to force a corridor. On the other hand, if either the Soviet Union or Germany did not want such a war, they would have to use all the strength of their armed forces, all of their national wisdom and all the force of their international authority to keep the enemy off Polish territory. If the worst came to the worst, war would have to be waged in Poland itself, so as to prevent an approach towards either frontier.

Hitler had declared his warlike intentions quite openly. Stalin was quick to call him publicly, a cannibal. Hitler of course could not attack Stalin, since they did not share a common frontier. So Hitler proposed to

Stalin that they make a joint effort to breach the wall that divided them. Stalin accepted this proposal with delight. He knocked down the Polish wall with enormous enthusiasm and forced a corridor in Hitler's direction. Hitler's motives towards Poland, as laid out in *Mein Kampf*, are understandable. But how can Stalin's actions be explained?

The first explanation, according to Soviet propagandists, is that, after having torn Poland to pieces and drowned it in blood, USSR moved her frontier westwards, that is, strengthened her security. This is a strange explanation. The Soviet frontier was indeed moved westwards by 200-300 kilometres, but at the same time Germany moved its frontier some 300-400 kilometres eastwards. As a result of this, the security of the Soviet Union was not enhanced; on the contrary, it was diminished. But this apart, there was an entirely new factor. This was the common Soviet-German frontier and hence the direct possibility of war, including a war of surprise attack.

The second explanation is that by stabbing Poland in the back at a time when she was engaged in a desperate struggle with the Nazis, USSR tried to *delay* the outbreak of the Soviet—German war. This is like saying that USSR started a fire in her neighbour's house in the expectation that it would not spread to hers.

The third explanation is that the unwillingness of France and Britain to sign a treaty with the USSR left Stalin with no option but to come to terms with Hitler. But why should France and Britain defend the Soviet Union, when the Soviet Union had proclaimed that its main aim was to overthrow democracy everywhere, including in France and Britain? The West did not care whether Hitler went east or not. The countries of Eastern Europe certainly did. If Hitler turned eastwards, they would be his first victims. Therefore the Eastern European countries were the natural allies of the Soviet Union. An alliance should be sought with them against Hitler. But Stalin did not seek such alliances. In cases where treaties did exist, the Soviet Union did not carry out her obligations. Stalin could have remained neutral, but chose instead to stab in the back those countries engaged in a struggle with fascism.

Once he had forced a corridor through the dividing wall, Hitler thought that he had done enough. He then turned his attentions to Western Europe, Africa, the Mediterranean and the Atlantic. What ought Stalin to

have done, faced as he was with a breach in the wall some 570 kilometres wide and time in hand? He should have hastily reinforced his defences. The old frontier was a powerful line of fortified regions. It should have been strengthened and improved without delay. In addition to this, a second line of defence should have been built, and a third, and a fifth, and more. Mines should have been laid at once on roads, on bridges and in fields. Anti-tank ditches should have been dug and given anti-tank artillery cover. But none of this happened. Some time later, in 1943, the Red Army was preparing to repel an enemy attack in the Kursk Salient. Within a short period of time, Soviet troops succeeded in creating six continuous defensive strips - one behind the other - on a vast front, to a total depth of 250-300 kilometres. Each kilometre was saturated with trenches, dugouts, communication trenches, concealment shelters and gun positions. The average density of anti-tank and anti-infantry mines per kilometre was as high as 7,000, while the density of anti-tank weaponry reached the exceptionally high level of 41 guns in every kilometre, not counting field and anti-aircraft artillery, and tanks, dug into the ground. Thus a truly impenetrable defence was set up from scratch in a very short space of time in the open field.

In 1939 conditions which favoured defence were considerably better than in 1943. There were impassable forests, rivers and marshes. There were few roads and a lot of time. Nevertheless, at that moment the Soviet Union stopped producing anti-tank and anti-aircraft guns. Instead of rendering the area impassable, it was immediately made more passable. Roads and bridges were built in it, and the railway network was extended, strengthened and improved. Previously existing fortifications were demolished and covered with earth.

Ilya Starinov, a GRU colonel involved in this process, described what he saw:

The situation was becoming absurd. When we were faced by weak armies of comparatively small countries, our frontiers were really well and truly safe. When Nazi Germany became our neighbour the defensive installations put up by the engineers along the former frontier were abandoned and even partially dismantled. (I. Starinov, *Miny Zhdut Svoego Chasa*, p. 186)

The military engineering directorate of the Red Army indented for 120,000 delayed-action railway mines. In the event of an invasion by the German Army, this quantity would have been quite sufficient to paralyse the

entire railway network behind enemy lines, upon which the Germans would have been totally dependent. But instead of the number of mines ordered, only 120 arrived. (Starinov, *op. cit.*) Yet the mine is a very simple, very cheap and very effective weapon. The production of mines in the Soviet Union was enormous, but it was curtailed after the passage had been forced through the wall.

One breach in the wall was enough for Hitler. It was not enough for Stalin. Hitler, with Stalin's help, destroyed the authority of the state in only one country forming part of the dividing buffer. Stalin, without anybody's help, achieved this in three other countries, Latvia, Lithuania and Estonia, attempted to do the same in a fourth, Finland, and actively prepared to repeat the performance in a fifth country, Romania, after having seized a vast tract of Romanian territory. Only ten months after the 'non-aggression' pact was signed and by Stalin's own efforts, the dividing buffer from the Arctic Ocean to the Black Sea had been completely shattered. There no longer remained any neutral countries between Stalin and Hitler and thereby the conditions needed for attack were created.

During this short space of time, all of Stalin's western neighbours had become his victims. The appearance of Soviet troops in Lithuania meant that they had moved on to the real German frontier. Previously, the Soviet-German border passed through Polish-occupied territory. Now, Soviet troops had moved on to the frontier with East Prussia.

Communist historians have tried, though without any success, to devise answers to the question as to why Stalin agreed to help Hitler force a corridor through Poland. The question as to why Stalin smashed the entire buffer is one which they prefer not to raise. But Stalin himself gave a clear and precise answer to *that* unasked question:

History states [wrote Stalin] that when one country wants to go to war with another, even one which is not a neighbour, then it begins to seek frontiers across which it would be able to reach the frontiers of the countries it wishes to attack. (*Pravda*, 5 March 1936)

Did the Red Army intend to stop on the borders once it had reached them?

Here is S. K. Timoshenko, Marshal of the Soviet Union, on the subject:

In Lithuania, Latvia and Estonia, the power of the landowners and capitalists, so hateful to the workers, has been abolished. The Soviet Union has grown significantly and has moved its frontiers westwards. The capitalist world has been compelled to yield and give ground. But it is not for us fighters of the Red Army to give ourselves airs or rest on our laurels! (*Order of the People's Commissar of Defence*, No. 400, 7 November 1940)

This is neither a speech nor a Tass report. It is an order of the Red Army. To the west of the Soviet borders lay only Germany and countries allied to her. Could the frontiers be moved further westward, at the expense of Germany?

CHAPTER 5

The Pact and its Results

Stalin was more cunning than Hitler, more cunning and more perfidious.

ANTON ANTONOV-OVSEENKO

(The Portrait of a Tyrant, New York 1980; p. 296)

Outwardly everything seemed equitable, a part of Poland for Hitler and a part for Stalin. However, just one week after the signing of the Pact, Stalin played his first dirty trick. Hitler began the war against Poland, while Stalin stated that his troops were not yet ready. He could have told Ribbentrop that before the Pact was signed, but he did not do so.⁵ Hitler began the war and found himself on his own. The result? He, and he alone, was branded the perpetrator of the Second World War.

Once he had begun the war against Poland, Hitler immediately found himself at war with France, that is, at war on two fronts. Every German schoolboy knew how a war on two fronts would turn out in the end for Germany.

Britain at once declared war on Germany. France could be dealt with, but Britain was an island. In order to reach it, long and serious preparations were necessary. A powerful fleet, roughly equal in strength to the Royal Navy, was also needed, as well as supremacy in the air. The war was thus already changing into what would become a long, drawn-out conflict.

Standing behind Britain was the United States which could, as it did in World War I, throw its inexhaustible power on to the scales at the most vital moment. The whole of the West became Hitler's enemy.

⁵ Known as the 'Non-Aggression Pact', which, by dividing Poland between the Soviet Union and Germany, was instrumental in the start of World War II.

Hitler could count on Stalin's friendship only so long as he was in a position of strength. In a protracted war against the West, Stalin would, of course, be obliged to dissipate this strength.

As far as Stalin was concerned, Poland had been partitioned, not in the Chancellery in Berlin, but in the Kremlin in Moscow. In effect, Stalin got the war he wanted, with a western nation destroying others around it, while Stalin remained neutral, biding his time. When, later, he got into serious difficulties, Stalin at once received help from the West.

In the end, however, Poland, for whose liberty the West had gone to war, ended up with none at all. On the contrary, she was handed over to Stalin, along with the whole of Eastern Europe, including a part of Germany. Even so, there are some people in the West who continue to believe that the West won the Second World War.

Hitler committed suicide; Stalin became the absolute ruler of a vast empire hostile to the West, which had been created with the *help* of the West. For all that, Stalin was able to preserve his reputation as naive and trusting, while Hitler went down in history as the ultimate aggressor. A multitude of books have been published in the West based on the idea that Stalin was not ready for war while Hitler was. In my view, the man who is ready for war is not the one who loudly proclaims himself prepared for it, but the man who wins it — by dividing his enemies and knocking their heads together.

Did Stalin intend to observe the Pact? Let Stalin speak:

The question of conflict must not be considered from the point of view of justice, but from the point of view of the demands of the political factor, from the point of view of the political demands of the Party at any given moment. (Speech to a session of the executive committee of the Comintern, 22 January 1926)

War can turn each and every agreement upside down. (Pravda, 15 September 1927)

The Party, in congresses at which Stalin spoke, correctly understood its leaders and gave them the appropriate, full authority:

The Congress stresses in particular that the Central Committee is given full powers at any moment to break all alliances and peace treaties with imperialist and bourgeois states and equally to declare war on them. (Resolution of the 7th Party Congress)

Incidentally, this Party decision has never been rescinded.

According to Stalin, 'A great deal depends upon whether we succeed in delaying the war, which is unavoidable, with the capitalist world, until that moment when the capitalists start fighting among themselves.' (*Sochineniya*, Vol. 10, p. 288) And: "The decisive battle can be considered imminent when all the class forces hostile to us have become sufficiently entangled with each other, when they are fighting sufficiently with each other, and when they have weakened each other sufficiently for the conflict to be beyond their strength.' (*Sochineniya*, Vol. 6, P- 158)

Stalin needed a situation in which 'the capitalists will fight each other like dogs'. (*Pravda*, 14 May 1939) The Molotov-Ribbentrop pact created just that situation. Quotations like these could be glimpsed in *Pravda*: 'Not only must they be taken by the throat, they must be destroyed.' (Marx, Vol. 2, p. 343) *Pravda* was transported with delight. The foundations of the earth are trembling,' it wrote. 'The ground slips from under the feet of peoples and nations. Glows are afire in the sky and the thunder of guns shakes seas and continents. Powers and states are blown away just like chaff in the wind. How excellent it is, how extraordinarily wonderful, when the world is shaken to its very foundations, when powers perish and greatness falls.' (*Pravda*, 4 August 1940) 'Every such war brings us closer to that happy time when murders among the people will no longer happen. (*Pravda*, 18 August 1940)

These sentiments spread from the very top down through the ranks of the Red Army and the Party. Lieutenant-General S. Krivoshein described a conversation he had with Peter Latyshev, his deputy. Krivoshein was commanding the 25th Mechanized Corps at the time. Shortly before, he had been in charge, along with

General Guderian, of the joint Nazi-Soviet parade in Brest-Litovsk to mark the partition of Poland. 'We have concluded a treaty with the Germans', he said, 'but this means nothing. Now is the most wonderful time to solve all world problems once and for all, and in a constructive way.' (*Ratnaya ByV*, Molodaya Gvardiya, 1962, p. 8) Krivoshein turned everything into a joke after the event. It is interesting that jokes of this kind were circulating in his Corps and indeed throughout the Red Army. Nobody seriously discussed whether the Corps and the entire Red Army had been prepared for defence.

Leonid Brezhnev himself has spoken of the way in which Soviet communists believed in the Non-Aggression Pact and the manner in which they intended to observe it. He described a meeting of Party agitators which was held in Dnepropetrovsk in 1940:

'Comrade Brezhnev, we have to interpret non-aggression and say that it has to be taken seriously, and that anyone who does not believe in it is talking provocation. But people have little faith in it. So what are we to do? Do we go on interpreting it or not?'

It was quite a delicate moment. There were 400 people sitting in the hall, all waiting for me to answer. I had very little time to think.

'You have got to go on interpreting it,' I said, 'and we shall go on interpreting it until not one stone of Nazi Germany remains upon another.' (Leonid Brezhnev, *Malaya Zemlya*, Moscow, 1978, p. 16)

It occurred to Stalin that the situation in which 'not one stone of Nazi Germany remains upon another' would come about in 1942. But the rapid fall of France and Hitler's refusal to land in Britain (Soviet military intelligence knew about this at the end of 1940) rearranged all the cards which Stalin held in his hand. The liberation of Europe was brought forward from the summer of 1942 to the summer of 1941. The new year of 1941 was therefore greeted with the slogan, 'Let us increase the numbers of republics in the Soviet Union!'

Wielding our spades, in Forty-One, we'll find
The wealth of Earth, which lies in virgin layers;
Uranium, by cyclatron enlivened,

Becomes a simple fuel for every day.
Each year for us is victory, a battle,
For coal, for sweeps of metallurgy galore,
To sixteen coats of arms, perhaps, are added,
New coats of arms-of these will have still more . . .
(*Pravda*, 1 January 1941)

They were not thinking about defence. They were not preparing for it, nor had they any intention of preparing for it. They were fully aware that Germany was already at war in the West and for that reason would not begin a war in the East. They knew full well that war on two fronts would be suicide for Hitler.

On no occasion before the war did *Pravda* ever call on the Soviet people to strengthen its *defences*. Indeed, *Pravda's* tone was quite different:

Our country is large; the globe must revolve for nine hours before the whole of our vast Soviet land can enter the new year of our victories. The time will come when not nine hours, but all the twenty-four hours on the clock will be needed for this to happen . . . Who knows where we shall be greeting the new year in five or ten years' time - in what latitude, on what new Soviet meridian? (*Pravda*, 1 January 1941)

The nearer the date of the Soviet invasion of Europe approached - July 1941 - the more explicit *Pravda* became:

Divide our enemies, meet the demands of each of them temporarily and then destroy them one at a time, giving them no opportunity to unite. (*Pravda*, 4 March 1941)

Hitler decided that it was not worth his while waiting any longer. He was the first to go, without waiting for the blow of the 'liberating' dagger to stab him in the back. He had begun the war in the most favourable

conditions which could possibly have existed for an aggressor; but given the nature of Stalin's grand plan, he could never have won it. Even in the most unfavourable conditions, the Red Army was able to 'liberate' half of Europe and has held it in subjugation to this day. We must wonder how would it have turned out had the best German forces left the Continent in the early stages of the war to go off to Africa and the British Isles, leaving the Red Army to move in behind their backs to destroy Germany's only source of oil.

CHAPTER 6

When Did the Soviet Union Enter World War II?

*In the event of a general conflict, only one country
can win. That country is the Soviet Union.*

HITLER, 1937 (In conversation
with Lord Halifax, Obersalzberg,
19 November 1937)

Everything in the Soviet Union relating to the beginning of World War II is concealed by the impenetrable darkness of state secrecy. Among the many secrets is one which is especially well kept: the date on which the Soviet Union entered the war.

In order to conceal the truth, communist propaganda has put about the false date of 22 June 1941. Communist writers have thought up a multitude of legends about 22 June. I have even heard it said that the USSR was bent on a 'peaceful' life when it was set upon. If the inventions of Soviet propaganda are to be believed, the Soviet Union did not enter World War II of its own volition, but was forcibly dragged into it.

In order to make this sound plausible, Soviet propaganda has been compelled to buttress this date with special props. On the one hand, the 'pre-war period' was devised to include the two years preceding 22 June, while on the other, we have the invented figure of '1,418 days of war'. Counting back from the day when the war in Europe ended, one inevitably comes to rest, according to forged Soviet computations, on 'that fateful Sunday'.

It is, however, easy to debunk the myth of 22 June. All that is needed to do this is to tap gently on one of the supports, that of the 'pre-war period', for example, for the entire structure to collapse, along with that 'fateful' date and the 1,418 days of the 'great motherland war'.

The 'pre-war period' never existed. It was invented. Suffice it to recall that during this period all the European neighbours of the Soviet Union fell victims to Soviet aggression. Moreover, the Red Army certainly had no intention of restricting or stopping its 'liberation campaigns' into the West at that point (Order No.

400, dated 7 February 1940, of the People's Commissar for the Defence of the USSR) although by then only Germany lay to the west of the Soviet Union.

In September 1939, the Soviet Union declared itself neutral and, during the 'pre-war period', seized territories with populations totalling 23 million people - not bad going for a neutral state.

The Red Army and the NKVD perpetrated fearful crimes in these captured territories. Soviet concentration camps were crammed with imprisoned soldiers and officers from a number of European countries. Officer prisoners, and not only the Poles, were shot in their thousands. This is not the action of a neutral state.

Here is a strange state of affairs. Germany attacked Poland, which means that Germany was the instigator of, and participant in, the European and then the World War. The Soviet Union did the same thing in the same month, but it does not judge itself to have been an instigator of the war. Nor does it consider itself even to have then been a participant in the war.

A Polish soldier killed in battle on Polish territory against the Red Army is considered a participant in World War II, as well as its victim, while the Soviet soldier who killed him is regarded as 'neutral'. If in the same battle a Soviet soldier is killed, then it is judged that he has been killed not in wartime but in peacetime -in the 'pre-war period'.

Germany seized Denmark and this was an act of war, even although no great battles were fought. The Soviet Union also seized, without firing a shot, three Baltic states markedly similar to Denmark in geographical position, in size of population, in culture and in traditions. But the actions of the Soviet Union are not judged to be acts of war.

Germany seized Norway. This was a further act of aggression. But before this happened, the Soviet Union had carved up neighbouring Finland. The list of crimes committed by Germany in the war begins on 1 September 1939, while the list of the Red Army's crimes begins for some reason only on 22 June 1941. Why?

During the 'pre-war period', the Red Army lost hundreds of thousands of its soldiers in bitter battles. German Army losses in the same period were considerably less. If one judges from losses alone, Germany had more grounds than the Soviet Union for considering itself neutral in 1939 and 1940.

The official formula used to give a name to these actions of the Soviet Army in the 'pre-war period' is 'strengthening of western frontier security'. This is not true. The frontiers were secure, at a time when the neighbours of the Soviet Union were the neutral states of Europe, while there were no common frontiers with Germany, and when Hitler in consequence was totally unable to launch a general attack, and certainly not a surprise attack, on the Soviet Union. Stalin, however, systematically destroyed several neutral states of Europe, thereby establishing a common frontier with Germany. This was not a way of enhancing the security of the Soviet frontiers.

If we use the formula 'strengthening of western frontier security' to describe aggression against six neutral European states — Poland, Finland, Estonia, Lithuania, Latvia and Romania - why do we not use the same formula in relation to Hitler? Did he not enhance the security of his frontiers by occupying neighbouring countries?

It might be objected that in the 'pre-war period' the Soviet Union did not wage one continuous war, but a series of wars and invasions separated by intervals. But Hitler also waged a series of wars separated by intervals. Why do we use other criteria when judging him?

It is alleged that the Soviet Union did not formally declare war on anybody in the 'pre-war period', therefore it cannot be considered a participant in the war. But Hitler did not always formally declare war. According to the statements made by Soviet propaganda, nobody formally declared war on anybody on 22 June 1941 either. So why is this date accepted as the divide between war and peace?

Soviet propaganda begins its history of the war from the moment when foreign troops appeared on Soviet territory and thus presents the Soviet Union as an innocent victim. Let us stop imagining it as an innocent victim. Let us remember instead those who were really innocent, and who perished in the 'prewar period' on the bayonets of the army of 'liberators'. Let the history of the war be written, not from 22 June, but from the moment when the communist hordes, without any declaration of war, took belligerent action in an already weakened Poland, whose army was trying in a heroic but unequal struggle to stop Hitler's drive to the east. Let the history of the war be written, not just from that day, but from the day on which Stalin himself took the decision to start it.

At dawn on 1 September 1939, the German Army entered Poland. In the twentieth century, war in Europe automatically means world war. So the war in fact quickly laid hold upon both Europe and almost the whole of the rest of the world.

By a strange confluence of circumstances, it was precisely on that very same day of 1 September that the Fourth Extraordinary Session of the Supreme Soviet of the USSR passed a law establishing general liability for military service. Throughout the whole of the Soviet Union's history, there had never been such a law. While Hitler was frightening children (and grown-ups), and was looked upon as a monster and an ogre, the Soviet government had in fact got by without any general military-service liability law. Yet as soon as the Non-Aggression Pact was signed, an act was needed to establish a general obligation to perform military service. September 1939 was the beginning of the phoney war in the West. In the same month, a no less phoney peace began in the East.

Why did the Soviet Union need to impose the general obligation to military service? The communists will answer with one voice that it was needed because the Second World War began that day; they did not want to take part in it, but were simply taking precautionary measures. Marshal of the Soviet Union, K. A. Meretskov, was one of the many who asserted that the law was of great significance and was passed 'in the conditions of World War II which had already begun'. (*Na Sluzhbe Narodu*, IPL, Moscow, 1968 p. 181)

Let us imagine the Polish-German frontier on that tragic morning - darkness, mist, shooting and the roar of engines. There were few in Poland who understood what was happening, whether it was a provocation or an unauthorized clash which had somehow been self-generated. But at the same moment, the deputies of the Supreme Soviet of the USSR - including shepherds from the mountainous pastures high above the cloud level and distinguished reindeer breeders from nomad camps in the Arctic - were assembled in Moscow. *They* already knew that it was neither provocation, nor a clash, nor a Polish-German war, nor even a European war, but the beginning of the Second World War; and they immediately met in emergency session to pass the appropriate laws. Yet how can it be explained why these same deputies did not react with identical swiftness when a similar thing happened on the Soviet-German frontier in 1941?

On that morning of 1 September, it was not only the Polish government and the governments of western countries who did not know that a new world war had begun. Hitler himself did not know it. He began the war against Poland in the hope that it would only be a local action, like the seizure of Czechoslovakia had been. This is not just Goebbels' propaganda. Soviet sources say the same thing: 'Hitler was convinced,' wrote Air Colonel-General A. S. Yakovlev, who was a personal adviser of Stalin's at the time, 'that Britain and France would not go to war over Poland.' (*Tsel' Zhizni*, IPL, Moscow, 1968, p. 212)

Thus Hitler did not know that he was beginning World War II; the comrades in the Kremlin knew it all too well. But it is, of course, a long -way to Moscow. Some deputies needed a week, others as much as twelve days to reach the capital. This means that, in order to discuss the war which had begun in Europe, someone gave the signal to the deputies to gather in the Kremlin *before the war began*. Indeed, I believe that someone gave this signal *even before the Molotov—Ribbentrop pact was signed*.

An attempt to establish the *exact* date on which the Second World War began, and the time when the Soviet Union came into it, inescapably leads us, in fact, to the date of 19 August 1939.

Previously, Stalin had often spoken at secret meetings about his plan to 'liberate' Europe. This was first to involve Europe in war, while he himself remained neutral. Then, when the adversaries had exhausted each other, he would throw the whole power of the Red Army into the balance. (Stalin, Vol. 6, p. 158; Vol. 7, p. 14) The final decision to carry this plan in effect was taken at a session of the Politburo held on 19 August 1939. News about this Politburo meeting and what it had decided reached the Western press immediately. Havas, the French news agency, published a report on the proceedings. Yet how could a record of them fall into the hands of the Western press?

There is no sure answer. It *might* have passed along one of several paths. One of the more probable is this: one or more Politburo members, frightened by Stalin's plans, decided to stop him. They could not protest openly. The only way, therefore, of compelling Stalin to renounce his plans might have been to publish his plans in the West. Members of the Politburo, especially those who controlled the Red Army, the war industry, military intelligence, the NKVD, propaganda and the Comintern, were perfectly able to do it.

Such a scenario is not as fantastic as it might first appear. Zinoviev and Kamenev, who were, in 1917, members of the Politburo, published the plans of Lenin and Trotsky in the bourgeois press in order to disrupt

the October Coup. We still do not know how the document found its way to the West, but there were a variety of ways it could have got there.

Stalin reacted to the Havas agency message with lightning speed and in a highly unusual manner. He published a denial in *Pravda*. It is a serious document and must be read in full:

THE FALSE REPORT ISSUED BY THE HAVAS AGENCY

The editor of *Pravda* has put the following question to Comrade Stalin. What is Comrade Stalin's attitude to the message issued by the Havas agency on 'Stalin's speech', allegedly made by him 'in the Politburo of 19 August', at which ideas were supposedly advanced to the effect that 'the war must be continued for as long as is needed to exhaust the belligerent countries'?

Comrade Stalin has sent the following answer:

'This report issued by the Havas agency, like many more of its messages, is nonsense. I of course cannot know in precisely which nightclub these lies were fabricated. But no matter how many lies the gentlemen of the Havas agency might tell, they cannot deny that

- a) it was not Germany which attacked France and Britain, but France and Britain which attacked Germany, thereby taking upon themselves the responsibility for the present war;
- b) after hostilities began, Germany made peace proposals to France and Britain, while the Soviet Union openly supported these German peace proposals, for it considered, and continues to consider, that only as early an end to the war as possible can bring relief in a fundamental way to the condition of all countries and all peoples;
- c) the ruling circles in Britain and France rejected out of hand both the German peace proposals and the Soviet Union's efforts to end the war as quickly as possible.

Such are the facts. What can the nightclub politicians of the Havas agency provide to counter these facts?' J. STALIN (*Pravda*, 30 November 1939)

Let the reader make up his own mind as to whether the Havas agency report or Stalin's denial is nonsense. Stalin himself, in my view, would hardly have wished to repeat this in his own words in a subsequent period. It is interesting to note that copies of the Pravda issue of 30 November 1939 practically no longer exist in the Soviet Union. I was astonished to discover that there was no copy to be found in the special repository of the GRU archives. It had long since been destroyed. I succeeded in finding a copy only in the West.

The unconcealed mendacity of Stalin's refutation, and his uncharacteristic loss of composure, support the Havas agency version. In this case a nerve of unusual sensitivity was touched and this is why there was such a response to it. During the decades of Soviet power, the Western press wrote a great deal about the Soviet Union and Stalin personally. The Bolsheviki and Stalin himself were accused of every mortal sin. It wrote that Stalin had been an *agent provocateur* for the police, that he had murdered his wife, that he was a despot, a sadist, a dictator, an ogre, a butcher and much more besides. But not once did Stalin become involved in controversy with the 'bourgeois hack writers'. Why then, on only this one occasion, did the normally taciturn and composed Stalin lower himself to indulge in cheap insults? There can only be one answer. The Havas agency had revealed some of Stalin's best-kept secrets. It did not matter to him what future generations might think about his refutation. (They do not, incidentally, think anything of it at all.) What was important to Stalin at that particular moment was that he should keep his plan secret for the next two or three years until the countries of Europe had become weak through involving themselves in a mutually destructive war.

If we are to accept Stalin's arguments and if the Havas agency report did simply consist of lies 'fabricated' in a 'nightclub', we must express our admiration for the Havas agency journalists. If they really did invent their report, then they did so on the basis of a deep knowledge of Marxism-Leninism, of Stalin's character, and of a detailed, scientific analysis of the military and political situation in Europe; indeed, they understood the situation far better than Hitler and the leaders of the Western democracies. If the report *was* invented, then this was an occasion when an invention corresponded entirely to the facts.

Many years later, when the Havas agency report and Stalin's refutation of it had long been forgotten, thirteen volumes of Stalin's essays were published in the Soviet Union. These works include his speeches made at secret sessions of the Central Committee. In 1939 the Havas agency journalists did not have any access to these speeches. But the publication of Stalin's works confirmed that Stalin's plan was simple and one of genius, and that it was exactly as the French journalists had described it. As early as 1927, Stalin

expressed the view at a closed session of the Central Committee that in the event of war it would be essential to remain neutral until the 'warring sides have exhausted each other in a mutual conflict which is beyond their strength to sustain'. This view was often repeated subsequently at closed sessions. Stalin considered that in the event of a war breaking out in Europe, the Soviet Union had to become a participant in it, but it must be the last to enter, right at the end of the game in which the adversary had already been weakened to the point of exhaustion.

Although they both had different attitudes towards Stalin, two of his successors, Khrushchev and Brezhnev, interestingly both confirmed that it had been Stalin's intention to exhaust Europe in war, while preserving his own neutrality, and *then* to 'liberate' it. Stalin's predecessors said the same thing. When he was laying the foundations of his plan in the narrow circle of his comrades in arms, Stalin simply quoted Lenin and emphasized that it was Lenin's idea. But Lenin had not been original either. He in his turn scooped his ideas from the inexhaustible supply of ideas provided by Marx. There is an interesting letter written by Friedrich Engels on 12 June 1883 to Edouard Bernstein: 'All these layabouts of various kinds,' he wrote, 'must first of all fight like dogs among themselves, destroy and compromise each other, and in that way they will be preparing the ground for us.'

Stalin differed from both his predecessors and successors in that he spoke less than they, but acted more.

It would be very important to know, were it possible, what Stalin actually said in the Politburo meeting of 19 August 1939. Even although we cannot know the words he spoke, we see his actions and these show far more clearly what he had in mind. It was only four days after this meeting that the Molotov— Ribbentrop pact was signed in the Kremlin. The most outstanding achievement ever attained by Soviet diplomacy, it was Stalin's most brilliant victory in his extraordinary career. 'I have deceived him. I have deceived Hitler,' cried Stalin joyfully after the Pact had been signed. (Nikita Khrushchev, *Memoirs*, Chasidze Publications, 1981) Stalin had indeed deceived Hitler in a way that nobody had deceived anyone else throughout the whole of the twentieth century. Only a week and a half after the Pact had been signed Hitler had a war on two fronts. That is to say, from the very outset of hostilities Germany fell into a situation in which it could only lose the war; or, to put it

another way, on 23 August 1939, the day the Molotov-Ribbentrop pact was signed, Stalin had won the Second World War even before Hitler came into it.

It was only in the summer of 1940 that Hitler realized that he had been taken in. He tried to take on Stalin again, but it was too late. Hitler could hope for brilliant tactical victories only, but Germany's strategic position was catastrophic. Germany again found itself between two millstones. On the one side there was Britain on her inaccessible island, with the United States behind her. On the other side was Stalin. Hitler turned his face to the west, realizing that Stalin was quite clearly preparing an attack and that he could cut Germany's oil artery in Romania at one blow, paralysing the whole of German industry, and the entire German Army, Air Force and Navy. Turning his face to the east, Hitler first got strategic air raids and then invasion from the west.

It is said that Stalin won only thanks to the help and cooperation given by Britain and the United States, and herein lay his greatness; while being the West's most virulent enemy, Stalin knew how to use it in order to protect and reinforce his own dictatorship. Stalin's genius, as we've seen, lay in knowing how to divide his adversaries and then knock their heads together. Even in 1939, the free press in the West was already sounding a warning about such a course of events, when Stalin was playing a game of neutrality in words whilst, in deed, playing a very much more dangerous one.

CHAPTER 7

'Extending the Foundations of War'

*The national liberation of Germany lies in
the proletarian revolution seizing Central and Western
Europe, and uniting it with Eastern Europe in
the form of the Soviet United States.*

TROTSKY (BO, No. 24, p. 9)

After Napoleon had been expelled from Russia, the victorious Russian Army entered Paris. Not finding Napoleon there, the Russian Army went home, singing songs on its way. For Russia the aim of the war had been to rout the armies of the enemy. If no one else was threatening Moscow, then the Russian Army had nothing further to do in Western Europe.

The difference between Tsarist Russia and the Soviet Union lies in their respective war aims. In 1923 Mikhail Tukhachevsky, who had already gained renown for his monstrous brutality in mass exterminations in central Russia, northern Caucasus, the Urals, Siberia and Poland, was formulating the theoretical basis for the aim of war. According to Tukhachevsky, the aim of war was 'to guarantee for oneself the free use of violence and for this purpose it is necessary in the first instance to wipe out the forces of the enemy'. (*Revolyutsia i voina*, Moscow 1923, *Collected Works* No. 22, p. 188) The rout of the enemy armies and their general destruction do not mark the end of war and coercion, but only the creation of conditions for 'the free use of violence'. 'Every territory occupied by us becomes Soviet territory after its occupation, where the power of the workers and peasants will be established.' (Marshal of the Soviet Union M. Tukhachev-sky, *Izbrannye Proizvedeniya*, Moscow Voenizdat 1964, Vol. I, p. 258)

In his work, *Questions of Modern Strategy*, Tukhachevsky draws attention to the fact that Soviet military staff must give timely instructions to the political administration and other appropriate agencies to prepare revolutionary committees and other local administrative machinery for these or other regions'. (*op. cit.*, p. 196) In other words, Soviet military staff were to prepare 'liberation' operations in great secrecy, but while they

were doing this they were also to alert the political commissars and the 'appropriate agencies' that they should prepare in good time the communist administrative machinery for the 'liberated' regions. The Red Army would bring freedom to its neighbours on its bayonets, along with ready-made organs of local authority.

To this process of Sovietizing all seized territories as rapidly as possible by methods of unrestrained coercion and terror, together with the barbaric exploitation of all resources needed to continue aggression, Tukhachevsky gave a 'scientific' name: he called it 'extension of the basis of war'. Tukhachevsky even inserted this term into the Great Soviet Encyclopedia. (*Bol'shaya Sovetskaya Entsiklopediya*, Moscow 1928, Vol. 12, pp. 276-277)

In a speech on 30 March 1941, Adolf Hitler proclaimed to his generals what the objective of the war in the East was to be. It was to defeat the enemy armed forces, to wipe out the communist dictatorship, to establish 'real socialism' and to make out of Russia a base for continuing the war. Were Tukhachevsky's aims any different? Was he not promulgating the same ideas in 1923?

When he was preparing a military operation, Hitler took care to set up administrative machinery for new territories even before they had been invaded; Tukhachevsky too proposed to do exactly the same thing.

Tukhachevsky would have made a good *Gauleiter*, but he was no strategist. A scrutiny of his 'battering-ram' strategy reveals its complete lack of substance. It is the method adopted by a chessplayer who concentrates his attention on destroying all his opponent's pieces *en masse*, beginning with the pawns. Carried away by his theory, Tukhachevsky quickly and inevitably found himself without reserves in any serious clash. His defeat on the Vistula certainly did not happen by chance. All his life he tried, with dim-witted obstinacy, to improve his method, fallacious in principle, by using a theoretical base to shore up his ignorance. Communist historians assure us that, once he had liquidated Tukhachevsky, Stalin completely rejected his methods. This was not the case. Stalin only spurned Tukhachevsky's unacceptable strategic method, which was known to lead to defeat, but he retained his ideas about 'the extension of the basis of war' and allowed others to develop them further.

Apart from Tukhachevsky and others like him, Stalin did have real strategists. The first and most brilliant of these was undoubtedly Vladimir Triandafillov, the father of operational art.⁶ It was in 1926 that, in a book entitled *Range of Operations in Modern Armies*, he expounded the first approximate formulation of the 'operations in depth' theory. Triandafillov developed his ideas further in a subsequent book entitled *Character of Operations in Modern Armies*. Even today these books remain the foundation of the Soviet art of war. Triandafillov found people who understood his strategic ideas, which were truly ones of genius, and promoted them to the General Staff. Among these was A. M. Vasilevsky, the future marshal of the Soviet Union. G. K. Zhukov put Triandafillov's ideas into practice in all his operations, beginning with Khalkhin-Gol.

Triandafillov understandably could not easily relate to Tukhachevsky, even although Tukhachevsky was his immediate superior. Triandafillov was not afraid of Tukhachevsky and he exposed the poverty of the 'battering-ram' strategy by showing that a good chessplayer must not devote all his attention to destroying pawns. The good chessplayer delivers a blow 'in depth', thereby rendering his opponent's pawns useless. A good chessplayer will create a threat not in one but in at least two sectors, thereby compelling his opponent to divide his attention and reserves, while the player himself strikes a blow at another sector, where his opponent has no reserves at all.

When he rejected Tukhachevsky's military method, Triandafillov fully accepted and developed his theory on forcible and rapid Sovietization of 'liberated' territories; 'the Sovietization of entire states must be dealt with within a short period of two to three weeks. Where larger countries are concerned, Sovietization of very large areas must be managed in three to four weeks . . . When organizing revolutionary committees, it will be very difficult to count on local forces. Only a part of the technical apparatus and only the more junior executive officials will be available on the spot. All executive officials and even some of the technical personnel will have to be brought in along with the Army . . . The number of such officials needed to carry on Sovietization in recaptured areas will be enormous.' (*Kharakter Operatsii Sovremennykh Armii*, V. K. Triandafillov, Moscow 1929, pp. 177-8)

Triandafillov drew attention to the fact that it would be mistaken to divert Red Army fighting units to tasks of 'Sovietization'. It would be no bad thing to have special units for this. The Red Army does battle with the

⁶ Until the early twentieth century, all military art was divided into two levels: strategy and tactics. Soviet military thinking then developed an intermediate level and called it 'operational art'. Half a century later, Western military thinkers now accept this term.

enemy and inflicts defeat upon him, while these special units go to work in the rear establishing power, and a happy life for the workers and peasants. Hitler latterly took the same viewpoint. The Wehrmacht would crush the enemy, while the S S would set up the New Order. Of course, in critical situations — and war consists of these — the Wehrmacht divisions were thrown into the battle to suppress the partisan movement, while the SS divisions were thrown into tank battles on the forward edge of the battle area. That, however, was not what either the Wehrmacht or the SS was built for.

Triandafilov understood the art of war in terms of the exact sciences, in which by means of mathematical calculation he worked out simple formulae for offensive operations involving armies of millions operating in great depth. The formulae covered every stage of an offensive. They even included a calculation as to how many Soviet political leaders would be needed for every administrative unit in captured territories. They are formulae as sharp and elegant as any geometric theorem.

The Molotov-Ribbentrop Pact opened the gates to Sovietization. Stalin had everything ready and not only in theory. Soviet staff had worked out operations in great secrecy, but they did not neglect to give instructions to the political commissars and the 'appropriate organs' that they be fully prepared for Sovietization.

On the night of 16-17 September 1939 I. A. Bogdanov, a brigade commander in the NKVD, issued an order to the Chekists in which he said that 'at dawn on 17 September 1939, the armies of the Byelorussian Front will go over to the offensive. Their task will be to help the workers and peasants of Byelorussia who have risen in rebellion.' Thus the revolution in Poland had begun; the workers and peasants would be up to dealing with it themselves, while the Red Army and the NKVD would only render them assistance. The results are well known. The massacre of Polish officers at Katyn also comes into this category of assistance'.

Stalin was not afraid of Hitler, as the communists try to make it appear. If Stalin had feared Hitler, he would have kept the Polish officers safe and, when the German invasion took place, thrown them into battle at the head of tens of thousands of troops to fight as partisans on Polish soil. Defence against Hitler, however, did not enter into Stalin's plans. Stalin not only did not use this Polish potential, he even dissolved his own partisan detachments which had been formed earlier to be used in the event of war.

The Sovietization of Finland was prepared in even greater detail. At the very moment when 'the Finnish militarists began their armed provocations', Stalin already had up his sleeve a Finnish communist 'president', a 'prime minister' and an entire 'government', including a leading Chekist, for a 'free democratic Finland'. 'People's representatives' also turned up in Estonia, Lithuania, Latvia, Bessarabia and in Bukovina, all demanding that these countries be annexed to the 'fraternal family of nations'. Chairmen of revolutionary committees, people's jurors, deputies and many more were all found with surprising speed.

Sovietization thus gathered strength, while Stalin added to his reserves of Party administrators for new campaigns. On 13 March 1940, the Politburo took a decision to entrust the People's Commissariat for Defence with the practical task of grading the entire *nomenklatura*, or governing establishment of the Party, and of giving them military ranks. The entire Party changed from being semi-military into a purely military one. 'Officials of Party committees,' it was decided, 'would be obliged systematically to undergo military retraining so that, whenever they might be called into the RKKA [*Rabache-Krest' yanskaya Krasnaya Armiya* - the Workers' and Peasants' Red Army] or the RKKF [*Rabache-Krest'yanskii Krasny Plot* - the Workers' and Peasants' Red Navy], they would be able to devote themselves to duties appropriate to their qualifications.' (Politburo Decree, dated 13 March 1940, 'Military Retraining and Regrading of Party Committee Officials and the Procedure to be Followed on their Mobilization into the RKKA') The words, 'devote themselves to duties appropriate to their qualifications', are of particular interest. What qualification does a big shot in the Party have, apart from being qualified to act as secretary of a Party regional committee? Yet here we had plans being made to use them as secretaries of regional committees (and town committees and district committees), even after they had been called up to the Army.

From May 1940 until February 1941, 99,000 political workers in the reserve, who included '63,000 senior workers of Party committees', were regraded, that is they had to sit examinations and appear before boards. The retraining of the Party establishment went ahead at an intensified pace. And retraining was not all. On 17 June 1941 another decree was issued. Yet another 3,700 of the Party *nomenklatura* received orders to place themselves at the Army's disposal. Were preparations under way for a new Sovietization?

Not only did the Party bosses Sovietize the Baltic states, the western Ukraine, western Byelorussia, Bessarabia and Bukovina, but they also had a hand in the 'appropriate organs'. Working behind the backs of the 'people's representatives' and the 'servants of the people', the NKVD assisted the workers and peasants, who had risen in rebellion 'to reinforce the power of the proletariat', as it is put in Soviet propaganda parlance.

The frontier guards of the NKVD were the first to cross the borders. 'Operating in small groups, they seized and held river crossings and road junctions.' (*VIZH** 1970, No. 7, p. 85) In the 1939-40 Winter War against Finland, a detachment of NKVD frontier guards infiltrated secretly into Finnish territory, made a dash through the tundra and, in a surprise attack, seized the town of Petsamo and its harbour. In the war with Japan some five years later, using frontier guards, '320 assault detachments were formed, each consisting of between 30 and 75 men armed with machine guns, sub-machine guns, rifles and grenades. Separate detachments had a strength of between 100 and 150 men . . . The training which was carried out was based upon previously worked out and precisely defined plans of surprise attack . . . The surprise element in the operations was to play a paramount role in the attainment of success.' (*VIZH*⁷ 1965, No. 8, p. 12)

The NKVD frontier troops operated in exactly the same way in the war with Germany. In those places where German troops had not crossed the border, Soviet frontier troops went over it on their own initiative. They had been prepared. An example of this method of operating occurred on 26 June 1941. Soviet frontier motor-launches made a landing in the area of the town of Kiliya on the Romanian frontier. The landing established a bridgehead, on which the members of the assault landing-force gave fire support to the members of the NKVD reconnaissance patrol who had preceded them with a landing on the bank. (*Chasovye Sovetskikh granits*, Moscow 1983; p. 141) Interestingly ; at the time of the *German attack* these elite and highly trained NKVD troops, stationed on bridges at the frontier, had made no preparations either to repel an attack or defend the bridges. They yielded them to the enemy almost without a fight. When they had to capture the western part of a frontier bridge, however, these frontier troops revealed excellent training, and displayed both courage and bravery, all in the spirit of the Romanian assault described above. When they had to defend the eastern part of the bridge, these same soldiers showed a total *lack* of preparedness. It was simply that no one had trained them to do this. No one had ever put them through any defensive exercises.

⁷ An official military-historical magazine from the Ministry of Defence.

In 1940, the volume of NKVD operations exceeded that of 1944 and 1945, and of many subsequent years. 1940 was, of course, the year of Katyn. Polish officers were also exterminated in at least two other places, where the victims were no fewer than in Katyn. Lithuanian officers were exterminated at the same time, as were Latvian and Estonian officers; and not only officers. There were teachers, priests, policemen, writers, lawyers, journalists, peasants, entrepreneurs and people from all strata of society, exactly as in the Red Terror against the Russian people. The scale of the NKVD operations grew; but suddenly something changed. From February 1941, the NKVD's military sub-units covertly began a secret build-up near the state frontiers.

The chief strength of the NKVD, however, did not lie in its frontier troops. Apart from them, the NKVD consisted of a great number of regiments and divisions of operational, convoy and security troops. All of these worked very hard at destroying 'hostile elements' and at 'purging the territory'. In the Soviet -Finnish war of 1939-40, there were eight NKVD regiments engaged in this activity, as well as individual battalions, companies and formations of frontier troops. An operation carried out in 1944 in the rear of the Byelorussian Front may serve to illustrate the scale of these 'purges' of the area behind the front. Five NKVD frontier regiments, seven NKVD regiments of operational troops, four cavalry regiments, detached battalions and reconnaissance aircraft all took part in the operation. The total strength involved was 50,000 troops. The area covered was 30,000 square kilometres. (*Ibid*,p. 181) The NKVD operated on no less a scale even before Hitler attacked, though information on operations carried out in 1940 in the Baltic states, the western Ukraine, Byelorussia, Bukovina and Bessarabia has never been published.

Communist professors are now doing their best to play down the Red Army's power at the outset of World War II, and to overstate the strength of the Wehrmacht. This is done by manipulating statistics; while they take into account all divisions of the Wehrmacht and the SS in Germany, in the Soviet Union only the divisions of the Red Army are counted. The elite, highly trained, fully equipped and armed NKVD divisions, however, are conveniently left out of the calculation. The communists have proclaimed that 47 ground and six naval

frontier detachments, each with a complement of about one regiment, and n regiments of NKVD operational troops, totalling about 100,000 men, were stationed close to the frontiers. This is the truth. But not all the truth. When the Germans invaded, not only NKVD regiments, but separate NKVD battalions of impressive strength, as well as entire NKVD divisions, were stationed directly on the frontiers. For example, the 4th NKVD Division, commanded by Colonel F. M. Mazharin, was on the Romanian frontier, while sub-units of the 57th NKVD Regiment of this division were stationed directly at frontier bridges. The 8th NKVD Motor Rifle Division was close to the frontier. The 10th NKVD Division was in the Rava-Russkaya region, while the 16th NKVD Cavalry Regiment, which formed part of this division, was directly dispersed among posts along the frontier. The 21st NKVD Motor Rifle Division was on the Finnish frontier. The 1st NKVD Division, commanded by Colonel S. I. Donskov, was there as well. The 22nd NKVD Motor Rifle Division first appears in German operational summaries on the seventh day of the invasion of Lithuania.

Some of these NKVD units were incredibly close to the borders; sometimes literally only a few metres away from the frontier itself. For example, the 132nd NKVD Independent Battalion was in the Tiraspol fortification of the Brest-Litovsk fortress, though not for defensive purposes; the fortress had not been prepared for war. It had been intended, in the event of war, to leave only one infantry battalion there with ordinary troops. Sitting alongside, in the same barracks, for defensive purposes was the Fifth Frontier Detachment (a regiment); the 132nd NKVD Battalion was not in fact a frontier battalion at all, but a *convoy* battalion. This had been used to deport 'enemies' from western Byelorussia and here it was now stationed on the western bank of the river Bug. The battalion was doing nothing for the time being. It was a long, hard road back to the Soviet Union. First the river Bug had to be crossed to the old citadel in the boats of the Chekist officials. Then there was a multitude of gates to pass through, and minor bridges and ditches to cross. Next came the river Mukhavets, but once over that, there were even more ditches, banks and barriers. There were no enemies in the fortress and it was therefore a long way to town, so the battalion was resting - for the time being. In the other direction was the Tiraspol fortification, a fortress island on Polish territory, or rather, to be more exact, on German, as it was no longer part of Poland. And all the battalion had to do to reach German territory was to cross a small bridge.

On a wall in the barracks of the 132nd Independent Battalion someone wrote an inscription: 'I am dying, but I shall not surrender. Farewell, Motherland! 20. VII. 1941.' These 'heroes' had good reason not to

surrender. The SS would have already worked out who the Cheka officials intended to deport from the other side of the state frontier.

I found, as we have seen, NKVD convoy battalions and regiments, and indeed convoy divisions, right on the frontier. The 4th NKVD Division straddled the frontier bridges across the river Prut. Was it there perhaps to blow them up, should the situation become exacerbated? By no means. The bridges were mined. Afterwards the mines were removed and an NKVD division was placed alongside the same bridges. According to one piece of information, the 4th NKVD Division was a kind of security division: by making an analogy with the SS, the meaning of the word 'security' becomes altogether more sinister in this context. Other information, however, indicates that the 4th NKVD Division operated like a convoy division. Indeed Colonel Mazharin, who commanded the division, was an old GULAG wolf, who spent all his career in convoy work. But whom did the Gulag security intend to escort across the frontier bridges?

CHAPTER 8

Why Howitzer Artillery for the Chekists?

We shall destroy the beast in his lair.

L. BERIA

(Commissar General for
State Security, People's
Commissar for Internal
Affairs, February 1941)

The communist punitive machine had two principal mechanisms, the organs and the troops. What is understood here by 'troops' is not, of course, Red Army troops, but special formations of the VChK (*Vserossiiskaya Chrezvychainaya Komissiya* -the All-Russian Special Commission, or Cheka), the OGPU (*Ob'edinennoe Gosudarstvennoe Politicheskoe Upravlenie*) and the NKVD.

While the Red Army fought on external fronts, these special divisions waged war on internal fronts. At the time when the communist dictatorship was being established, the punitive troops played an incomparably more important role than the punitive organs. Equipped with armoured cars, armoured trains, three-inch cannon and machine guns, they waged a real war against their own people.

In 1923, the Chief Directorate was set up to co-ordinate the operations carried out by all punitive troops. Although the punitive machine changed its name from time to time as easily as a snake changes its skin, the name of the Chief Directorate remained unchanged. This organization, and the troops under

its command, perpetrated fearful atrocities against the Russian and indeed all other nations who populate the Soviet Union. In the times of collectivization alone, the punitive troops exterminated millions of people, and handed over more than ten million of them to that other directorate of the NKVD, the GULAG, responsible for prisons and labour camps.

As the communist dictatorship grew in strength, the organs came to occupy an increasingly important place in relation to that held by the punitive troops. The informer's pen, the interrogator's thumbscrew and the executioner's Nagan revolver became the main weapons of terror. Of course, the numbers of the punitive troops did not grow any less, but their role became largely a secondary one, involving round-ups, searches, arrests, deportations, and the protection of punitive and 'correctional' establishments. The punitive troops also protected leaders, the national frontiers and communications. The image of the punitive fighter also changed. It was then no longer a sailor with the face of a criminal in an armoured car, but a soldier wearing a sheepskin coat, his face turned into the Arctic wind, rifle in hand and with his faithful dog at his side. The punitive soldiery no longer had armoured cars. They were no longer needed.

1937 was not, as the communists assure us, the beginning of the terror, but rather the year when it reached its peak. A year later, it had undergone a change in character, in that it had changed from being a general terror into a selective terror. It was during 1937 and 1938 that the terror even spread to the communist leaders themselves. By the time that stage had been reached, the Chekists no longer needed their machine guns. The communists, who had by then come under the blows of the axe of terror, did not offer any particular resistance.

After the Great Purge had been successfully concluded in December 1938, the terror within the country abated sharply; many prisoners were released by the GULAG, and preparations were made to release many more. In this situation, what was to happen to the troops of the NKVD and the Chief Directorate which co-ordinated their activities?

Any doubts as to whether they would in fact be abolished were quickly dispelled. The Soviet Union had embarked upon a new phase of its existence, for immediately after the Great Purge had ended and Nikolai Yezhov had been removed from power, the Chief Directorate controlling the NKVD frontier and interior troops ceased to exist under a decree issued on 2 February 1939 by the Council of People's Commissars.

On the same day, no fewer than six independent chief directorates were created inside the NKVD to take charge of the troops and deal with military matters. These were:

The Chief Directorate (GU) of NKVD
Frontier Troops

The Chief Directorate (GU) of NKVD
Security Troops
The Chief Directorate (GU) of NKVD
Convoy Troops
The Chief Directorate (GU) of NKVD
Railway Troops
The Chief Directorate (GU) of NKVD
Military Supply
The Chief Directorate (GU) of NKVD
Military Construction, given the
acronym of *Glavvoenstroï* of the NKVD.

The Soviet punitive machine then underwent a sharp change in character as the Government decided that the punitive troops should be given a position of primacy over the organs. The beginning of 1939 marked the start of a breathtaking increase in the punitive troops' power. Once again their armament included armoured trains, the latest BA-10 armoured cars, howitzers, and finally tanks and aircraft.

Punitive troops of all types and functions began to grow rapidly in numbers. The NKVD troops became so numerous that a special post had to be created to control them, and Lieutenant-General I. I. Maslennikov was appointed Deputy People's Commissar for Troops.

The strange thing, however, was that punitive troops were no longer needed on Soviet territory. There were clearly no plans for another purge in the Soviet Union in 1939, as the country had been brought to its knees and was by then totally subjected to Stalin.

The NKVD troops developed in many directions, one of which was the formation of their retreat-blocking service in 1939. The task of retreat-blocking detachments is to bolster the resolve of troops in battle, particularly an offensive battle. Having deployed behind the troops, the retreat-blocking detachment encourages the advancing soldiery with bursts of machine-gun fire directed at the backs of their heads, delays

the troops if they are retreating, returns the obedient soldiers to the battle and shoots the disobedient ones on the spot.

Such detachments had been used during the Civil War. Indeed, quite a few rascals who distinguished themselves in this field were cited in Soviet publications as 'heroes of the Civil War'. Here is a typical example: 'Vypov, I. P.—leader of a machine-gun team of the retreat-blocking detachment of the 38th Infantry Division' (*VIZH*, 1976, No. 12, p. 76) The retreat-blocking soldiers' life is not one of service, but a holiday. Enemy artillery does not worry them. They fight not against a stray enemy, but against their own demoralized men. Decorations shower upon them from the horn of plenty. Our hero has two Orders of the Red Banner.

As part of the secret build-up of Soviet forces in the country's western regions before the Molotov-Ribbentrop Pact was signed, a detached motorized infantry regiment of the NKVD became an integral part of each army. This regiment consisted not of battalions, but of retreat-blocking detachments.

Apart from the regiments which made up the armies, there were also detached NKVD motorized rifle regiments which formed part of the fronts. For example, in June 1941, there were nine regiments, an independent detachment and a detached battalion of the NKVD behind the Southern Front alone. (*VIZH*, 1983, No. 9)

In addition to NKVD motorized rifle regiments, independent retreat-blocking detachments of the NKVD were also created. These immediately became part of the corps and armies which were then being formed. One of these, for example, was the 241st Detached Retreat-Blocking Detachment, which became part of the 19th Army.

Major-General P. V. Sevast'yanov has stated that the NKVD's retreat-blocking service worked with great precision and sureness of touch. In order to perform their allotted service of stopping any retreat, the NKVD troops always took up position behind the fighting troops in every situation. 'Companies of frontier troops immediately deployed behind us' (*Volga-Neman-Dunai*, Moscow Voenizdat, 1961, p. 82) In General Sevast'yanov's words, his infantry were having to fight German troops without tanks, while the Chekists, who did have tanks, stood behind them.

We can find quite a few indications in Soviet sources which show that the NKVD's retreat-blocking service was active from the very first hours of the war, which means that it had been deployed even before the

Germans invaded. Their presence is acknowledged in Colonel-General Leonid Mikhailovich Sandalov's account of June 1941: 'I shall leave the Army retreat-blocking detachment here,' he writes. 'The Army retreat-blocking detachments were stopping them and sending them to the nearest units of the 28th Rifle Corps.' (*Perezhitoe*, Moscow, 1966)

That the NKVD's retreat-blocking service was revived before the German attack and indeed before the Molotov-Ribbentrop pact is direct evidence that the war had been decided upon in the Kremlin long before it actually began.

The NKVD expanded its operations in other directions as well. From the beginning of 1939, the strength of the NKVD frontier troops sharply increased. Since Lenin's time, the Soviet Union had had six frontier districts. Now their number increased to eighteen, while at the same time the military strength in each new district grew in relation to what it had been in the old districts. We have already had occasion to observe the aggressive tendencies of the Soviet frontier troops, which always served as the basis on which the OSNAZ (*Osobogo Naznacheniya* - special purpose) formations were set up.

In August 1939, before the Molotov-Ribbentrop Pact was signed, a rapid growth occurred in the number of NKVD OSNAZ troops. OSNAZ formations were the most aggressive strike formations in the Soviet punitive machine. In the Civil War OSNAZ units were notorious for their brutality, which was extreme even by Cheka standards. After the Civil War had ended, OSNAZ was sharply cut back so that only one NKVD OSNAZ division remained in the Moscow region. This division was under the command of NKVD Kombrig⁸ Pavel Artem'ev.

At the beginning of August 1939, G. K. Zhukov was preparing his surprise strike against the Japanese. A detached OSNAZ battalion of the NKVD numbering 502 men was placed at Zhukov's command. Although the battalion was small, it consisted of specially picked stranglers whose hands were more than accustomed to murder. The main task of this OSNAZ battalion was 'to purge that area of the rear which lay closest to the

⁸ Brigade-Commander - term used before 1940. *Kombrig* and similar terms were abandoned after 1940, and the English equivalent rankings were used.

front'. (*Chasovye Sovetskikh Granits*, IPL, Moscow 1983, p. 106) OSNAZ did its work splendidly and Zhukov was highly satisfied.

Immediately after this, the formation of OSNAZ battalions began on the Polish frontier. A dispatch from the political department of the frontier troops in the Kiev district, dated 17 September 1939, mentions that OSNAZ battalions had already been set up.

During the 'liberation' of Poland, Bessarabia, Bukovina, Estonia, Latvia, Lithuania, and Finland, the OSNAZ battalions were the first to cross the frontiers. Their task was first to knock out enemy frontier posts by surprise attack, and then, by operating ahead of the advancing troops, to capture bridges, cut communications, wipe out small groups of the enemy and terrorize the population. Once the Red Army units had caught up with the OSNAZ battalions, these then turned to the tasks of purging the territory and of exterminating undesirable elements. We can find mention of the NKVD's OSNAZ battalions in the same official history of the frontier troops. (Documents Nos. 185 and 193) Here are the fruits of their work: 'About 600 prisoners were escorted across the frontier; these included officers, landowners, priests, gendarmes and policemen . . .' (Document No. 196) In a contemporary version of this document this sentence comes to an abrupt halt at its semi-colon, and we are not told who were taken as 'prisoners'. A document dated 19 September 1939 describes the situation at one particular small NKVD frontier post. It was the third day of the 'liberation campaign' in Poland. This liberation is explained nowadays as a Soviet attempt to secure its borders against Hitler. Why then drive 'landowners and priests' across the frontier into the Soviet Union and declare them prisoners? These 600 prisoners formed only one drop in a very great stream which poured not simply through one frontier post, but through all of them, having begun its flow on the very first day of liberation'.

It was foreseen that, after the new frontier with Germany had been established, new usurpations would follow. Far from dissolving the previously created OSNAZ battalions of the NKVD, Stalin set up new battalions, and not only battalions. He created regiments, divisions, and even an NKVD OSNAZ corps under the command of NKVD Komdiv⁹ Shmyrev, Commissar Chumakov, and Chief of Staff NKVD Colonel

⁹ See previous page.

Vinogradov. References to this top secret corps may sometimes be found in official Soviet documents. (*Pogranichnye Voiska SSSR 1939-41*, Nauka, 1970, Document No. 39).

The movement of all types of NKVD troops towards the Soviet Union's western frontier in February 1941 cannot be explained as a defence against German invasion. Had it been so, then surely the formation of new punitive battalions, regiments and divisions should have been halted in favour of something more appropriate to defence, such as the formation of a corps of sappers to mine the entire western territory of the Soviet Union or cover it with anti-tank ditches and trenches.

But Stalin was not engaged in anything like this. Stalin needed punitive troops, not sappers. That is why one more military chief directorate was set up in the NKVD at the beginning of 1941. This time it was a purely military one, the Chief Directorate of Operational Troops of the NKVD. At its head, Stalin placed Pavel Artem'ev, an OSNAZ veteran who had commanded the 1st OSNAZ Division of the NKVD, and who had already risen to the rank of NKVD lieutenant-general.

The new chief directorate immediately set in motion a vast deployment of troops. The basic military unit was an NKVD motor-rifle division consisting of a tank regiment (or battalion), two or three motor-rifle regiments, a howitzer artillery battalion, and other sub-units. The total strength of each division was more than 10,000 Chekists.

The NKVD motor rifle divisions spread immediately to the western border of the Soviet Union. NKVD punitive divisions armed with tanks, howitzers and other heavy weapons were simply not needed on Soviet territory. Neither were they required in the territories which had recently been seized. Here the NKVD's terror machine got by without tanks, although in extreme cases they sought help from the Red Army.

The NKVD divisions were intended to be used in the rear in wartime, not in the front. That these divisions had heavy weapons indicates that it was planned to use these divisions against a strong enemy. But there was no strong enemy, nor could there be one, in the rear of the Red Army on Soviet territory.

A strong enemy could only appear in the rear of the Red Army in the event of the Red Army crossing the frontier and driving forward. Hitler did not allow this to happen. He struck the first blow, and thus rendered

all the NKVD's Soviet rifle divisions redundant. The NKVD's Chief Directorate of Operational Troops proved to be quite unnecessary in the defensive war which followed. Four days after the war had begun, Stalin moved NKVD General Artem'ev from the Chief Directorate of Operational Troops, leaving it without a leader. No more NKVD motor-rifle divisions were formed after 1941, and the existing divisions were re-formed as ordinary rifle divisions of the Red Army. The NKVD's 21 st Motor Rifle Division, for instance, under NKVD Colonel M. D. Panchenko, was changed into the 101st Rifle Division of the Red Army; the NKVD's 13th Motor Rifle Division became the 95th Rifle Division of the Workers' and Peasants' Red Army (and later the 75th Guards Division); and the NKVD's 8th Motor Rifle Division became the 63rd Rifle Division of the Workers' and Peasants' Red Army (later the 52nd Guards Division). In all, 29 divisions were transferred from the NKVD to the Red Army. (Major-General V. Nekrasov, *VIZH*, 1985, No. 9) In the defensive war that had been forced upon him, Stalin needed ordinary infantry, not punitive troops.

In 1944 the Red Army, with the NKVD in its wake, arrived in Central Europe and established workers' and peasants' power, social justice and other blessings. But even in 1939 Stalin was already setting up the machinery for establishing that happy life. Hitler simply prevented this machinery being used until 1944.

The Soviet terror machine was enormous and was intended not just for Eastern Europe but Europe in its entirety. It had to be sharply reduced in size after Hitler invaded because it no longer served any immediate purpose.

The creation of machinery with which to Sovietize Europe began before the Molotov-Ribbentrop Pact. The Pact was signed after a final decision had been taken to establish a happy life in Europe. The Pact was only a tactical move which would allow Europe to be brought down to the levels which had existed there in 1918, thereby opening the gates to the OSNAZ formations and the motor-rifle divisions of the NKVD.

CHAPTER 9

Why the Security Zone was Dismantled on the Eve of War

*Mines are a powerful thing, but this is a resource
for the weak, for those who are defending themselves.
We do not need mines as much as we need
the means of clearing them.*
Marshal of the Soviet Union
GRIGORY IVANOVICH KULIK,
early June 1941

A country which is preparing its defence deploys its army deep inside its own territory, and not on its very frontier. The object is to prevent the enemy from destroying the main defending forces with one surprise attack. A defending side will normally build a security zone in the frontier areas in plenty of time; a zone where the terrain has been saturated with traps, engineered defences, obstacles and minefields. The defending side will deliberately avoid constructing anything related to industry or transport in this zone; nor will it keep any heavy military formations or large quantities of supplies there. On the contrary, timely preparations will have been made to blow up all bridges, tunnels and roads in this zone.

Once inside the security zone, the aggressor loses speed of movement, and his troops sustain losses before they even encounter the main forces of the defender. Only small but highly mobile detachments of the defending side operate in the security zone. These detachments spring ambushes, launch surprise attacks and then quickly withdraw to previously prepared positions. Light detachments create the impression that they are the main force, compelling the aggressor to stop, deploy his forces and waste his shells on areas where there is nothing to hit. The light detachments, meanwhile, secretly withdraw to prepare new ambushes.

While the aggressor is waging an exhausting battle with the light detachments of the covering force, the main defending forces have time to prepare themselves to confront the aggressor from positions which favour defence.

The deeper the security zone is, the better. As he breaks into a deep security zone, an aggressor involuntarily reveals the main direction of his thrust, and loses the advantage of surprise. Since he does not know how deep the security zone is, he cannot predict when he will encounter the defender's main forces; thus, the initiative has passed to the defending forces.

Throughout the centuries, and indeed the millennia, Slavonic tribes have created powerful security zones of enormous length and vast depth. Among the many defence obstacles they employed, the most important and effective was the forest barrier. This consisted of a strip through the forest in which the trees were felled at a point in the trunk just higher than a man's height, in such a way that the felled part of the tree stayed attached to the stump. The tops of the trees were then piled in a criss-cross manner on the side from which the enemy was expected to approach, and were pressed to the ground with stakes. The thin branches were chopped off, and the thick ones sharpened. At those places where it was unlikely that the enemy would appear, the barrier was usually only a few dozen metres deep. But on the routes along which the enemy would probably approach, the depth of the forest barrier could amount to forty to sixty kilometres of impassable obstacles reinforced by palisades, stakes, concealed pits, terrible traps capable of breaking the legs of a horse, and snares of the most ingenious construction.

Forest barriers in Old Russia stretched for hundreds of kilometres; the Great Forest Barrier Line, constructed in the sixteenth century, was more than 1,500 kilometres long.

Fortresses and citadels were built behind these lines, which were carefully protected by light mobile detachments. As the enemy tried to penetrate the barrier, these detachments would launch surprise attacks before withdrawing along secret passages. Every attempt to pursue them ended badly for the enemy. False passages were made through the barriers, and these led the enemy into a zone of traps and ambushes.

It is interesting to note that, when the frontiers of Tsarist Russia moved southwards, the old barriers were not destroyed, but were fully preserved and fortified, while a new line of fortifications, fortresses, and fortified towns was constructed, and in front of them a new forest barrier was built. By the end of the seventeenth century, any enemy who tried to attack Moscow from the south would have had to overcome eight of these forest barriers, which had been made to a total depth of 800 kilometres. This was beyond the capability of any one army to penetrate. But even if anyone had decided to try to overcome all these barriers, he would never have been able to make a surprise attack. The aggressor would have been worn down by enormous effort and

by constant raids effected by light mobile detachments. Even supposing that he overcame all this, he would find the Russian Army, fully mobilized, fresh and ready for battle, awaiting him at the end of the road.

Security zones still retain their importance in the twentieth century. The Red Army understood full well what a security zone was, having had enormous experience of operating in them. During the 1920 campaign to 'liberate' Warsaw and Berlin, the Red Army found itself in a security zone prepared by the Polish Army. Chief Marshal of Artillery N. N. Voronov noted how

the Polish troops destroyed everything in the wake of their withdrawal, railway stations, railway lines, and bridges. They burned villages, crops, and haystacks. We moved forward with great difficulty. We had to ford every small river by wading or by improvised means. Having to carry our ammunition made our progress even more difficult. (*Na Sluzhbe Voennoi*, Voenizdat 1963, p. 34)

After such an experience, the Red Army itself created strong security zones on its own frontiers, particularly its western borders. Special government commissions inspected the country's western regions and determined which zones an enemy would find easiest to cross, and which would afford him most difficulty. Teams of bridge-protection guards, trained in demolition work, were made ready to blow up all the bridges in the western regions. The 60-metre long railway bridge at Olev, for example, could have been blown up by the duplicated explosion system in two and a half minutes. (I. Starinov, *Miny Zhdut Svoego Chasa*, Moscow Voenizdat 1964, p. 24)

Heavy pipe-lines, depots, water pumps, water towers, high embankments and deep cuttings were all prepared to be blown up. (*Ibid*, p. 18) By the end of 1929, 60 teams of demolition sappers, totalling 1,400 men, had been trained in the Kiev Military District alone. These had at their disposal '1,640 fully prepared sophisticated charges and tens of thousands of safety-fuse detonator sets, which were ready literally for instant use.' (*Ibid*, p. 22) Similar activity was also going on in other military districts.

In addition to the teams of demolition sappers which had been set up in the western regions of the country, railway-blocking battalions were formed. One of their tasks was to destroy the main railway junctions in the

event of a retreat and to create defence obstacles on the main arterial routes by destroying roads and laying delayed-action land mines lest the enemy should try to rebuild the roads. There were four such battalions in the Ukraine in 1932. (*Ibid*, p. 175)

Railway points crossings, communications equipment, telegraph wires and in some cases even the rails were got ready to be removed. (M. Tukhachevsky, *Izbrannye Proizvedeniya*, Moscow Voenizdat 1964, Vol. i pp. 65-67)

The Soviet security zone underwent continuous improvements. The number of targets prepared for demolition steadily grew. New defence obstacles were created: forest barriers; artificial reservoirs in front of defensive constructions; preparations were even made to flood some areas.

In the autumn of 1939, the Soviet Union had a great stroke of luck. Under the Molotov-Ribbentrop Pact, it annexed new territories between 200 and 300 kilometres deep. The security zone that had already been set up thus grew considerably in depth. Nature herself could have created these new territories for the express purpose of equipping it as a security zone. They had forests, hills, bogs, deep rivers with marshy banks and, in the western Ukraine, fast-flowing mountain rivers between steep banks. In short 'the terrain favoured defence and the creation of defence obstacles.' (Marshal of the Soviet Union A. Eremenko, *V Nachale Voiny*, Moscow Nauka 1964, p. 71) As if that were not enough, the network of roads was still at a primitive stage of development. Of 6,696 miles of railway lines, only 2,008 had double tracks, but the capacity of even these was limited. It would have been quite easy, were the need to arise, to make these railway lines quite unusable.

It was at this point that the Red Army had spectacular confirmation of the value of security zones to a defending side. In the autumn of that year, the Soviet Union invaded Finland. The attack was no surprise, however, for the Finnish forces were far from the frontier behind their own security zone when it arrived.

The failures of the Red Army on this occasion were not simply the results of miscalculations by the Soviet command. More important was the fact that the Finnish Army was prepared for defence, and ready to make sacrifices. The Finns had erected their security zone in front of their main line of defence. This zone -some 40-60 kilometres deep (*Sovetskaya Voennaya Entsiklopediya*, Vol. 6, p. 504) - was strewn with minefields and defence obstacles. Snipers, sappers and light mobile detachments were extremely active.

The result was that it took the Red Army 25 days to overcome the security zone. They emerged from it facing the main line of defence having suffered great losses, with low morale and without ammunition, fuel or supplies. Space for manoeuvre was severely restricted. One step off the road might be the last one would ever take. The rear units fell behind and found themselves under constant threat of repeated raids by Finnish light detachments, who knew the locality extremely well and who had secret paths through the minefields.

All the Soviet commanders who fought there expressed their admiration of the Finnish security zone. Foremost among them was K. Meretskov, who commanded the 4th Army. (*Na Sluzhbe Narodu*, Moscow IPL 1968, p. 184) After he had finally overcome the Finnish security zone and had assessed its worth, Meretskov was appointed Chief of the General Staff. So how did he make use of his experience in order to reinforce the Soviet security zone which had been set up along the Soviet Union's western frontiers?

Meretskov ordered that:

1. The security zone which had previously been constructed along the Soviet Union's western frontiers should be dismantled, the teams of demolition sappers disbanded, the explosive charges removed, the mines rendered harmless, and the defence obstacles razed to the ground;
2. No security zone should be set up in the new lands;
3. The main forces of the Red Army should be moved right up to the frontiers, without a security zone to protect them;
4. The strategic resources of the Red Army should be brought from the heart of the country and concentrated directly on the frontier;
5. A vast works programme should begin at once to build a network of roads and airfields in western Byelorussia and in the western Ukraine: single-lane roads were to be made into dual-lane roads, the capacity of the roads was to be increased; and new roads leading directly to the German border were to be built.

The results of this ludicrous policy became clear when Poland was partitioned in 1939. Bridges across what were now frontier rivers remained intact, even though nobody used them. There were six such bridges in the zone of the Soviet 4th Army alone. For understandable reasons, the Germans never raised the issue of destroying them, although no one needed them in peacetime. But the Soviet leaders did not raise the issue of destroying them either. The moment the war began, all these bridges were captured by the Germans, allowing a great number of German troops to cross them and catch the Soviet 4th Army napping. This army suffered a crushing defeat, opening the way into the rear of the powerful 10th Army, which suffered a quite unprecedented rout as a result. Encountering no further obstacles in his path, Guderian began his drive for Minsk.

'Why, in particular, were so many bridges across the Bug left intact in the 4th Army zone?' enquires L. Sandalov, former chief of staff of the 4th Army. (*Perezhitoe*, Voenizdat 1966, p. 99) Why indeed? The German command hoped to use the bridges in an aggressive war, so it was clearly not in their interests to destroy them. But what was the Soviet Command hoping for?

The decision to leave the bridges intact is usually explained as a piece of incompetence on the part of the Soviet commanders. But it was Sandalov, whose most striking quality was his exceptional prudence and attention to detail, who was responsible for these bridges. It is interesting that no one has blamed him for doing nothing about these bridges, nor has anyone put him up against a wall for it. On the contrary, in June 1941 he began his rapid rise in rank from colonel to colonel-general, and distinguished himself in many operations.

The German troops advanced further without encountering difficulties, capturing bridges across the Dvina, the Berezin, the Niemen, the Pripyat' and even the Dnieper. A failure to prepare these bridges for demolition could be judged as criminal negligence. But the matter is more serious. They had been prepared for demolition, but were cleared of mines after the common Soviet—German frontier had been established. The mines were cleared everywhere. This means that it happened not because of a whim of individual idiots, but because it was state *policy*. 'Our country,' wrote Colonel Ilya Starinov, 'was now directly adjoined to the West, which contained the powerful military machine of Nazi Germany.'

The threat of invasion hung over England . . . When I learnt that preparations were being made to dismantle the defence obstacles in the frontier zone, I was simply stunned. Even everything which we had succeeded in setting up in the years 1926-33 was in fact eliminated. There were no longer any stores with already prepared charges sited near important bridges and other objectives. It was not only that there were no brigades. There were no special battalions either . . . The Ul'yanovsk School of Special Engineering, which was the only training institution which turned out highly qualified commanders for sub-units equipped with radio-controlled mines, was made into a communications school. (I. Starinov, *op. cit.* p. 175)

The element of surprise - so advantageous to the Germans in June 1941 - could have been reduced had the main Soviet forces been kept away from the actual frontiers. Empty territory, even without any technical defence installations, would have served as a security zone after its own fashion, by allowing the main forces time to get ready for action. But, according to the official Soviet account,

The armies . . . were to deploy directly along the state frontier ... in spite of the fact that its geographical outline was entirely disadvantageous to defence. Even those security /ones stipulated in our pre-war directives had not been technically prepared, (*htoriya Velikoi Otechestvennoi Voiny*, Voenizdat 1961, Vol. 2, p. 49)

Thus Meretskov was acting against Soviet military interests. So why did Stalin not dismiss him? He did; but not because Meretskov had eliminated the security zone and failed to create a new one, but because Meretskov had not been active enough in building roads, bridges, and airfields in the new regions.

On 1 February 1941, Meretskov's place as Chief of General Staff was taken by General G. K. Zhukov. The work then intensified on a truly Zhukovian scale. Prior to this, there had been five railway brigades in the Red Army. Zhukov immediately increased this number to thirteen. Each brigade consisted of one regiment, two detached battalions and back-up sub-units. Almost all the railway troops were concentrated in the western frontier regions, where they worked intensively at modernizing old railway tracks and laying new ones leading

right up to the frontier itself. (*Red Star*, 15 September 1984) The construction of these lines suggests that the Soviet leadership was looking upon the frontier zone not as a battle zone but as its *rear area* to which, in the event of a rapid advance into the west, it would be essential to send millions of new reservists, millions of tons of ammunition, fuel and other items of supply.

The construction of railways was accompanied by the building of motor highways running directly to the frontier towns of Peremyshl', Brest-Litovsk and Yavarov. When preparations are being made for a defensive war, 'belt' roads are built running parallel with the front, so that troops may be moved from passive sectors to those under threat. These 'belt' roads are built deep in the rear; the frontier regions themselves are left as far as possible without roads or bridges. But the Red Army built both railways and motor highways running from east to west, directly to the front. This is done when preparations are being made to advance, so that reserves can be transferred rapidly from within the country to the state frontier, and so that the troops can subsequently be supplied when they have crossed the frontier.

'The network of motor highways in western Byelorussia and the western Ukraine,' recalls Marshal Zhukov, 'was in a very bad condition. Many bridges were unable to bear the weight of medium tanks or artillery.' (*Vospominaniya i Razmyshleniya*, p. 207) The situation should have delighted Zhukov: the supports of these rickety bridges could have been knocked down; anti-tank mines could have been laid on the banks, snipers posted in the undergrowth, and anti-tank guns put in place. Instead, Zhukov was furiously building roads, and replacing old bridges with new ones, so that tanks and artillery could use them.

The NK VD and Lavrenty Pavlovich Beria in person gave the Red Army enormous help in this mighty work. The term 'the construction organizations of the NK VD' is often encountered in Soviet sources. (Air Chief Marshal A. A. Novikov, *V Nebe Leningrada*, Nauka 1970, p. 65) But we now know whom the NKVD used as manpower. Why else were so many labour-camp prisoners held in the frontier zone, particularly on the eve of the war?

Meanwhile war was clearly approaching. The official *History of the Kiev Military District* (Voenizdat 1972, p. 147) states that 'at the beginning of 1941 the Nazis set about building bridges, railway branch lines and field aerodromes'. These were clear signs that an invasion was being prepared. Yet this is what the Soviet railway troops were doing at exactly the same time. (*Ibid*, P. 143)

The railway brigades which Zhukov had set up accomplished a vast amount of work on Soviet territory. Their main purpose, however, was to operate on enemy territory in the wake of the advancing troops by rapidly overcoming the enemy's security zone, by rebuilding roads and bridges and by altering the narrow Western European gauge on the main railway lines to make it correspond to the broader Soviet standard. After the war began, these brigades were used to put up defence obstacles, but this was not what they had been brought into existence to do.

On the eve of the war, the Soviet railway troops did not prepare the rails for removal or demolition. They did not transport their supplies away from the frontier zones. On the contrary, they stockpiled rails, collapsible bridges, building material and coal in considerable quantities directly on the frontier. It was right there that the German Army captured all these stocks. German documents give evidence of this, as indeed do Soviet sources. Starinov, who was head of the Department for Defence Obstacles and Mining in the Engineering Directorate of the Workers' and Peasants' Red Army, described the Brest-Litovsk frontier railway station on 21 June 1941. 'Near the railway tracks,' he wrote, 'the sun shone down upon mountains of coal and heaps of brand-new rails beside the tracks. The rails sparkled in the sunshine. Everything breathed tranquillity.' (*Miny Zhdut Svoego Chasa*, p. 190)

Everyone knows that rails very quickly become covered with a thin coating of rust. The point here is that the rails had just been delivered straight to the frontier on the day before the war began. Why?

'Ah, if only Stalin had not eliminated Tukhachevsky, everything would have been different,' was the thought which was constantly hammered into our heads. Tukhachevsky had distinguished himself by his brutality in the shootings of both the peasants in Tambov Province and also of the Kronstad sailors who had been taken prisoner; faced with a real war, he had been defeated by the Polish Army. In all remaining respects he was no different from any other Soviet marshal. 'When preparing an operation,' he wrote, 'it is absolutely essential to make a stockpile of wooden bridges, and to concentrate railway reconstruction units in the necessary sectors . . . when the narrow gauge is being adjusted to a wide one.' (Marshal M. Tukhachevsky, *Izbrannye Proizvedeniya*, Voenizdat 1964, Vol. I, pp. 62-63)

Practically all the Soviet engineering and railway troops were gathered on the western frontiers. Sapper units and units belonging to those divisions, corps and armies which were concentrated on the frontier itself,

as well as other units from other formations which had begun to move up to the border, were all operating in the frontier zone before the war began. The Soviet sappers were busy

preparing the departure positions from which the offensive would begin; laying down roads for columns to move along; surmounting and erecting engineered defences, creating tactical and strategic camouflage, ensuring that the infantry and tanks which formed part of the assault groups interacted properly; protecting forced river crossings . . . (*Sovietskie Vooruzhennye Sily*, Voenizdat 1978, p. 255)

Let not the words 'erecting engineered defences' mislead the reader. By the time that the decisive attack on the Finnish Mannerheim Line began, Soviet sappers had also built several sectors consisting of engineered defence obstacles similar to the Finnish ones. Before going into battle, the newly arrived Soviet troops were put through these defences, which had been put there for training purposes. After that, they went over to the real attack.

With all due respect to the German Army, it must be admitted that it was catastrophically unprepared for a serious war. The impression is given that the German General Staff simply did not know that winter occurs on occasions in Russia, or that the roads were somewhat different from German ones. The oil used to lubricate German weapons congealed in the intense cold, and consequently they did not work. The German *Blitzkrieg* was unable to move with the same rapidity over Russian roads as it had over French ones. Hitler knew that he had to make war in Russia; if German industry was producing arms which were only suitable for use in Western Europe and Africa, who can say that Germany was ready for war with the USSR?

Hitler was lucky, however: Zhukov, Meretskov and Beria had obligingly compensated for the defects in German military planning by building roads and laying down great stockpiles of rails, collapsible bridges and building materials just where the enemy could capture them. What would have happened to Hitler's army had a powerful programme of self-defence been put into effect, with bridges blown up, rolling stock and rails

evacuated, all stores destroyed and the roads wrecked, flooded, turned into marshes and mined? The German *Blitzkrieg* would have skidded to a halt long before it reached Moscow.

It was not, of course, for Hitler's benefit that Meretskov, Zhukov and Beria had built roads and railways and stockpiled supplies. It was to let the Soviet 'liberation' army loose on Europe, with speed and with nothing in its path, and to keep it supplied in the course of its surprise offensive. On the eve of the war, no one in the Red Army was thinking about defensive obstacles. Everyone had his mind on overcoming such obstacles on enemy territory. That is why, under cover of a TASS announcement of 13 June 1939, some Soviet marshals and leading experts on obstacle *clearing* made their secret appearance on the western frontier.

Marshal of the Soviet Union G. Kulik, who had secretly arrived in Byelorussia, discussed the situation with Colonel Starinov. 'Let's have mine-detectors, sappers and trawl equipment!' he demanded (*Miny Zhdut Svoego Chasa*, p. 179) The Marshal was thinking about German territory. All the mines on Soviet territory had already been rendered harmless, and all the obstacles dismantled. 'You have not named your branch correctly,' the Marshal went on to tell him. 'To be in accordance with our doctrine you should call it the branch for the clearance of obstacles and mines. Once we would have thought otherwise, and harped on defence, defence . . . but enough of that!' (*Ibid*, quoted by Starinov) The same problem worried General of the Army Dimitri Grigoryevich Pavlov, the commander of the Special Western Military District. He noted angrily that insufficient attention was being paid to obstacle removal. The Red Army had learnt from its experience in the Finnish security zone, and was carefully preparing itself to surmount the German defences. If only the Soviet marshals had known that the war would begin for them on 21 June, and not as planned in July, then no resources for dismantling mines would have been needed at all.

The German Army broke its own rules and did exactly the same thing. It removed the mines, razed the defences to the ground and concentrated its troops directly on a frontier which had no defensive zone whatever. At the beginning of June, German troops began to remove the barbed wire from the frontier. Marshal of the Soviet Union Kirill Sirnionovich Moskalenko considered this incontrovertible evidence that they would soon begin an aggression. (*Ha Yugo-Zapadnom Napravleny*, Nauka 1960, p. 24)

But of course the Red Army did the same thing very shortly afterwards. The full flower of military engineering thought, including Professor Dimitri Mikhailovich Karbyshev - then a lieutenant-general of engineering troops — came from Moscow to meet on the western frontier. As he left Moscow at the beginning

of June, he told his friends that the war had already begun and arranged to meet them in the 'place of victory.' Once he had arrived on the western frontier, he became feverishly busy. He attended exercises in fording water-defence obstacles, and in surmounting anti-tank obstacles with the latest T-34 tanks, neither of which are needed in defensive warfare. On 21 June, he went over to the 10th Army. But 'before this,' his biographer tells us, 'Karbyshev, accompanied by V. I. Kuznetsov, officer commanding the 3rd Army and Colonel N. A. Ivanov, commandant of the Grodnensk UR [*Ukreplyonnyi Raion* - fortified region] visited the frontier detachment. On the Augustow-Seino road along the frontier, our barbed-wire entanglements were still in place in the morning, but by the time they passed them again on their return journey, the barriers appeared to have been removed.' (E. Reshin, *General Karbyshev*, Izd. DOSAAF 1971, p. 204)

Interestingly, neither the officer commanding the 3rd Army, who had to wage war there, nor the commandant of the fortified zone which in theory was intended for defence, nor the most senior expert from Moscow, who knew that the war had already begun, reacted in the slightest to these measures. On the contrary, the removal of the obstacles coincided with their visit.

Can we imagine the commander of a Soviet frontier sub-unit, an NKVD lieutenant, removing the barbed wire on his own volition? If he were to give such an order, would not his subordinates regard the order as 'clearly criminal'? The lieutenant did give such an order, though, and his subordinates carried it out at the gallop; evidently an order had been received from Lieutenant-General I. A. Bogdanov, the head of the NKVD frontier troops in Byelorussia. Bogdanov clearly realized that war was approaching; on 18 June he took the decision to evacuate the families of servicemen. (*Dozornye Zapadnykh Rubezhei*, Izd. Polit Literatury Ukrainy, Kiev 1972, p. 101)

It is hardly possible that Bogdanov could have decided to evacuate frontier troops' families and, at the same time, to cut the wire, without the knowledge of Lavrenty Pavlovich Beria, the People's Commissar of Internal Affairs and General Commissar for State Security. It is hardly possible that Beria could have made this decision by himself either. Nor did he do so. Beria worked in full co-operation with Zhukov. Above them, Stalin must have co-ordinated the actions of the army and the NKVD. The military and the Chekists were acting in coordination. What is more, they were all in full agreement on essentials, on places and on times.

We are assured that the Red Army suffered its first defeats because it was unprepared for war. This is nonsense. If it had not prepared itself for war, then the barbed wire would have been left intact, if only on the

frontier. This would at least have gained a little time for the army sub-units to bring their weaponry to readiness, and may have averted the fearful catastrophes that followed.

The Chekists certainly did not remove the barbed wire on the frontier in order to allow the German Army to take advantage of the gaps they had opened up. The barbed wire was taken away for other purposes. Try to imagine a situation where, for whatever reason, the German assault had been delayed. What would the Chekists on the frontier have done? Would they have eliminated the frontier barriers, kept the frontier open, and begun again to erect defensive obstacles? Certainly not. There can be only one alternative to this thesis. The Chekists cut the wire in order to allow the 'liberation army' to pass over the enemy's territory, without hindrance, in exactly the same way as they had done before the 'liberation' of Poland, Finland, Estonia, Latvia, Bessarabia and Bukovina. Now Germany's turn had come.

CHAPTER 10

Why Stalin Abolished the Stalin Line

Only naive people believe that the chief task of fortified zones is defence. This is not so. Fortified zones are built so that an offensive may be prepared in greater security. They must also securely conceal the deployment of groupings of shock troops, repel any enemy attempt to disrupt their deployment, and support our troops with all possible fire power when they go over to the offensive.

Major-General PIOTR GRIGORENKO

(Memoirs, New York 1981, p. 141)

In the 1930s, thirteen fortified regions, or URs, were built along the Soviet Union's western frontier, in a strip of territory which was unofficially called the Stalin Line.

Each fortified region was in fact a military formation equivalent to a brigade in numerical strength, but equal to a corps in fire-power. Every region was made up of a command and a headquarters, between two and eight machine-gun and artillery battalions, one artillery regiment, several batteries of heavy caponier artillery, a tank battalion, a communications company or battalion, a sapper engineering battalion and other sub-units. Each region covered an area of 100-180 kilometres along the front, to a depth of 30-50 kilometres. A complex system of combat and supply installations, armoured and built of reinforced concrete, was constructed in the zone; there were also underground premises, built of reinforced concrete, to serve as storage depots, electrical power stations, hospitals, command points and communications centres. The underground installations were linked by a complicated system of tunnels, galleries and overlapping communication trenches. Each UR was capable of waging warfare independently and over a long period in conditions of complete isolation.

The basic element of the fortified regions was the DOT, or permanent fire position. In its issue of 25 February 1983, the newspaper *Red Star* gave a description of DOT No. 112 in the 53rd UR, situated in the Mogilev-Podolsk region. This was one of the completely standard DOTs in the Stalin Line.

It consisted of complex tunnelled fortification defences, which contained communication trenches, caponiers, compartments and filtration systems. It also had armouries, ammunition stores, food supplies, a medical unit, a mess room, water supply (which incidentally is still functioning), a recreation and reading room, and observation and command posts. The armament of the DOT consisted of machine-gun positions with three firing embrasures. In these posts there were three 'maxims' mounted on special turrets and two single-gun caponiers with a ydmrn cannon in each one.

One may take this DOT to be an average one. Besides the DOTs, thousands of small combat structures were built, along with enormous fortification ensembles. General P. Grigorenko describes one of them in his memoirs. Built in the same UR in Mogilev-Podolsk, it had eight powerful DOTs, all interlinked by underground galleries. Colonel P. G. Umansky also took part in building the Stalin Line, and in his memoirs he mentions the underground installations in the Kiev fortified region, where they stretched over a distance of many kilometres (Colonel P. G. Umansky, *Na boevykh mbezkhakh*, Voenizdat 1960, p. 35) Colonel-General A. I. Shebunin, another participant in that mighty work of construction, tells us that in the Proskurov UR alone, more than one thousand reinforced concrete defence-works were constructed in just three years. Many of these were concealed by artificial water defences (Colonel-General A. I. Shebunin, *Skol'ko namiproideno*, Moscow Voenizdat 1971, p. 58)

The construction of the Stalin Line was not advertised like the building of the Maginot Line. The Stalin Line was erected in the total darkness of state secrecy. As every strongpoint was being built, the NKVD 'closed' some parts of it 'to prevent some horrible bird flying around there'. (P. Grigorenko, *Memoirs*) Construction work proceeded in all sectors at the same time, but only in one of the sectors was it genuine - in the other cases it was simply a false front. Both the local inhabitants and many of those who were involved in the building at the time had a mistaken idea of what was being built, and where.

There were many differences between the Soviet Union's Stalin Line and the French Maginot Line. It was impossible to pass round the extreme ends of the Stalin Line, as its flanks rested upon the Baltic at one end and the Black Sea on the other. The Stalin Line was built not just for defence against infantry attack, but primarily for defence against enemy tanks. In addition, it had powerful air-defence cover. The Stalin Line also had greater depth than the French system. Apart from the reinforced concrete which was used to build the Stalin Line, large quantities of armoured steel and granite from Zaporozh'e and Cherkassy were employed.

An important difference between the two lines was that the Stalin Line was built deep inside Soviet territory, and not up against the actual frontier; it was protected by a security zone which would have slowed the enemy's advance and worn him down. It also would have acted like a fog at sea which conceals a chain of icebergs behind it. The fortified zones were camouflaged in such a way that, when the attacking troops came up against Stalin's forts, they would have received an unpleasant surprise.

Unlike the Maginot Line, the Stalin Line was not a continuous whole. The fortified regions were separated by wide gaps. When the need arose, these gaps could have been covered with minefields, artificial defences of all kinds, and field defence involving ordinary troops. They could also have been left open, as if to offer the aggressor the choice of not attacking the fortified regions head on, but of trying to pass between them. If the enemy took the opportunity offered, then the mass of advancing troops would be split up into several isolated lines, each one of which would then have to move forward along a corridor which was under fire on both sides, while its flanks, rear, and lines of communication would be under constant and very serious threat.

We shall see later that the corridors which separated these fortified regions had yet another, altogether different purpose.

The 13 fortified regions of the Stalin Line were built by enormous effort and at vast expense during the first two five-year plans. In 1938, it was decided to reinforce all thirteen fortified regions by building heavy artillery caponiers in them. In addition, the construction of eight more fortified regions began. More than one thousand combat installations were concreted into the new fortified regions in the period of one year.

At that very moment, however, the Molotov-Ribbentrop Pact was signed. The Pact marked the beginning of World War II. It also meant that there was no longer a dividing barrier between the Soviet Union and Germany - they now shared a common frontier.

Stalin could have done a great deal in this very menacing situation to improve the security of the Soviet Union's western frontiers and to guarantee Soviet neutrality in the course of a war. He could, for instance, have ordered that the garrisons on the Stalin Line be strengthened; that the factories producing armaments for the fortified regions should step up their output; that plants which were producing defensive weapons should give priority to anti-tank guns and anti-tank rifles; that the entire construction engineering capability of the country, and its entire resources, be mobilized so that the construction of the Stalin Line be accelerated appreciably; that a start be made on building a second, even stronger defensive system in front of the Stalin Line; that in addition to these two powerful defensive systems, a third belt of fortified zones be built behind the Stalin Line, for example along the eastern bank of the Dnieper; and finally that the troops of the Red Army dig thousands of kilometres of trenches, anti-tank ditches, pits and communication trenches from the Baltic to the Black Sea.

In Autumn 1939, however, when World War II began and a common frontier with Germany was established, all construction work on the Stalin Line was stopped. (V. Anfilov: *Bessmertnyi Podvig*, Moscow Nauka 1971, p. 35) The garrisons in the fortified regions of the Stalin Line were first reduced in size and then disbanded completely. Soviet factories stopped producing armament and special equipment destined for fortification installations. The existing fortified regions were dismantled, and their armament, ammunition and all observation, communications and fire-control equipment were put into storage. (VIZH 1961 No. 9, p. 120) The process of eliminating the Stalin Line gathered speed. Some of the military buildings were handed over to collective farms to be used for storing vegetables; but most of the military installations were covered with earth.

Apart from armaments for the fortified regions, Soviet industry ceased producing many other defensive systems as well. Production of anti-tank guns and 76mm regiment and division guns, which could also have been used as anti-tank guns, was completely stopped. (VIZH 1961 No. 7, p. 101; VIZH 1963 No. 2, p. 12) The anti-tank guns which had already been issued to the troops were not used for the purpose for which they had been intended, but for knocking out enemy firing positions when Soviet troops were on the attack. (Lieu-

tenant-General I. P. Roslyi: *Posledny Prival v Berline*, Moscow Voenizdat 1983, p. 27) Anti-tank rifles were not only taken out of production; they even ceased to be part of the Red Army's armament. (*VIZH* 1961, No. 7, p. 101) Everything connected with defence was mercilessly destroyed and obliterated.

In fairness, however, it must be said that in the summer of 1940, construction began of a belt of fortified regions directly on the new Soviet-German frontier. It was never completed. The Soviet General Staff, not without a certain degree of irony, gave these new fortified regions the unofficial title of the Molotov Line. The decision to embark upon its construction was taken on 26 June 1940. (V. Anfilov, *op. cit.*, p. 162) Construction proceeded very slowly on the new frontier, although the destruction of the old defences went ahead with surprising speed.

The tragedy of the Stalin Line reached its apotheosis in the spring of 1941:

I do not know how future historians will explain this crime against our people. Present-day historians pass over this event in complete silence, and I do not know why. The Soviet government fleeced its people of many billions of roubles (no less than 120 billion, according to my calculations) in order to build fortifications, impregnable to any enemy, along the entire western frontier, from sea to sea, from the grey Baltic to the azure Black Sea. Yet just before war broke out, in spring 1941, powerful explosions thundered along the 1,200-kilometre-long stretch of fortifications. Strong double and single caponiers built of reinforced concrete, firing positions with one, two and three embrasures, command posts, observation posts, and tens of thousands of permanent defensive installations were all blown up on Stalin's personal orders. (Major-General P. G. Grigorenko, *VPodpol'eMozhno Vstretit' Tol'ko Krys*, New York 1981, p. 141)

Thus, the Stalin Line on the old frontier had already been obliterated, while the Molotov Line on the new frontier had still to be built. After the war, and after Stalin died, Soviet generals and marshals chorused their indignation. Chief Marshal of Artillery N. N. Voronov had this to say: 'How could our leadership, having failed

to build the necessary defensive zones on the new western frontier in 1939, take the decision to abolish and disarm the fortified regions on the former borders?' (*Na sluzhbe Voennoi*, Moscow Voenizdat 1963, p. 172)

The Marshal's indignation is false, however. He scolds 'our leadership', but he himself was Colonel-General of Artillery, one of the most senior posts in the Red Army command, at the time. Can it really be that the anti-tank and caponier guns were withdrawn from production without his knowledge? Did he really not know that the Artillery caponiers in the Stalin Line were being stripped of armament and obliterated? Voronov deliberately asks the wrong question in order to distract the reader's attention from the essence of the problem. He seems to think that the Molotov Line should have been built first, and then the Stalin Line broken up afterwards. In putting the question this way, Voronov tacitly justifies the destruction of the Stalin Line; his criticism is not that it was done at all, but only that it was done prematurely.

But why not ask another question - why break up the Stalin Line at all? The events of 1940 had confirmed twice over that two defensive strips are better than one. In 1940 the Red Army paid a high price in blood to break through the Mannerheim Line, compelling Finland to concede to Stalin's demands. Later that year, the German Army passed round the side of the French Maginot Line, broke out on to a broad expanse of territory where it could operate without restriction, and that was the end of the war for France. It is unfortunate that neither France nor Finland had a second line, deep in their heartlands; in that case it is unlikely that either invasion would have succeeded.

Stalin had just such a second line – and then assiduously broke it up. Over the years, Soviet apologists have devised a great number of explanations for this apparent act of folly. One of these is that there was insufficient armament to equip the new fortified regions, so that equipment had to be taken from the Stalin Line. This argument fails on several counts, however. Firstly, if the Molotov Line was short of armament, why were the ordnance plants not ordered to step up production? Not only was no such order given, but the production of standard armaments was actually stopped.

Secondly, the demolition of the Stalin Line began in the autumn of 1939. The arms removed from it were put into storage, because the Molotov Line did not then exist. Indeed, the decision to erect it was not taken until 26 June 1940. So it turns out that first of all the Stalin Line was demilitarized, while later, nearly a year later, the reason, the need and the requirement to do so arose.

Thirdly, the Molotov Line, in comparison to the Stalin Line, was a comparatively weak series of light fortifications, and did not need such a large quantity of armament. In the Western Special Military District of Byelorussia, for instance, 193 combat installations were built on the new frontier, while before that on the old frontier, 876 more powerful combat installations had been disarmed. The ratio of newly built installations to those which had been previously disarmed was still more striking in other military districts. In order to have armed the Molotov Line, therefore, it would have been sufficient to take only *part* of the armament, and a minor part of that, from the Stalin Line. Why then was the armament removed in its entirety from the Stalin Line?

Casement weaponry, machine guns, ammunition, periscopes, communications equipment and gas filters are portable; reinforced concrete installations are not. Even the smallest DOT, with a machine gun and one embrasure, is a reinforced concrete monolith weighing 350 tons, dug into the earth with blocks of granite piled on top of it and covered over with earth, which even had trees growing on it to afford extra defence and camouflage. It was surrounded by ditches and artificial ponds. Could all this have been dragged 200 kilometres westwards?

Even if we accept that the Stalin Line had to be stripped of its armament to equip the new frontier, why blow up its installations? The ordinary foot soldier, armed with his rifle and shovel, can dig a trench to make it difficult and sometimes impossible for the enemy to cross the Line. If you put the same soldier, armed with his rifle or even a light machine gun, not into a mud-hole in the middle of a field, but into even the most simple dismantled DOT, then his tenacity and firmness will increase tenfold. He will have at least one metre of reinforced ferroconcrete over his head, a metre and a half of it in front of him and a metre on each side, all carefully camouflaged from the enquiring gaze of the enemy. If 170 first-echelon Soviet divisions were put into these albeit dismantled boxes, it would have been no simple matter to break through their defences. Defending troops always need something to hold on to: the dismantled forts at Verdun; the bastions at Brest-Litovsk; the walls at Stalingrad; or the trenches in the Kursk salient, which had been abandoned two years previously. Once they have such a foothold, the infantry will dig in in such a way that nothing will smoke them out of their lairs and burrows. They will turn the ruins of a factory, a nineteenth-century bastion or a thirteenth-century citadel into an unassailable fortress.

Even when completely dismantled, the Stalin Line could have provided a line of defence on which the Red Army could have stopped the enemy from reaching the heart of the country. Then the dismantled DOTs, the underground command posts, the excellent hospitals, the concrete-protected store depots, to say nothing of the underground galleries and tunnels, lines of communication and control lines, electrical power stations and water-supply systems, could all have come in useful. But after destroying the Stalin Line, the First Strategic Echelon of the Red Army was moved to the other side of the pre-war frontier. Under cover of the TASS report of 13 June 1941, troops belonging to the Second Strategic Echelon were transferred, in total secrecy, in seven armies to the western areas of the Soviet Union. These armies too were sent beyond the old frontier, and beyond the now dismantled, abandoned and obliterated Stalin Line.

Every soldier knows that defence must be constantly improved; it is one of the most basic requirements laid down by military textbooks. No matter how strong the defences might appear, every soldier will go on doggedly digging up the ground, making the anti-tank ditches wider and deeper, adding a second, third, fourth, and fifth trench to the first one. There is no such thing as an 'adequate' state of defence; if ten anti-tank ditches have been dug, then dig an eleventh.

Soldiers of every army have known this simple truth for many thousands of years now. That is why new defences are built to strengthen and reinforce existing defences, not to replace them. A study of any castle will show that no defence is ever obsolete. An eleventh-century tower will be surrounded by thirteenth-century walls. Around them is a ring of seventeenth-century bastions, which in their turn are ringed by nineteenth-century forts, reinforced by twentieth-century DOTs. According to this basic and universally accepted military principle, the Molotov Line could have served as a complement to the Stalin Line, but never as a replacement for it.

The Molotov Line, however, was created neither as an addition to the Stalin Line nor as a replacement for it, and differed sharply from its predecessor both in concept and in detail. Unlike the Stalin Line, it was built in such a way that it could be seen by the enemy. It was set up in second-grade military sectors, and was not shielded by a security zone, by minefields or other engineered defences. The builders of the Molotov Line did not make use of the many opportunities available to reinforce it, nor were they in any hurry to build it.

The construction of the Molotov Line is just as much an enigma in Soviet history as is the destruction of the Stalin Line. Strange things happened when the new fortified zones were being built. In 1941, vast masses of

Soviet troops were concentrated in the Lvov salient in the Ukraine; a smaller force was concentrated in the Bialystok salient in Byelorussia. Soviet marshals explain that they were expecting the main attack to be made in the Ukraine, and a subsidiary one to be launched in Byelorussia. The main effort made in building the Molotov Line should therefore have been concentrated in the Ukraine, with a secondary drive in Byelorussia. But it had been planned to expend half of all the resources allotted to the construction of the Molotov Line in the Baltic area, a second-grade military sector well away from the expected attack. A quarter of the resources were allocated for Byelorussia, with only nine per cent going to the Ukraine, where according to the assurances of the Soviet marshals 'the main attack was expected.' (Anfilov, *op. tit.*, p. 164)

The fortifications in the Molotov Line were built in second-grade military sectors. For example, six road and railway bridges across the river which formed the frontier in the region of Brest-Litovsk were severed immediately. The main strategic thrust of a war would follow a line running from Warsaw through Brest-Litovsk, Minsk, Smolensk and on to Moscow. These Brest-Litovsk bridges were therefore of the highest strategic importance. A new fortified zone *had* been erected near Brest-Litovsk; but it was far out of the way of the crucial bridges.

The fortified regions of the Molotov Line were built right up against the frontier. They were not protected by a security zone, and in the event of a surprise attack the garrisons would no longer have time to occupy their combat installations and bring their weaponry to full readiness. Unlike those along the Stalin Line, the fortified regions of the Molotov Line were not very deep. Everything which could have been built on the frontier itself, was in fact built there. Defence positions were not built in the rear, nor was it ever planned to build any. (Lieutenant-General V. F. Zotov, *Na Severo-Zapadnom Fronte*, Moscow Nauka 1969, p. 175)

The fortifications were not sited on positions which would favour defence, but followed every bend and twist of the state frontier. The new combat installations were not protected by barbed wire, mines, ditches, stakes, hedgehog entanglements or anti-tank tetrahedrons, nor were any engineered defences erected in the area of construction. Neither were the new installations camouflaged. For example, in the fortified region of Vladimir-Volynsk, 'out of 97 combat installations, 5-7 were covered with earth, while the remainder were virtually de-camouflaged'. (*VIZH* 1976, No. 5, p. 91)

If the reader were to cross the Soviet frontier in the region of Brest-Litovsk, let him turn his attention to the grey concrete boxes which stand almost on the bank itself. These are DOTs which belonged to the southern

tip of the Brest-Litovsk fortified region. They were not covered over with earth at the time, and so remain exposed to this day. The DOTs on the Stalin Line were built in secret, far from the frontier, so that the enemy could not know where the fortifications were, where the gaps between them lay, or indeed whether there were any such gaps at all. Now the enemy could see the entire construction from his side, and learn exactly where the fortifications were. He could make out each separate installation with such accuracy that he could even establish what the line of fire would be from each embrasure. On the basis of this he could determine the entire fire plan and, choosing those strips of land which were not covered by fire, infiltrate himself towards the uncamouflaged DOTs and block the embrasures with sandbags; which is exactly what the Germans did on 22 June 1941.

Marshal Zhukov testified that

the fortified zones were built too close to the frontier and had an extremely unfavourable operational configuration, especially in the area of the Bialystok salient. This enabled the enemy to attack the rear of our entire Bialystok grouping from the area of Brest-Litovsk and Suwalki. In addition, because they lacked sufficient depth, the fortified zones were unable to hold out for long, since they were shot through by artillery. (*Vospominaniya i Razmyshleniya*, APH 1969, p. 194)

Since the Brest-Litovsk and Suwalki areas were so vulnerable to enemy attack, why was use not made of the old, abandoned Russian border fortresses of Brest-Litovsk, Osovets, Grodno Peremyshl' or Kaunas? None of these fortresses is in any way inferior in strength to Verdun, and each could have been turned into an impregnable bastion, thereby raising the stability of the whole defence system. In addition to these fortresses, the regions possessed some old and less powerful fortifications, such as double caponiers, each one intended for a rifle company. The walls and ceilings were of reinforced concrete three metres thick. Colonel Starinov recalled that the head of the GVIU (the Chief Military Engineering Board of the Red Army) 'proposed that use be made of the old Tsarist fortresses near the frontier and set up zones of engineered obstacles. This proposal was never accepted. It was said that it would have served no purpose.' (*Miny Zhdut Svoego Chasa*, Moscow Voenizdat 19, p. 177)

In February 1941, Georgi Konstantinovich Zhukov became Chief of the General Staff of the Red Army. No other marshal or general this century has occupied such a senior post without having suffered even one military defeat. Thus Zhukov, whose greatness had already been proved by his lightning rout of the Japanese 6th Army, held virtually supreme military authority, and might have been expected to bring order to the Molotov Line. Zhukov's arrival, however, did nothing to improve the situation. On the contrary, construction work in the Brest-Litovsk region was given a lower priority. (Anfilov, *op. tit*, p. 166) The meaning of the words 'lower priority construction' need not be explained to the reader who is acquainted with Soviet reality. In practice, it means that construction is almost completely frozen. But even this coin has another side to it. Captured documents of the German 48th Motorized Corps show that the German High Command had formed an altogether different impression. The German troops saw intensive construction work going on day and night; what was more, at night the work took place under floodlights.

What is one to make of this? Were the Soviets really such idiots as to betray their construction sites on the frontier by floodlighting them every night? How can one reconcile 'lower priority construction' with this frenetic burst of floodlit building? One is drawn to the inevitable conclusion that the Molotov Line was built, as Marshal of the Soviet Union I. Kh. Bagramyan put it, as a 'deliberate display'. In his memoirs, Colonel-General Sandalov records a conversation with Mikhail Ivanovich Puzyrev, the commandant of the Brest-Litovsk fortified zone. 'I brought the fortified zone right up to the frontier itself,' Puzyrev told him. 'It was very unusual. Before, we had always built the DOTs a certain distance from the frontier. But there was nothing to be done about it here. We had to be guided by political, and not only by military considerations.' (*Perezhito*, Moscow Voenizdat 1966, p. 64)

This presents us with another enigma. The Soviet troops were concealed in the woods, forbidden to show themselves 'so as not to provoke a war'. But at the same time, as a result of political considerations unknown to us, they were importunately displaying to the enemy their intensive preparations for defence, without fear of provoking any diplomatic or military complications.

How can one reconcile all these conflicting facts? As usual, the apparent inconsistency of Soviet military planning is put down to sheer stupidity. I should have accepted this explanation but for one snag. The Stalin Line and the Molotov Line were the work of the same man, Professor D. Karbyshev, lieutenant-general of the engineering troops. On the Stalin Line he did everything right, well up to the level of world standards and

higher. He provided for everything: the careful camouflaging of every DOT, the great depth of every fortified region, the engineered defences, the security zone and much else.

But then the Molotov-Ribbentrop Pact was signed and one of the world's most brilliant military engineers suddenly became stupid, and everything he did had been wrong. Above Karbyshev stood the great Zhukov. Everything he did was right, both earlier and later. But suddenly, in the first half of 1941, Zhukov changed into an idiot and had begun to issue idiotic orders. It was just at the time of Zhukov's arrival at the General Staff that 'the fortified zones on the old frontiers were disarmed to their previous state, while construction on the new frontiers went ahead at a snail's pace'. (Starinov, *op. tit.*, p. 178)

The story about stupid Stalin, stupid Zhukov and the idiot Karbyshev will not hold water, for the reason that at that very same time Adolf Hitler and the German generals were doing exactly the same thing. They took exactly the same decisions, but no one considered what they did to be idiotic.

Between 1932 and 1937, particularly strong fortifications had been built on the banks of the Oder to protect Germany from attacks from the east. They were first-class combat installations which blended into the surrounding terrain and were very well camouflaged, and rank among the highest achievements of military engineering in the first half of our century.

Once the Molotov-Ribbentrop Pact was signed, the German army moved east and these splendid fortifications were abandoned, *never again* to be occupied by troops. Many combat installations were used to satisfy other needs. In the Hochwald region, for example, there was a powerful fortification complex containing 22 four-storey combat installations, connected by a 30-kilometre underground tunnel. All this was handed over to the aircraft industry to house a plant which produced aircraft engines. Having moved out to meet the Red Army in the middle of Poland, the German troops began to build a new line of fortified regions. They were built in secondary sectors, right up against the Soviet frontier. Neither minefields nor engineered defences were put down in front of the new fortified regions.

Work went on day and night. The Soviet frontier guards saw what was going on, and reported it 'to the proper quarters'. (*Pogranichnye Voiska SSSR 1939 — iyun' 1941, Sbornik doku-mentov i materialov*, Moscow Nauka 1970, Document Nos. 344 and 287) Construction work went ahead intensively until May 1941, after which,

as Soviet jargon would have it, the defences were 'regraded to the category of non-first priority'. Of 80 combat installations planned to be built on the banks of the frontier river San, only 17 were completed. All of these were inadequately camouflaged. In comparison with the defences on the old German frontier, these were light installations. The walls and ceilings were each 1½ metres thick, and the armoured component parts 200mm. each. On the old frontier on the Oder line, the armoured component parts had been much stronger, with thicknesses up to 350mm.

Exactly the same thing was being done on the Soviet side. On the Stalin Line there were strong armoured cupolas and very heavy armoured parts; in the building of the Molotov Line on the banks of the same river San, Soviet engineers used comparatively thin armoured parts of a thickness of up to 200mm. When I was a Soviet officer, one frequently saw German and Soviet DOTs on opposite sides of the same small river. If photographs of the DOTs were shown to an expert, and he were asked to say where the German and Soviet DOTs were, he would not be able to tell the difference.

Why did the German commanders fail to erect as many strong fortifications on their new frontiers as they had done on their previous border? Because they had no intention of defending themselves for a long period in that place.

A defensive fortification is one thing and an offensive fortification is another. Before launching an attack every general must act in accordance with one of the main principles of strategy and concentrate great masses of troops in very narrow sectors; thus the German troops were concentrated in two salients in the Suwalki and Lyublin areas, while Soviet troops were concentrated in two salients in the areas of Lvov and Bialystok. In order to assemble these shock groupings in the main sectors, the secondary sectors would have to be denuded of their resources, even if nerve were needed to do this. These sectors should have previously constructed fortified zones, so that they should not be left completely exposed. The fire-power and combat installations in these zones would enable fighting troops there to be released for battle.

An offensive fortified zone should be placed to one side of the main axis; your troops will advance over the frontier bridges. Fortifications are not needed here. But, on the side where there are no bridges, your troops must be withdrawn and you must erect a fortified zone in their stead. This will allow a comparatively small garrison to control fairly wide expanses of territory. Offensive fortified zones do not need to have depth. You do not intend to defend yourself here for long. There is no need to put down minefields round about; all the

gaps will be used by your own troops when they move on to enemy territory. The best approach is to move up the DOTs to the frontier river itself, so that when the offensive begins they can be used to give fire support to the advancing troops. There is, of course, no need to build positions in the rear, for by doing so you condemn a part of your garrisons and caponier armament to inactivity. It is better to bring them all up to the frontier itself. Your defensive construction works should not be camouflaged; let the enemy see your defensive building, and let them conclude that you are preparing only for defence.

That was exactly what the German generals did. Not long before, in August 1939, Zhukov had operated precisely in this way at Khalkhin-Gol: 'By these measures, we strove to give the enemy the impression that there was a total absence of preparatory measures of an offensive nature on our side, and to show that we were carrying out extensive works, the purpose of which was to organize defence, and only defence.' (Zhukov, *op. cit.*, p. 161) The Japanese were successfully deceived. They took Zhukov's 'defensive' works at face value, and paid the price when they fell to his crushing lightning strike.

After that, Zhukov did the same thing on the German frontier, although on a much larger scale. But he did not succeed in taking in the German generals; they were familiar with this strategy, having used it themselves. On 22 August 1939, just two days after Zhukov dealt his surprise strike at Khalkin-Gol and while the Molotov—Ribbentrop negotiations were in progress, the German Army was preparing to go into Poland. General Guderian was ordered to take over the 'Fortification Headquarters Pomerania'; the aim was to lull the Poles by making purely defensive preparations. At the same time, he quickly constructed some comparatively light fortifications in secondary sectors, so that a few more fighting troops might be released to take part in the main attack.

Guderian was again building defences in the spring and summer of 1941, but this time it was on the Soviet frontier. If Guderian was building concrete pillboxes on the bank of a river on the frontier, it in no way meant that he was thinking about defending himself. It signified the exact opposite. And if Zhukov was ostentatiously building exactly the same kind of boxes on the bank of the same river, what could that mean?

The Stalin Line was multi-purpose. It could be used to defend the country or serve as a springboard for attack. Wide corridors were therefore left between the fortified regions to allow the mass of Soviet troops to pass through on their way to the west. After the frontier had been moved a couple of hundred kilometres to the west, the Stalin Line completely lost its importance as a fortified springboard for further aggression; and once the Molotov—Ribbentrop Pact had been signed, Stalin no longer had any intention of thinking in terms of defence. This is why the Line was dismantled and then broken up. It was in the way of that great mass of troops who had their sights secretly fixed upon the German frontier. It would also hinder the process of supplying the Red Army with the millions of tons of ammunition, food supplies and fuel it would need on its victorious 'liberation' campaign. The corridors between the fortified zones were perfectly adequate for both military and economic needs in peacetime, but in the course of a war, rivers of consignments of supplies would have to be split up into thousands of little streams, so that they would be invulnerable to enemy counter-action. The fortified regions squeezed transport columns into comparatively narrow corridors. That sealed the fate of the already redundant Line.

Exactly the same situation existed in Germany, on both its eastern and western frontiers. Ever since the Franco—Prussian War, German attacks on France had been traditionally planned to come from the north. The Siegfried Line was built in the 1930s, to the south of this sector; that is, in a secondary sector. The German Army passed far to the west in 1940, and the Siegfried Line turned out to be unnecessary. Since it never occurred to Hitler at the time that four years later he would have to defend himself on his own borders, the Siegfried Line was abandoned. It was turned to account in a very original way. Its combat installations were handed over to farmers for storing potatoes. Some installations, which were fitted with impregnable armoured doors, were simply locked up. When the need arose to open them again, no one could find the keys. (K. Mallory and A. Ottar, *Architecture of Aggression*, Architectural Press, 1973, p. 123)

One may, of course, call outstanding Soviet and German generals idiots, but there was no idiocy here. They were simply aggressors. Both thought in terms of attack, and when their fortifications could no longer be used for the purposes of attack, they were either demolished to make way for their advancing troops or, if the opportunity arose, their combat casements were handed over to farmers for storing potatoes.

CHAPTER 12

Partisans or Saboteurs?

*Hitler will attack the West, with his main forces,
while Moscow will wish to take full advantage of
its position.*

TROTSKY (BO, Nos. 79-80, 21 June 1939)

After the Molotov-Ribbentrop Pact had been signed, the Soviet Union began the systematic destruction of the neutral countries, so that it could 'move up in all its mass to the German frontier just at that time when the Third Reich had become involved in a conflict to carve up the world'. The 'liberation campaigns' proceeded apace, but in Finland a pause occurred. As we have already seen, the Red Army was caught in the Finnish security zone.

Here is a classic situation. A Soviet column of tanks, motorized infantry and artillery is moving along a road through the forest. No one can step off the road, either to the right or to the left, because there are mines there. There is a bridge ahead. The sappers have checked it has not been mined. The leading tanks roll on to the bridge, and the tanks, along with the bridge, go up in the air. Explosive charges had been placed inside the supports of the bridge when it was built. It is not so easy to detect that this has been done, and even if the charges were detected, any attempt to remove them would result in an explosion. Thus the Soviet column, winding like a huge snake across many kilometres, comes to a halt on the road. Now comes the turn of the Finnish snipers. They are in no hurry – crack, crack. Silence descends on the forest. Then crack, crack again. The snipers are firing from somewhere in the distance. They hit only the Soviet commanders. Crack, crack. And commissars as well. It is impossible to comb the woods. We have not forgotten that on either side of the road are impassable minefields. Any attempt by Soviet sappers to approach the blown-up bridge or to defuse the mines on both sides of the road will be ended by a single shot from a Finnish sniper. Crack! The Soviet 44th Rifle Division, which was bottled up on three parallel roads by three blown-up bridges, lost its entire

command staff in one day of fighting. At night the Soviet column is raked by rifle mortar fire from somewhere in the depths of the forest. Sometimes long bursts of machine-gun fire hit the helpless column from somewhere behind the undergrowth. Then all falls silent again.

It is said that the Red Army did not show itself at its best in Finland. That could not be more true. But what would any other army have done in its place? Pull the column back? But the heavy artillery tractors with their great howitzers on tow would not have been able to push their trailers backwards, as these weigh many tons. The snipers now hit the tractor drivers — crack, crack. Finding itself in trouble, half the column goes into reverse and moves backwards. But behind it meanwhile, another bridge has been blown up. The column is now trapped. All the approaches to this bridge have been mined as well, and here too the snipers can take their time. They fire at the commanders, the commissars, the sappers, the drivers — crack, crack. Ahead lies the almost inaccessible line of Finnish reinforced-concrete fortifications, the Mannerheim Line. It is impossible to break through it without artillery and without thousands of tons of ammunition. When the Soviet troops came up against the Finnish fortifications, their heavy artillery was far behind, lying immobilized on roads through the forests, between minefields and blown-up bridges, under sniper fire.

Having been taught such a lesson in Finland, the Soviet commanders must surely have drawn the appropriate conclusions? Surely light partisan detachments would have been set up even in peacetime in the western parts of the USSR to face a possible enemy invasion? Nature herself could have created the western regions of the Soviet Union expressly for partisan warfare on the communications of any aggressor moving eastwards.

Stalin did indeed form such detachments as far back as the 1920s. In Byelorussia alone, there were in peacetime six partisan detachments, each with a strength of between 300 and 500 men. If these numbers seem small, one must bear in mind that the detachments were composed only of commanders, organizers, and specialists of the highest quality. Every peacetime partisan detachment was a nucleus around which powerful formations of several thousand men could be formed at the outbreak of war.

Secret bases for peacetime partisan formations were set up in impassable forests and on little islands in the boundless marshes. Underground shelters, hospitals, storage depots and underground workshops for producing arms and ammunition were all built in peacetime. In Byelorussia alone, arms, ammunition and equipment sufficient for 50,000 partisans were placed in underground caches for use in a possible war.

Secret schools were set up to train these partisan leaders, organizers and instructors. Secret scientific research centres worked on developing resources for use in partisan warfare, including special equipment, arms and communications equipment. The partisans went on periodic training courses, on which the OSNAZ divisions of the NKVD usually assumed the role of the enemy.

In addition to these partisan formations, small underground groups were trained, but not to take to the forests when the enemy struck. Their purpose was to remain behind in towns and villages in order to help the enemy and be of service to him, while all the time gaining his trust . . .

Work of this type was not only going on in Byelorussia, but also in the Ukraine, the Crimea and the Leningrad District, among other places. Alongside the activities of the secret police, Soviet military intelligence, in parallel with the NKVD but completely independently of it, was engaged in exactly the same work, equipping secret bases, shelters, secret billets and rallying points, and equipping lines for clandestine communications. The military intelligence had its own secret schools, its own organizers, its own instructors.

The Communist Party was also training many of its leaders in the western parts of the country, with a view to their going underground in the event of the territory falling into enemy hands. With their long-standing criminal traditions, the communists knew how to keep their secrets. These traditions went back to their underground activities of the 1920s and 1930s; where the need to arise, many Party organizations could again become deeply conspiratorial centres of secret conflict.

These partisan detachments were set up in what was termed the Death Zone — the Soviet security zone where, in the event of Soviet troops being withdrawn, all bridges had to be blown up, tunnels demolished, railway junctions rendered completely unusable, railway points, crossings and even rails and telephone cables lifted and carried off to the interior. The partisans remained behind only to ensure that the targets which had been destroyed were not restored. The partisans were virtually invulnerable; their leaders knew the ways through the vast minefields, and could shake off any pursuit by heading for the mined forests and marshes, into which the enemy had no means of finding a way.

All this constituted an excellent system of defence: the Stalin Line; the vast security zone in front of it with its boundless minefields; and the partisan detachments, ready to operate from the first minute of war. But in 1939, Hitler found himself in a very troublesome strategic situation, where he had to wage war in the west,

not the east. From that moment onwards, Stalin's defensive systems were no longer needed. The Soviet partisan movement was abolished at the same time as the Stalin Line and the security zone. Partisan detachments were disbanded, arms, ammunition and explosives removed, the secret dug-outs and store depots covered with earth, and the partisan bases laid waste. All this happened in the autumn of 1939. But as autumn drew to its close, the Red Army began its 'liberation' of Finland, and there it encountered all those elements of self-defence which until recently had existed in the Soviet Union: the line of reinforced-concrete fortifications, the security zone in front of it, and the light partisan-like detachments operating in this zone. After he had been taught a severe lesson in Finland, did Stalin perhaps then change his mind and set up new partisan formations in the western regions of the Soviet Union? He did not.

On 22 June 1941, numerous improvisations were set in motion, including the formation of a partisan movement. Set up at the last minute, it only grew to its full power in 1943-44. Had Stalin not abolished it in 1939, it would have attained its full strength in the first days of the war, and would then have been many times more effective.

As the war progressed, the partisans had to pay a high price in blood for every bridge they detonated. Before a bridge could be blown up, it had first to be captured, and then guarded while the surrounding trees were felled and the adjacent ground mined. But where were the partisans to find explosives? If any could be found, how much could the partisan group carry along with it? While the detonation was being prepared, the charges had to be hastily put in place, not in the bridge supports but *on* the spans. The enemy could quickly repair such a bridge once it had been blown up, and then the partisans would have to start all over again from the beginning. While the enemy was repairing one bridge, the other bridges would still be functioning, so the enemy could regulate his flow of transport.

Previously, however, everything had been made ready to blow up *all* the bridges, in such a way that no partisan blood would have been spilt. To blow them up by simply pressing a button in a secret partisan bunker, and then, from the far side of impassable minefields, to pick off the officers, the sappers and the drivers with snipers' rifles. The German Army was exceptionally vulnerable on the roads. The *Blitzkrieg* could be slowed down considerably by the complete absence of bridges, by hundreds, thousands and indeed millions of partisans' mines on the roads, by ambushes, and by sniper terror from the first hours of the invasion.

Who then abolished the Soviet partisan movement at the very moment that World War II began, and why? GRU Colonel Professor I. Starinov, one of the fathers of Soviet military terrorism, commanded a secret school in those years which trained partisan groups which were under the command of Soviet military intelligence. In his excellent memoirs, the Colonel names the culprit: 'Arms and explosives which had been safely hidden in the ground were waiting for their time to come. But before that hour struck, the concealed partisan bases were laid waste, unconditionally, knowingly and, for certain, on Stalin's direct orders.' (*Miny Zhdut Svoego Chasa*, p. 40)

KGB Colonel S. Vaupshas, one of the veterans of Soviet political terrorism, was at that time commanding an NKVD partisan detachment in Byelorussia. He explains the reason why the partisan formations were abolished: 'In those menacing pre-war years, the doctrine of war on foreign territory was in the ascendancy. It was of a clearly pronounced offensive nature.' (*Na Trevozhnykh Perekrestkakh*, Moscow, IPL, p. 203)

One may agree with the KGB colonel, or one may dispute what he said. No one else, however, has yet offered any other reason why these partisan bases and formations were eliminated.

Once Stalin had done away with the partisan formations in 1939, he did not dismiss the partisan leaders. After the war had ended, much material was published in the Soviet Union on the war and the period which preceded it. I have collected the case histories of dozens of people who were being trained in 1939 to fight in partisan formations in the western parts of the Soviet Union. After 1939, the fate of these people was identical. They were either sent off to OSNAZ formations of the NKVD, or else they found themselves joining very small groups near the Soviet Union's western frontier, for some unclear purpose.

Take the two colonels we have already met, Starinov and Vaupshas; two veterans, one from military intelligence, the other from the secret police. On 21 June 1941, Colonel Starinov found himself in the frontier town of Brest-Litovsk, in an area of railway lines leading to the bridges across the frontier. He did not go there to blow up the bridges. He had left Moscow a few days earlier, he was told, on an exercise. But when he arrived at the frontier, he was told that there would not be any exercises. So this experienced saboteur sat down at the frontier to await further orders. Here is an interesting detail which we shall require later. A

soldier named Schleger worked for Starinov as his driver from the day the war began. He was a German national.

The war came to the Chekist S. Vaupshas, not in the frontier area, but on enemy territory. Vaupshas had a surprising life history. For many years, up to and including 1926, he fought in a Soviet partisan detachment on Polish territory and killed people in order to further the world revolution. After that he became one of the managers of the great GULAG building sites. Later, in the course of the civil war in Spain, he protected and controlled the Politburo of the Spanish Communist Party and the Spanish Security Service. After that, Vaupshas became leader of a partisan detachment in Byelorussia. After the partisan detachments earmarked for a defensive war had been abolished, Vaupshas, having been given the command of an OSNAZ battalion of the NKVD, set off to 'liberate' Finland. Finally, in 1941, this terrorist, this GULAG overseer and scourge, was transferred to the territory of the probable enemy' in order to carry out some secret mission there.

Perhaps he was sent there for some defensive purpose? No: because as soon as the defensive war began, he immediately returned to Moscow.

CHAPTER 12

Why Did Stalin Need Ten Airborne Assault Corps?

In the battles to come, we shall operate on the territory of the enemy. That is prescribed by our rules. We are military people, and we live according to these rules.

COLONEL A. I. RODIMTSEV
(from his speech at the 18th Congress
of the Party, 1939)

Airborne assault troops are intended for attack. Countries concerned only with their defence did not need them. Before World War II, there were two exceptions. Hitler was getting ready for aggressive wars, and in 1936 he created his airborne assault troops. By the time that World War II began, the parachutists among these troops numbered 4,000. Stalin was the other exception. He established his airborne assault troops in 1930. By the beginning of the war, the Soviet Union had *more than one million* trained paratroopers - 200 times more than all other countries in the world put together, including Germany.

The Soviet Union was the first country in the world to create airborne assault troops. When Hitler came to power, Stalin already had several airborne assault brigades. A parachute psychosis was already raging in the Soviet Union. The older generation can remember the time when no municipal park could get by without a parachute tower, and the parachutist's brevet became an indispensable symbol of macho masculinity for every young man. It was not at all easy to obtain such a brevet; they were only given to those who had made real parachute jumps from an aircraft, and the only persons who were allowed to make such jumps were those who had previously passed tests in running, swimming, shooting, grenade-throwing (both long-distance and precision), in surmounting obstacles, in the use of anti-chemical defensive resources and in many other skills indispensable in war. Parachute-jumping was in effect the concluding stage of the individual training given to future soldiers of the airborne infantry.

In order to appreciate the seriousness of Stalin's intentions, it must not be forgotten that the parachute psychosis reigned in the Soviet Union at the same time as did the terrible famine. Throughout the country, the bellies of children were swollen with hunger, but Comrade Stalin was selling grain abroad in order to buy parachute technology, to build great silk-producing complexes and parachute factories, to cover the country with a network of airfields and aero clubs, to put up parachute towers in every municipal park, to train thousands of instructors, to build drying rooms and storage depots for parachutes, to train one million well-fed parachutists and to buy the arms, equipment and parachutes they needed.

Parachutists are not needed in a defensive war. To use a parachutist as ordinary infantry in defensive warfare would be a ridiculous waste of resources. Sub-units of paratroopers do not have to carry the same heavy weaponry as the ordinary infantry do, and therefore their stability in defensive battle is considerably lower.

The cost of training of one million Soviet parachutists was dear, and Stalin paid for the training of these parachutists and for their parachutes with the lives of Soviet children in great numbers. For what purpose were these parachutists trained? Certainly not to protect these children who were dying of hunger. People in our village in the Ukraine still remember the young woman who killed her own daughter and devoured her body. Everyone remembers it because she killed *her own* daughter. They do not remember those who killed the daughters of others. In my village people ate belts and boots. They ate acorns in the bedraggled wood nearby. The reason for all this was that Comrade Stalin was preparing for war. He was preparing as no one had ever before prepared. True, all these preparations turned out to be unnecessary when the defensive war came.

Airborne assault troops are not necessary in a defensive war. There is no point in throwing them into the rear of the enemy in such a conflict; it is much simpler to leave partisan detachments behind in the forests as you withdraw.

It could be argued that these million Stalinist parachutists were simply material from which combat sub-units - battalions, regiments, brigades - would be established. Sub-units had to be set up and given intensive training.

In the 1930s, the western regions of the country were repeatedly shaken by very large-scale manoeuvres. These manoeuvres had only one theme. That was the operation in depth, a surprise attack launched by a vast number of massed tanks striking to a great depth. The scenario was always simple, but formidable. In the course of each exercise, the surprise attack by the land troops would be preceded by a no less unexpected and no less crushing strike by the Soviet Air Force against 'enemy' airfields. This would be followed by a parachute assault landing with the purpose of capturing the airfields. This first wave of parachutists would be followed by a second wave of paratroopers carrying heavy weapons, who would land by plane and then disembark on the captured airfields.

In the course of the manoeuvres held in Kiev in 1935, a parachute assault force of 1,200 men was dropped, immediately followed by an air-landed assault force of 2,500 men armed with heavy weaponry including artillery, armoured cars and tanks.

In Byelorussia in 1936, in the course of practising the same offensive theme, a parachute assault force of 1,800 men was dropped. They were followed by an air-landed assault force of 5,700 men armed with heavy weaponry. In the same year, the full complement of the 84th Rifle Division made an air-landed assault in the course of offensive manoeuvres in the Moscow Military Division.

In 1938, as he could see the 'liberation campaigns' coming, Stalin established a further six airborne brigades with a strength of 18,000 parachutists. In 1939, Stalin abolished the partisan bases and formations which had been intended to operate on their own territory, and established new assault landing sub-units, regiments and detached battalions. In the Moscow Military District, for example, three regiments, each made up of three battalions, were set up along with several detached battalions, each one with a strength of between 500 and 700 men. (*Ordena Lenina Moskovsky Voennyi Oknig*, Moscow 1985, P. 177)

Soviet assault landing brigades made their first parachute landings in combat conditions in June 1940. The 201st and 204th Brigades landed in Romania, and the 214th in Lithuania, near its frontier with East Prussia. Both assault landings seriously worried Hitler, especially the landing in Romania. The entire German Army was concentrated in France at the time, and Romania was the source of its oil supplies. Had Soviet transport aircraft gone 200 kilometres further before discharging their loads, Germany would have been left without oil, the very life-blood of war.

In 1940, Stalin crushed all the neutral countries dividing the Soviet Union from Germany, so that the two powers now shared a common frontier. Stalin ought then, it would seem, to have reduced his airborne units; all that lay to the west was Germany and its allies, with whom the Soviet Union had signed a non-aggression pact.

But Stalin did not disband his airborne units. On the contrary, in April 1941 five airborne corps were secretly deployed in the Soviet Union. All five were set up in the western regions of the country. In order to appreciate the magnitude of this development, it must be remembered that even today there is not one formation in existence any where which has the full right to bear the title of airborne corps. A corps is too large and too expensive to maintain in peacetime.

In addition to the usual assault landing infantry, the airborne corps had fairly powerful artillery and even battalions of light amphibious tanks. All the corps were given intensive training for airborne assault warfare. They were concentrated in woods far from the gaze of outsiders. They were all established sufficiently close to the frontier for them to be dropped on target countries without further redeployment to more forward bases. The 4th and 5th Corps were aimed at Germany, the 3rd at Romania, and the 1st and 2nd at both Czechoslovakia and Austria. One of their missions was to cut the oil pipe-lines in the mountainous areas through which they passed on their way from Romania to Germany.

The Directorate of Airborne Troops was set up in the Red Army on 12 June 1941, followed by another five new airborne corps in August. This second series of airborne corps was not intended as a response to the German invasion, for it is quite impossible to use paratroopers in such massive numbers in a defensive war. Of all the corps of the second series, not one fought in the war in its proper function. Of all the corps in the first series, only one corps was used as intended and on only one occasion, in the course of a counter-offensive in front of Moscow. A third series of airborne corps came later, and one of these corps made an air assault landing in 1943.

The five corps of the second series are a good example of the Red Army developing through inertia. The decision to establish these corps was taken before the German invasion, and was never countermanded. In any event, the parachutes, the weaponry and even the paratroopers in the airborne corps of the second series were all prepared before the German invasion.

Apart from the airborne corps, brigades and regiments, there were also a great number of airborne battalions in the ordinary Soviet infantry. Marshal Bagramyan states that in early June 1941, in the 55th Rifle Corps which was then deployed on the Romanian frontier, intensive training was being given to several parachute assault landing battalions. Judging from Bagramyan's description, as well as from other sources, it seems that the 55th Rifle Corps (there were in all 62 rifle corps in the Red Army) was more the rule than the exception.

Apart from purely parachute sub-units, some ordinary rifle divisions were trained to make air-landed assaults in the rear of the enemy. On 21 June 1941, for example, a specially trained division mounted an air-landed assault in the rear of the 'enemy' in the course of exercises being held in the Siberian Military District. Until then, all Soviet experiments in airborne assault landings were carried out in the western regions of the country. So why should such experiments suddenly be taking place in Siberia? Because at that point in time all the troops in the Siberian Military District had already been secretly combined into the 24th Army which was about to turn up on the German frontier. The 24th Army was carrying out its final exercises before boarding the westbound trains. No comment is called for on the objectives at which this training was directed.

No country in history, or indeed all countries in the world put together, including the Soviet Union, has ever had so many paratroopers and air assault landing sub-units as Stalin had in 1941. If one counts up all the airborne troops in the world, including the Soviet airborne troops in existence at the end of the twentieth century, the total comes to only thirteen divisions, of which eight are Soviet. The reasons which impelled Stalin to establish airborne troops in such numbers, and especially the furious pace at which these extremely powerful airborne corps were set up in 1941, have still to be studied and explained.

While gathering material on Soviet airborne troops, I turned my attention to an interesting detail. Each Soviet commander with the rank of colonel or major-general who at that time either belonged to the airborne forces or was preparing to join them, had sergeants and soldiers of German extraction in his immediate entourage. One commander had a German working for him as his personal driver. Another had a German batman, while a third had a German orderly. Each of these Soviet commanders speaks of it as though it were an amusing

detail of no importance. They say, of course, that the Germans began the war, and here am I with a driver who is a German. But he is a good lad, of course, disciplined and devoted. Colonel K. Stein, who commanded the 2nd Brigade of the 2nd Airborne Corps had a soldier of German origin as his batman. Colonel A. Rodimtsev, the commander of the 5th Brigade of the 3rd Airborne Corps had a German driver. This, incidentally, is the same Rodimtsev who proclaimed at the Party Congress that the Red Army would fight only on enemy territory.

I happened to hear Rodimtsev make a speech when he had become a colonel-general. He was very eloquent. He said that in 1942 his guardsmen were holding the very last houses right on the Volga in Stalingrad. His brigade, like everyone else, had to be re-cast into ordinary rifle divisions, and so they had had their parachutes taken from them. They were given defensive weapons instead, and they acquitted themselves not at all badly in the fighting. But in 1941 neither Rodimtsev nor his subordinates had any thought for defence. They had no defensive weaponry, nor had they studied defensive tactics. But they had studied offensive tactics, and they did have parachutes.

At the beginning of 1941, Stalin needed paratroopers, more paratroopers and still more paratroopers. Many Soviet generals and senior officers hastened to change the branches in which they were serving. A particularly high number of commanders got ready to leave the cavalry, which had outlived its time, in order to become paratroopers, including Rodimtsev himself. To do this, an ability to speak German was essential. Cavalry general Lev Dovator's widow, writing in the newspaper *Red Star*, recalled the beginning of 1941: 'There was one German in our regiment. So Lev Mikhailovich brought him home pretty well every day. They practised, you see, in conversation. And by the time the war started, he could already speak German fluently.' (*Red Star*, 17 February 1983)

The Red Army's links with the German communists were close and long-standing. When he came to the Soviet Union, Ernst Telmann himself was in no way shy about appearing in Soviet military uniform. Walter Ulbricht was enrolled as a soldier in the 4th German Proletariat Rifle Division. That was done for effect, but there were other less obvious things going on. As early as 1918, the Special School for German Red Commanders was set up in the Soviet Union. It was run by Oscar Obert, a German communist. The school changed its name more than once, first becoming secret, then overt, then secret again. The school turned out quite a few combat commanders of German nationality. Some of the graduates from the school attained the

rank of general in the Red Army. At the beginning of 1941, many graduates of this and other similar schools aspired to march under the combat banners of the Soviet airborne corps.

A study of publications on the Soviet airborne corps which were formed in 1941 leads us to the conclusion that the number of officers, NCOs and soldiers bearing clearly German surnames was, not to put too fine a point on it, higher than normal.

CHAPTER 13

The Winged Tank

The air force must be rendered ineffective and destroyed on the airfields . . . Success in putting the air forces out of action on the ground depends on the surprise element in the action taken. It is important to catch the air forces on the airfields.

Marshall. S. KONEV (VIZH, 1976,
No. 7, p. 75)

Training hundreds of thousands of paratroopers and providing parachutes for their use was only part of the task. Military transport planes and gliders were also required. The Soviet leaders understood this very well. That is why the parachute psychosis of the 1930s was also accompanied by a glider psychosis. Soviet glider pilots and their gliders were well up to world standards, and indeed higher. By the beginning of the Second World War, out of eighteen world gliding records, thirteen were held by the Soviet Union.

The best builders of Soviet military aircraft were sometimes deflected from their main work in order to make glider planes. Even Sergei Korolev, who was later to create the first sputnik, was set to work on developing gliders, which he did with great success. If builders of war planes and ballistic missiles were put to work on making gliders, the purpose was obviously not simply to win world records. Had Stalin been interested in breaking records, why did he not put the best minds to work on creating new racing bicycles?

That Soviet gliding was heading in a military direction is beyond dispute. Even before Hitler came to power, the Soviet Union had seen the creation of the first airborne cargo glider in the world, the 6-63, made by the plane builder Boris Dmitriyevich Uralpov. Heavy gliders were invented which were capable of lifting a freight-carrying vehicle. P. Gorokhovskiy even created an inflatable rubber glider; after they had been used behind enemy lines, they could be loaded on to a transport aircraft and returned to their own territory to be used again.

The Soviet generals were dreaming of throwing not only hundreds of thousands of airborne infantrymen into the West, but hundreds and possibly thousands of tanks as well. Soviet aircraft designers were looking hard for a way in which to realize this dream by the most simple and least expensive means. Oleg Antonov, who was later to design the largest military transport aircraft in the world, suggested that the ordinary tank, produced in series, should be fitted with wings and a tail unit, and its hull used as the framework for the whole of this surprisingly simple construction. This system was given the initials KT, which stood for the Russian words for 'winged tank'. The switchgear for the air vanes was fixed on to the tank cannon. The tank crew controlled the flight from inside the tank by means of turning the turret and raising the barrel of the cannon. The entire construction was astonishingly simple. Of course, the risks involved in flying in a tank were unusually high, but then human life was cheap.

The KT flew in 1942. There is a unique photograph of a tank, complete with wings and tailpiece, flying through the air, in a book (*Soviet Tanks and Combat Vehicles of World War Two*, 1984) published by Stephen Saloga, a prominent Western tank expert.

Just before landing, the tank engine started up and its caterpillar tracks began revolving at maximum speed. The KT then landed on its own tracks and gradually braked. The wings and tailpiece were then discarded, and the KT became an ordinary tank again.

Oleg Antonov missed the beginning of the war with his winged tank; hostilities did not begin as Stalin had planned, and this extraordinary machine turned out to be just as unnecessary as the million parachutists.

The Soviet plane designers had their mistakes and failures, their frustrations and defeats. But their successes were beyond doubt. The Soviet Union entered the war with many times more gliders and glider pilots than the rest of the world put together. In 1939 alone, the Soviet Union had 30,000 trainees simultaneously under instruction in glider-flying. Piloting skills often attained a very high standard. In 1940, for example, a demonstration was given in the Soviet Union of a flight of eleven gliders being towed by one aircraft.

Stalin did everything to ensure that there were enough gliders available for his pilots. It was not single-seater sports gliders that he had in mind, of course, but multi-seater ones built for airborne assault. The end of the 1930s saw intensive competition between more than ten Soviet aircraft design offices to see who could

create the best airborne assault glider. Apart from the winged tank, Oleg Antonov also designed the multi-seater A-y airborne assault glider; V. Gribovsky invented the excellent G-II airborne assault glider; D. N. Kolesnikov designed a glider, the KZ-20, which could carry twenty soldiers; while G. Korbula was working on the design of a jumbo glider.

In January 1940, the Central Committee (that is to say Stalin) ordered that a Directorate for the Production of Airborne Assault Transport Gliders be set up under the Peoples' Commissariat for the Aviation Industry. 1940 was taken up with intensive preparatory work, but from spring 1941 onwards, mass production of airborne assault gliders began in the plants operating under this new directorate.

This burst of glider production has interesting implications. The gliders produced in the spring of 1941 would have to have been used in the summer of that year, or by early autumn at the latest, since it would have been impossible to keep them safe until 1942. All the hangars, and there were not very many of them, had long been crammed full of the gliders which had already been produced. It would have been simply out of the question to keep a great airborne assault glider in the open air for any length of time, exposed to the rains and winds of autumn, to frosts and to heavy snowfalls weighing many tons.

The mass production of airborne assault transport gliders in 1941 meant that they were intended to be used in 1941. If Stalin had intended to throw hundreds of thousands of his paratroopers into Western Europe in 1942, then the mass production of gliders would have had to be planned for 1942.

The glider is a means of delivering cargoes and groups of paratroopers without parachutes. Paratroopers equipped with parachutes are conveyed into the areas behind enemy lines by military transport aircraft. The best military transport plane in the world at the outbreak of war was the legendary American C-47 or 'Dakota'. This excellent aircraft, albeit under another name, formed the base upon which Soviet military transport aviation was built. For some reason or other, the United States government sold Stalin the licence to produce it before the war, along with the highly complex equipment which it needed. Stalin took full advantage of this opportunity. So many of these C-47s were produced in the Soviet Union that some American

experts believe that, when the war began, the Soviet Union had more of these aircraft than the United States did.

In addition to the C-47s, the Soviet Union also had several hundred obsolete TB-3 bombers, which had been down-graded to military transport aircraft. All the large-scale airdrops which took place in the 1930s were made from TB-3 aircraft. Stalin had enough of them to airlift several thousand parachutists and heavy weapons, including light tanks, armoured cars and artillery, simultaneously.

No matter how many military transport aircraft Stalin built, he would have had to use them intensively, day and night, over a period of weeks or months if he wanted to carry a great body of Soviet paratroopers into the enemy hinterland, and then keep them in supplies. This gave rise to the problem of how to keep the aircraft undamaged on their first trip, so that they could make subsequent runs. The losses of aircraft, gliders and paratroopers on the first trip could be enormous; on the second, they would be even greater, because the element of surprise would have been lost.

The Soviet generals understood this very well. It was obvious that a massive drop of paratroopers could only be achieved if the Soviet Union had absolute supremacy in the air. The newspaper *Red Star* stated quite categorically on 27 September 1940 that it was impossible to land these great numbers of parachutists successfully without air supremacy.

The *Field Service Regulations* is the basic document, graded top secret, which lays down the procedures for Red Army operations in war. The issue which was in force at the time was *Field Service Regulations 1939*, known as PU-39. It lays down simply and clearly that an 'operation in depth' in general, and a mass drop of parachutists in particular, can only be carried out in conditions where the Soviet Air Force has supremacy in the air. The *Field Service Regulations*, as well as the *Operational Air Force Regulations* and the *Instructions on the Independent Use of Air Force* all envisaged a vast strategic operation to be carried out in the initial period of the war, with the purpose of knocking out the enemy's air power. According to the design of the Soviet Command, air arms from various fronts and fleets, the air arm of the High Command and even the fighter arm of the Anti-Aircraft Defences (PVO) all had to take part in that operation. These regulations considered that the element of surprise was the main guarantee of the success of the operation. The surprise operation to knock out enemy air power had to be carried out 'in the interests of the war as a whole'. In other words, the

surprise strike at the airfields had to be so powerful that the enemy air force would not be able to recover from it before the war ended.

In December 1940, at a secret meeting attended by Stalin and members of the Politburo, a senior commander of the Red Army discussed the details of such operations. These were called, in Soviet jargon, 'special operations in the initial period of war'. General Pavel Rychagov, the officer commanding the Soviet Air Force, insisted on the necessity of camouflaging the Soviet Air Force's preparations in order to 'catch the whole of the enemy air force on the ground'.

It is quite obvious that it is not possible 'to catch the whole of the enemy air force on the ground' in time of war. It is only possible to do so in peacetime, when the enemy does not suspect the danger.

Stalin created so many airborne troops that they could only be used in one situation: after a surprise attack by the Soviet Air Force on the airfields of its enemy. It would be simply impossible to use hundreds of thousands of airborne troops and thousands of transport aircraft and gliders in any other situation.

MAP I

As soon as Britain and France declared war on Germany, the Red Army began to destroy its own defensive systems. The Soviet Command was no longer interested in defending its own territory.

The 'death' zone is a security zone against a surprise attack from the West. Inside this zone, all transport, communications and water supply systems and industrial installations were made ready for demolition. Minefields and other engineered obstacles were set up to a depth of up to 150 kilometres. The zone was completely cleared of mines in the autumn of 1939.

Partisan detachments and bases had been set up in peacetime. They were dissolved in September 1939.

In the fortified regions of the 'Stalin Line', the work of demilitarization and destruction began in autumn 1939.

The combat operations zone of the Dnieper Naval Flotilla. The Flotilla was disbanded in June 1940.

MAP 2

The First Strategic Echelon of the Red Army.

The Soviet invasion armies of the First Strategic Echelon. Behind them, another seven Soviet armies were making their way to the frontier.

The deployment of the First Strategic Echelon rendered the defence of the Soviet Union almost impossible. Even a very low-powered strike by the enemy in this direction would have led immediately to the loss of five Soviet armies, including the 9th, which was the most powerful in the world, and the loss of vast material wealth, highly fertile lands, the undefended bases of the Black Sea fleet, and strategic air bases. It was precisely such a strike which the First German Tank Group delivered in June 1941 . . .

The 9th Army was concentrated not on the German border, but on the frontier with Rumania. A 9th Army strike at Rumania would be a strike at the undefended oil 'heart' of Germany.

The mountain invasion armies. This was the only possible direction in which they could have moved, along undefended ridges. They would have made it possible both to cut Germany's oil 'jugular' and to prevent the movement of German reserves into Rumania.

The 'first wave' airborne corps. Another five airborne corps were secretly being formed deep inside the Soviet Union.

MAP 3

How the Red Army was prepared to seize and destroy the Rumanian oil-fields.

The Ploesti oil-fields, Germany's chief source of oil.

The main pipelines for supplying oil to Germany and for loading it on to river- and sea-going tankers.

The Soviet Danube Naval Flotilla and the only possible way of using it in an offensive war. In a defensive war, the Flotilla would be unnecessary.

The Third Airborne Corps and the zone of its possible operational use. The Corps was set up in April 1941.

The 9th Army was secretly deployed on 14 June 1941, as TASS stated that the Soviet Union was not preparing for war.

The combat task of the 9th Army, according to the evidence of Air Marshal A. Pokryshkin.

The assault crossing of the Danube by divisions of the 9th Army's 14th Rifle Corps. Previously prepared and carried out in the first days of the war.

The 30th Mountain Rifle Division, part of the 9th Army, and the only place where it could be used for its intended purpose.

The 18th (Mountain) Army, secretly deployed on 13 June 1941, and the only possible direction which its operations could have taken. There are no other mountains in this region.

The 19th Army, the most powerful in the Second Strategic Echelon, was transferred from the Northern Caucasus. It contained mountain rifle divisions which could only have been used in Rumania.

The 9th Special Rifle Corps, in collaboration with the Black Sea Fleet, began intensive training in carrying out a naval assault landing operation on an enemy shore.

And overleaf

The Black Sea Fleet subjected the principal Rumanian oil port of Constanza to an artillery bombardment in the first days of the war.

The 4th Long Range Bomber Corps had Ploesti as its principal target in the event of war.

The 63rd Air Brigade of the Black Sea Fleet was specially trained to raid targets in the oil producing industry including, in the first days of the war, Constanza and the strategic pipelines which cross the Danube.

CHAPTER 14

On to Berlin

Of all the aggressive armies which have ever existed in the past, the Workers' and Peasants' Red Army will be the most aggressive.

(Field Service Regulations of the Workers' and Peasants' Red Army, 1939, p. 9)

Among the many defensive systems which the Soviet Union possessed was the Dnieper Naval Flotilla. The great Dnieper river bars the road for any aggressor bent on moving into the heart of Soviet territory from the west. All the bridges across the Dnieper were mined before 1939, and they could have been blown up in such a way that nothing could have been done to repair them. In all their previous campaigns, German troops had never before had to ford a water barrier as formidable as the Dnieper. In a defensive war, the German thrusts could have been brought to a complete halt, at least in the middle and lower reaches of the river, simply by pressing a few buttons.

It was in order to prevent the fording of the river and the placing of temporary crossings over it that the Dnieper Naval Flotilla was set up in the 1930s. By the beginning of the Second World War, the Flotilla consisted of 120 naval vessels and launches, including eight powerful monitors, each with a displacement of 2,000 tons, armour in excess of 100mm, and 152mm cannons. The Dnieper Flotilla also had its own air arm, as well as shore and anti-aircraft batteries. The left bank of the Dnieper is eminently suitable for action by naval river vessels. A multitude of islands, channels, backwaters and inlets enable even the largest naval vessels to take cover and launch surprise attacks to forestall any attempt to ford the river.

The formidable barrier formed by the Dnieper, the bridges ready to be detonated, and the river Flotilla working in cooperation with the field troops, artillery and air force, could have safely barred the way to the industrial regions of the southern Ukraine and the Soviet bases on the Black Sea. The German *Blitzkrieg* could have been stopped on the river-banks, or at least held up there for several months. Had that happened,

the war would have taken an entirely different course. But as soon as Hitler turned his back on him, Stalin ordered that the mines be cleared from the Dnieper bridges, and that the Flotilla be disbanded. The Dnieper Flotilla could be used only on Soviet territory, and only in a defensive war. Since Stalin was not anticipating a defensive war, he had no need for the Flotilla.

Instead of one defensive flotilla, Stalin then created two new ones, the Danube Flotilla and the Pinsk Flotilla. The Soviet Danube Flotilla was formed before the Soviet Union acquired an outlet to the Danube. In the course of Zhukov's 'liberation campaign' in the Romanian frontier regions, Stalin took Bukovina and Bessarabia from Romania. Right at the mouth of the Danube, a sector of the eastern bank of the river, some dozens of kilometres long, passed into the possession of the Soviet Union. The Danube Flotilla, which had already been set up in expectation of this event, was moved there immediately. To transfer ships there from the Dnieper was no easy matter. A few vessels were transported across by rail, while the larger ones were brought through the Black Sea when the weather was calm.

The Danube Naval Flotilla included about 70 naval river vessels and launches, sub-units of the fighter air force, and anti-aircraft and shore artillery. The conditions where the base had to be built were frightful. The Soviet bank of the Danube Delta was barren and exposed. The vessels had to moor at open berths, with Romanian troops sometimes only 300 metres away.

In the event of a defensive war, the entire Danube Flotilla would have fallen into a trap the moment hostilities began. The enemy could simply rake the Soviet vessels with machine-gun fire, preventing them from raising anchor and casting off. In a defensive war, moreover, the Danube Naval Flotilla would have had no useful function. Given its location, there were simply no defensive tasks for it to fulfil. The Danube Delta consists of hundreds of lakes, impassable swamps and hundreds of square kilometres of reed marshes. It is the last place through which an enemy would choose to attack the Soviet Union.

There was only one way to explain the siting of the Danube Flotilla; its purpose was to carry out combat operations upstream while Red Army troops were making a general advance. If you gather 70 river vessels in the delta of a great river, they have nowhere to go except upstream. This meant that they would have to operate on the territory of Romania, Bulgaria, Yugoslavia, Hungary, Czechoslovakia, Austria and Germany.

The Danube Flotilla was of no use to anyone in a defensive war, and it was condemned to be destroyed immediately in its open moorings on a bank raked by enemy gunfire. In an offensive war, however, the Danube Flotilla would be a mortal danger to Germany. It only had to move 130 kilometres upstream for the strategic bridge at Chernavada to come under fire from its guns. That in its turn would mean that the flow of oil from Ploesti to the port of Constanza would be cut off. Another 200 kilometres upstream and the entire German war machine would come to a halt simply because German tanks, aircraft and submarines would have been left without fuel.

It is interesting that the Danube Naval Flotilla had several mobile shore batteries, equipped with 130mm and 152mm cannons. If the Soviet High Command had really concluded that someone would attack the Soviet Union through the Danube Delta, then it ought to have had the shore batteries dig in immediately, and build reinforced concrete caponiers for them at the first opportunity. Yet no one built any caponiers; the guns were mobile and remained mobile. There was only one way to make use of their mobility, and only one direction in which they could be moved. In offensive operations, mobile batteries accompany a flotilla, moving along the bank and giving fire support to the combat vessels.

The reaction of the commanders of the Danube Naval Flotilla to the beginning of the war between the Soviet Union and Germany was interesting. To the Soviet commanders, the word 'war' did not mean defence, but advance. As soon as they learnt that the war had begun, the Soviet commanders put the finishing touches to their preparations to launch an assault landing operation. The action to be taken by the Soviet Flotilla commanders, and also by the commanders of the 14th Rifle Corps, whose divisions were concentrated in the Danube Delta area, and by the commanders of the 79th Frontier Detachment of the NKVD, had been previously planned and worked out with great care. On 25 June 1941, the Danube Flotilla vessels, under cover of fire from the shore batteries and artillery of the 14th Rifle Corps, landed reconnaissance and sabotage sub-units of the NKVD on the Romanian bank. Regiments of the 51st Rifle Division of the 14th Rifle Corps were next to be landed. Members of the Soviet assault landing force acted swiftly and decisively. A complex operation involving river vessels, aircraft, field, shore and shipborne artillery, and sub-units of the Red Army and the NKVD had been successfully executed with clockwork precision. Everything had been prepared, co-ordinated, agreed and checked many times over. On the morning of 26 June 1941, the red flag was hoisted over the cathedral in the Romanian town of Kilia. A powerful springboard on Romanian territory 70 kilometres

long had fallen into the hands of Soviet troops. The Danube Flotilla prepared for further offensive action higher up the river. It only had to sail another 130 kilometres upstream to cut the oil supplies. In the absence of any resistance, and there was hardly any of that, it could have taken no more than one night to get there. The 3rd Airborne Corps, stationed in the Odessa region, could be dropped to help the Flotilla.

The Danube Flotilla was perfectly capable of moving a few dozen kilometres upstream. It proved this later. Formed a second time in 1944, though without aircraft or heavy monitors, the Danube Naval Flotilla fought its way 2,000 kilometres up the Danube and ended the war in Vienna. In 1941 the Danube Flotilla had considerably more strength and was faced by considerably less resistance from the enemy than was the case in 1944-

Both Hitler and Stalin fully understood the meaning of the expression 'oil is the life-blood of war'. Colonel-General Alfred Jodl quotes Hitler, in an argument with Guderian, as saying 'You want to advance without oil — all right, we shall see what will come of it.' As early as 1927, Stalin was seriously occupying himself with matters related to the approaching World War. For Stalin, the central strategic issue was oil. On 3 December of that year, he declared that 'It is impossible to wage war without oil, and the side which has an advantage in oil has a good chance of victory in the coming war.'

The importance of the oil supply must be borne in mind when trying to decide who was responsible for beginning the war between the Soviet Union and Germany. In June 1940, when no one was threatening the Soviet Union, dozens of Soviet combat river vessels appeared in the Danube Delta. This step was of no defensive significance. It was, however, a threat to the Romanian oil pipelines, which were totally unprotected. It was also to become a mortal threat to the whole of Germany. In July 1940, Hitler held detailed consultations with his generals, and reached the depressing conclusion that it would be no simple matter to defend Romania. If Germany attempted to do so, the supply-lines would be overstretched and would have to pass through mountainous areas. If a large number of troops were to be thrown into the defence of Romania, then western Poland and eastern Germany, along with Berlin itself, would be open to a Soviet attack. Nor would it help to concentrate a great number of troops in Romania and support her at any price; the oilfields could be destroyed by the fires which would break out if Romania became an arena for fighting.

In July 1940 Hitler first expressed the thought that the Soviet Union could be dangerous, especially if German troops were to leave the Continent for the British Isles or for Africa. In a conversation with Molotov on

12 November 1940, Hitler explained that it was essential to keep many German troops in Romania, clearly alluding, for Molotov's benefit, to the Soviet military threat to Romanian oil. Molotov let the allusion pass over his head. That is why Hitler, having thought everything over after Molotov had departed, gave the order in December that Operation Barbarossa should go ahead.

In June 1940, while the German Army was fighting in France, Zhukov, acting on Stalin's orders and without any prior consultations with their German allies, occupied Bessarabia, which was then a part of Romania, and introduced river vessels into the Danube Delta. Were Hitler to take one more step westwards towards Britain, where was the guarantee that Zhukov, again acting on Stalin's orders, would not make another move, of just another 100 kilometres, to deal a fatal blow to the Romanian oilfields?

Hitler asked the head of the Soviet government to remove the Soviet threat to what, in terms of oil, was in effect the heart of Germany. Stalin and Molotov did not remove the threat, thus provoking Hitler to take reciprocal action. B. H. Liddell-Hart, the British military historian who has made a detailed study of this subject, has established that the German plan in June 1940 was very simple. In order to defend Romania from Soviet aggression, a German attack had to be delivered in some other place, in order to draw the Red Army's attention away from the oilfields. In the course of sorting out the options, it was recognized that the blow would have to be both powerful and sudden. The numbers of troops earmarked for such an attack gradually grew, until finally, and this was not recognized at the time, practically all German land forces and a large part of the German Air Force were down to take part in it.

Hitler's calculation was justified. By striking elsewhere, Hitler compelled the Soviet troops to be withdrawn all along the front. The Danube Naval Flotilla was cut off from its troops with no way to escape. Most of its vessels had to be scuttled, while enormous quantities of stores, which had been intended to supply the Flotilla as it moved upstream in the Danube, were simply thrown away.

Hitler's attack was powerful, but not fatal. Macchiavelli observed that a powerful attack which is not fatal entails the death of its deliverer. Stalin recovered from the surprise blow, although he did so with difficulty. He formed new armies and flotillas to take the place of those which had been lost in the early days of the war, and he cut Germany's oil jugular, admittedly several years later than planned.

The reason for Stalin's seizure of Bessarabia in June 1940 is explained in a telegram dated 7 July 1941, which Stalin sent to General of the Army I. Tyulenev, the commander of the Southern Front. Stalin demanded that Bessarabia should be held at all costs, 'in view of the fact that we need Bessarabian territory as a springboard for attack to organize an offensive'. Although Hitler had launched his surprise attack, Stalin was still not thinking about defence. His chief concern was organizing an advance from Bessarabia. An advance from Bessarabia, however, was an advance on the Romanian oilfields.

Stalin made few mistakes in his career. One of the few, but his most important one, was to seize Bessarabia in 1940. He should either have seized Bessarabia and then moved immediately on Ploesti; or else he should have waited until Hitler had landed in Britain, and then seized Bessarabia and the whole of Romania. Either course of action would have marked the end of the 'thousand-year Reich'. Stalin had already taken one step in the direction of the oil, and had captured a springboard for a future offensive. He then stopped to bide his time. By doing this, he revealed his interest in Romanian oil and scared Hitler, who until that moment had been waging war in the west, south, and north, without turning any of his attention to the 'neutral' Stalin.

The Soviet seizure of Bessarabia and the concentration there of powerful aggressive forces, including an airborne assault corps and the Danube Flotilla, compelled Hitler to look at the strategic situation from an altogether different viewpoint and to take the appropriate preventive measures. But it was already too late. Even the Wehrmacht's surprise attack on the Soviet Union could no longer save Hitler and his empire. Hitler understood where the greatest danger was coming from, but it was already too late. He should have thought about it before the Molotov-Ribbentrop Pact was signed.

In Marshal Zhukov's memoirs there is a map showing the location of Soviet naval bases in the first six months of 1941. Among these bases is one near the town of Pinsk in Byelorussia, no less than 500 kilometres from the nearest sea. A naval base in the marshes of Byelorussia is reminiscent of the old Russian childhood joke about a submarine in the steppes of the Ukraine. But there was nothing very funny about this.

After the Dnieper Naval Flotilla had been disbanded, some of its vessels were transferred to the Danube Delta, while others were taken upstream to a tributary of the Dnieper, the river Pripyat'. Far upstream, at a point where the river narrowed to a width of 50 metres, a base was built for the new flotilla.

The Pinsk Naval Flotilla was hardly inferior in strength to the Danube Flotilla. It had no fewer than four large monitors, and some two dozen other vessels, an air squadron, companies of marines and other sub-units. The Pinsk Naval Flotilla could not be used in defensive action. The monitors which had gone there could not even be turned round. If the vessels were needed for defence, they would simply have to return to the Dnieper, for there was absolutely nothing for them to do on the quiet forest river Pripyat', for the enemy could hardly make his way into these impenetrable woods and swampy marshes.

The purpose of the Pinsk Naval Flotilla would have remained incomprehensible were it not for the Dnieper-Bug Canal. Immediately after western Byelorussia was 'liberated', the Red Army began to dig a canal 127 kilometres long from the town of Pinsk to Kobrin. Its construction went on in summer and in winter. Taking part in the building work were sappers belonging to units of the 4th Army, and 'construction organizations of the NKVD', that is, thousands of GULAG prisoners. The fact that Colonel (subsequently Marshal) of Engineering Troops Aleksei Proshlyakov was in charge of the building of the canal indicates that its purpose was purely military. The conditions under which the canal was built were appalling. The equipment sank into the swamps, which left only one way to complete the canal within the time laid down by Stalin. That was to do everything by hand. The canal was built. How much it cost in human lives, scarcely anyone knows. But who "was counting?

The canal linked the Dnieper river basin with the basin of the river Bug. Why? To trade with Germany? But trade went through the Baltic and by rail. It was not possible for cargo ships of any commercial freight-carrying capacity to pass each other in the canal. The journey would be a long one; from the Dnieper to the Pripyat', from the Pripyat' through the canal to Mukhavets, and from there to the Bug (which at that time carried no commercial shipping), and then from the Bug finally to emerge on the Vistula. No, the canal was manifestly not built for trade; its purpose was purely military.

Nor could this military purpose have been the defence of the Bug. The Soviet Union possesses only one small stretch of the Bug near Brest-Litovsk, where the river makes a sharp turn towards Warsaw. No

defensive preparations were being made in these regions. Even the Brest-Litovsk fortress was to have no more than one battalion in the event of war, and that was not for defence, but for garrison duties.

The only purpose of the canal was to let ships pass through to the Vistula basin and thence further westwards. Once the Soviet Union found itself in a defensive war, it had to be blown up to prevent German river vessels from the Vistula from reaching the basin of the Dnieper. All the vessels of the Pinsk Flotilla were blown up as well.

A flotilla was again formed on the Dnieper at the end of 1943. Once again it sailed up the Pripyat', and once again the Soviet sappers built a canal from the Pripyat' to the minor river Mukhavets, which led to the Bug. Admiral V. Grigor'ev, who took over the new flotilla near Kiev in 1943, recalls a conversation with Marshal Zhukov:

'By following the Pripyat' you will reach the western Bug, the Narev and the Vistula leading to Warsaw, and further on to cross into the rivers of Germany, perhaps leading, who knows, even to Berlin itself!' He turned round sharply, looked at me searchingly, and repeated, stressing every word 'To Berlin itself, yes?' (*VIZH*, No. 7, 1984, p. 68)

Admiral Grigor'ev eventually got to Berlin with his flotilla. In *The Marine Infantry in the Forests of Byelorussia* any book on the history of the Soviet Navy, we shall find the symbolic snapshot showing the flag of the Soviet Navy with the Reichstag in the background.

The way things turned out, Stalin arrived in Berlin through responding to Hitler's attack. But this happened in a way which Stalin did not foresee. Had he believed in the possibility of a German attack, he would have put millions of GULAG prisoners to work on digging anti-tank ditches along the frontier. However, Stalin intended to get to Berlin, not in response to an attack, but on his own initiative. That is why the GULAG prisoners and the Red Army sappers were not digging anti-tank ditches, but filling them in and building a canal from east to west.

Let us not forget these GULAG prisoners whom Stalin destroyed in the quagmire of the swamps in 1940, so that the communist flag could one day fly over the capital of the Third Reich.

CHAPTER 15

The Marine Infantry in the Forests of Byelorussia

*We have been taught that wars no longer begin
with the chivalrous calls of 'I'm coming after you'.*

Admiral N. KUZNETSOV,
(*Nakanune*, Moscow 1966, p. 306)

Prior to 1940, the Red Army did not have any marine infantry. It was cheaper and simpler to use ordinary infantry for land battles, and landings on distant shores had not yet entered Stalin's plans.

But then Hitler burst westwards, and turned his unprotected back to Stalin. This imprudent move brought in its train the most radical structural changes inside the Red Army, did away with what remained of defence and sharply reinforced the strike force. In June 1940, while Hitler was invading France, the Soviet marine infantry was born.

At that time, the Soviet armed forces contained two oceangoing fleets, two sea-going fleets and two river flotillas on the Amur and on the Dnieper. The ocean-going fleet was not given any marine infantry; the Pacific and Arctic Oceans for the time being did not interest Stalin. The Amur Flotilla, which protected the Soviet Far East, was not given any marine infantry either. The Dnieper Naval Flotilla, as we have already seen, was divided into two offensive flotillas. Of these, the Pinsk Flotilla, which was deployed in the forests of Byelorussia, was given a company of marine infantry. It is interesting that marine infantry were stationed in the Byelorussian marshes, although there were none on the high seas. A conclusion can be drawn from this as to where Stalin was preparing his defences, and where he was preparing for an offensive.

The Soviet Baltic Fleet, whose only possible enemy could be Germany and its allies, was given a brigade of marine infantry with a strength of several thousand men.

The Soviet marine infantry was given its baptism on 22 June 1941 defending the Liepaja naval base. The base was less than 100 kilometres from the German frontier. It had no land defences and had not been prepared for defence. But according to the testimony of Soviet admirals and of German captured documents,

Soviet submarines were crammed into Liepaja 'like herring in a barrel'. The official history of the Soviet Naval Fleet published by the Academy of Sciences of the USSR openly admits that Liepaja had been prepared as a forward base for the Soviet Fleet to fight an offensive war at sea. (*Plot V Velikoi Orechestvernoi Voiny*, Moscow Nauka 1980, p. 138) The marine infantry in Liepaja were so close to the German frontier that they were taking part in defensive fighting even on the first day of the war, although they certainly had not been formed for this purpose. Ordinary infantry are better for defensive fighting than the marine infantry.

The Danube Naval Flotilla had two companies of land troops, but these are not officially recorded as marine infantry. This, however, is not evidence of a great love for peace. We already know that, even before Germany invaded, at least two Soviet rifle divisions, the 25th Chapaev and the 51st Perekop, which were deployed near the Danube Delta, were trained (and very well trained) to go into action as marine infantry.

The Black Sea Fleet had even more powerful forces. Officially it did not possess any marine infantry, but in early June 1941 the 9th Special Rifle Corps under Lieutenant-General Pavel Batov

was secretly transferred from the Caucasus to the Crimea. This corps was unusual in its composition, its armament, and in the direction which its combat training had been given. On 18 and 19 June 1941, the Black Sea Fleet carried out large-scale exercises on an offensive theme. In the course of these exercises, one of the divisions belonging to the 9th Special Rifle Corps was put aboard warships and carried out an assault landing on the 'enemy' coast. This kind of assault landing had never been practised by the Red Army before.

Moscow attached particular importance to the fleet and the 9th Special Rifle Corps having joint exercises. These exercises took place under the observation of high-ranking commanders who had come specially from Moscow to attend them. One of these officers was Vice-Admiral Ilya Ilyich Azarov. He later recalled how all those taking part felt that the exercises were being held for an ulterior motive, and that they would soon have to put their newly-acquired skills into practice in a real war, which would not, of course, be fought on their own territory. (I. I. Azarov, *Osazhdennaya Odessa*, Moscow Voeniz-dat 1962, pp. 3-8)

If war broke out and the Soviet High Command used the 9th Special Rifle Corps in a way appropriate to its type and the training it had been given, where could it be landed? In theory, there were only three possibilities: Romania, Bulgaria and Turkey. But wherever the corps was landed, it would have to be supplied at once. In order to do this, either more troops would have to be landed, or else Soviet troops would have to hasten to join up with the 9th Special Rifle Corps. In any case, the supplies would have to come through Romania.

By a strange coincidence, the 3rd Airborne Assault Corps was also in the Crimea at the time. They were carrying out large-scale exercises, in which the corps headquarters and staff were airdropped along with brigade staffs.

Soviet historians never link these events together — the exercises of the 14th Rifle Corps in making assault landings from ships of the Danube Flotilla; the 3rd Airborne Assault Corps making assault landings from aircraft and gliders; and the 9th Special Rifle Corps making assault landings from the warships of the Black Sea Fleet. But these events are all connected in place, time, and purpose. They were preparations for aggression on a massive scale; preparations in their final stages.

CHAPTER 16

What are 'Armies of Covering Forces'?

The basic and dominant strategic operational idea behind the modern 'army of covering forces' is active surprise invasion. It is clear from this that the modern defensive term 'army of covering forces' is a screen to conceal a surprise offensive blow to be dealt by the 'invading army'.

*(Problems of Strategic Deployment,
Frunze Military Academy, 1935)*

In the European part of the Soviet Union there were five military districts which shared common frontiers with foreign countries. The First Strategic Echelon was made up of troops from these five frontier districts and three fleets. These frontier and indeed all other districts had divisions and corps in their structure, but no armies.

Armies had existed in the Civil War, but they were disbanded after it had ended. An army is too large a formation to be maintained in peacetime. The only exception was the Special Army of the Red Banner. We cannot take it into account here, however, since this body included all the Soviet troops in the Far East and Trans-Baikal, and also the air force, naval forces, military settlements, and other elements. This vast shapeless creation embraced collective farms and even had its own concentration camps. The unusual nature of this formation was highlighted by the fact that it bore no number, while at the head of its huge organization stood a Marshal of the Soviet Union.

In 1938, for the first time ever in peacetime, two armies, the 1st and the 2nd, were formed in the Far East. It was entirely understandable that the Soviet government should take this step. Relations with Japan were very bad and prolonged periods of hostility frequently overflowed into real fighting in which great numbers of troops were used.

Up until this point, there had never been any armies in the European part of the country since the time of the Civil War. Hitler's coming to power, the economic, political and military crisis in Europe, the direct clash between Soviet communists and the fascists in Spain, the German *Anschluss* in Austria and its seizure of Czechoslovakia; none of these events caused Soviet armies to be set up in the western part of the country.

At the beginning of 1939, the Soviet Union, with the Great Purge behind it, was entering a new era of its existence. Its beginning was marked at the 18th Party Congress by a speech by Stalin, which in Ribbentrop's words was 'accepted with understanding' in Berlin. Soviet foreign policy was rapidly changing course: Britain and France were openly called warmongers, and if Stalin was not actually offering Hitler the hand of friendship, Soviet diplomats were clearly letting Hitler know that if he were to extend his hand, then it would be accepted.

That was the outward face of this new era. In 1939, however, the Soviet Union began to form armies in the European part of its territories. For geographical reasons alone, it would have been impossible to use these armies against the 'warmongers' of Britain and France. Against whom then? Surely not against Hitler, with whom negotiations about *rapprochement* were being held with such enthusiasm behind the scenes?

Thus while Soviet diplomats were 'seeking the road to peace', armies secretly appeared on the western frontiers, suddenly and in whole series: the 3rd and 4th Armies in Byelorussia, the 5th and 6th in the Ukraine, and the 7th, 8th and 9th on the Finnish frontier. These armies were growing in strength, and new armies were being added to them: the 10th and 11th in Byelorussia, and the 12th in the Ukraine.

Communist propaganda sometimes tries to present the matter in such a way as to suggest that the Soviet Union began to form its armies only after the Second World War began. But it was not like this. There is sufficient evidence to prove that Stalin decided to form the armies *before* the war broke out. Even according to official Soviet sources, the armies were set up before the signing of the Molotov-Ribbentrop Pact. The 4th and 6th Armies are known to have been already in existence in August 1939. There is also knowledge of the existence of the 5th Army in July. The 10th and 12th Armies were set up 'before the Second World War began', that is before 1 September 1939. (*Soviet Military Encyclopaedia*) Of the remaining armies, they are also known to have been set up in the areas of forthcoming conflicts, and that these conflicts subsequently broke out there.

Shortly after they had been formed, each of these armies got down to its real task. All seven armies deployed on the Polish frontier were involved in the 'liberation' of Poland, while the three armies on the Finnish border 'helped the Finnish people throw off the yoke of the oppressors'. Three armies were not enough here, so new ones, the 13th, 14th and 15th, were added.

When the Winter War in Finland ended, four Soviet armies on the Finnish frontier appeared to withdraw into the shadows and dissolve. Shortly afterwards the 15th Army appeared in the Far East, the 8th was seen on the frontiers with the Baltic states, while the 9th turned up on the Romanian frontier. 'Requests from the workers' in these countries to come and liberate them were soon forthcoming. And the valiant Soviet armies then liberated Estonia, Lithuania, Latvia, Bessarabia and northern Bukovina. After this, the 9th Army again withdrew into the shadows. Like the 11th Army, it was ready to make an appearance again at any moment. And as we shall see, it did just that.

After the 'liberation' campaigns had been completed, not one of these armies was disbanded, in spite of the vast expenditure needed to maintain them. This was unprecedented in the whole of Soviet history. Until this point, armies had only been formed during wartime, and only in order to fight in war. Now there was no one else left in Europe to 'liberate' — except Germany. It was just at this point that the process of forming new armies was appreciably stepped up.

Two armies, the 16th and the 17th, were established in Trans-Baikal in June 1940. The 16th was set up and deployed in such a way that it could be transferred westwards at any moment. But it is not this army which interests us. The 17th Army is the one which compels our attention. During the Civil War, at the most dramatic moment in the blood-stained conflict to preserve the communist dictatorship, the highest number used in the designation of an army was 16. Throughout Soviet history the number 17 had never been used to designate an army. The appearance of an army bearing such a number meant that the Soviet Union, while at peace and not expecting an attack from outside, had surpassed the highest number ever reached. (Previously this number had been reached on one occasion only, for a brief period in the course of a very bitter war.)

The Soviet leaders clearly understood that in setting up a 17th Army, they were crossing a Rubicon which was not visible to the uninitiated. Even two years previously, the state could not allow itself to maintain even one formation which could have been described by the military term 'army'. Now more armies were being formed than had ever been established in the past. A critical degree in the Soviet Union's power had now been

exceeded. From then onwards, the development of the country would proceed in entirely new conditions of a kind that had never before been encountered.

The creation of the 17th Army was clearly a most highly protected state secret, and Stalin did his best to ensure that it remained a secret both within the country and abroad. The 16th and 17th Armies were formed in such a way that it was almost impossible for them to be seen by outside observers. Extra measures were taken to scotch rumours about growing Soviet military might. The order to set up the 17th Army was signed by Marshal of the Soviet Union K. S. Timoshenko on 21 June 1940. (*Order of the Peoples' Commissariat for Defence*, No. 4, point 3) The next day, Soviet radio broadcast a TASS report. Schulenberg, the German ambassador, unerringly deduced that Stalin had written it himself, and told Molotov, who did not consider it necessary to refute the suggestion.

In the TASS report, Stalin resorted to his favourite device of attributing to his opponents words which they did not use, thus allowing himself easily to 'unmask a lie':

There are rumours circulating to the effect that not just 100, not even 150 Soviet divisions are concentrated on the Lithuanian—German frontier . . .

This is pure invention by Stalin. I have checked British, French and American newspapers, which Stalin exposes here as the slanderers, and there is not one newspaper which quotes such fantastic figures. Having attributed to the Western press something it did not write, Stalin easily refuted this non-existent slander before passing on to his main point:

It is considered in responsible Soviet circles that those who are spreading these ridiculous rumours are pursuing the special aim of casting a shadow over Soviet-German relations. These gentlemen, however, are simply expressing their suppressed desires as reality. They are apparently incapable of understanding the obvious fact that the good neighbourly relations which have been established between the Soviet Union and

Germany as a result of the conclusion of the non-aggression pact cannot be shaken by any rumours or petty propaganda. (*Pravda*, 23 June 1940)

There is some truth in this report. Stalin was quite correct in saying that Soviet troops were not being concentrated on the frontier. But he passed over in silence the fact that, far from inquisitive eyes in the depth of the country, powerful formations were being set up which would one day turn up on the German frontier, also under the cover of another and equally false TASS report.

It is quite obvious that, in their mobility, their technical equipment, and their fire, strike and fighting power, the armies of the 'pre-war period' were immeasurably superior to the armies which fought in the Civil War. But this was not the only difference. Whereas the armies were then dispersed in six different directions, they were now mustered into only two. Against Japan, with whom conflicts were unceasing, there were five armies; while facing Germany and its allies, with whom peace had been signed, there were twelve.

Nor did the rapid process of setting up armies stop there. Yet another army, the 26th, was formed on July 1940 on the German border.

In the Red Army, the sequence of numbers had always been rigorously observed. The next number in the sequence should have been 18. So why was the sequence broken?

Neither Soviet marshals nor eminent communist historians give us the answer to this question. But if a close study is made of the way in which these armies were created, history itself will suggest the answer. The sequence of numbering armies had not in fact been broken; in the summer of 1940 the Soviet leadership set up another *eleven* armies, one directed at Japan, ten at Germany.

The 26th Army was formed on the German border as part of this long series, and its formation preceded that of the others. But all the other armies in the same series were in the process of being set up; at the very least, the decision had been taken to set them up. The formation of these armies was completed somewhat later than that of the 26th Army, but *before* the German invasion began.

The 23rd and 24th Armies made their secret appearances in the western military districts in May 1941. The same month, the phantom army already known to us, the 1st, came floating out of the mists. A few weeks later, another similar army, the 9th, changed from being a vague mirage into a solid reality. On 13 June 1941, the day the TASS report was transmitted, all the other phantoms came into view: the 18th, 19th, 20th, 21st, 22nd, 24th, 25th (against Japan) and the 28th, thus completing the uninterrupted series of numbers.

Officially the formation of all these armies was completed in the first half of 1941. This, however, was only the end of the process. But where was its beginning? Communist historians conceal this, and they do so with good reason. The creation of these armies betrays Stalin's craftiness - while Hitler was the enemy, there were no armies; while Poland was being partitioned, while Soviet and German troops were facing each other, it was sufficient for Stalin to have seven to twelve armies in the west of the Soviet Union. Then Hitler turned away from Stalin, and threw the Wehrmacht into Denmark, Norway, Belgium, Holland and France, with the clear intention of landing in Britain. Hardly any German troops were left on the Soviet frontiers. It was precisely at this moment that the Soviet Union began secretly to set up an enormous number of armies, among them the 26th. The further the German divisions moved to the west, to the north, and to the south, the more Soviet armies were created against Germany. Supposing that Hitler had gone even further, and had landed his troops in Britain, had seized Gibraltar, Africa and the Near East, how many armies would Stalin have then formed on the undefended German border? And for what purpose?

The basis of Soviet strategy was the 'operation in depth' theory: the delivery of surprise strikes in great depth at the enemy's most vulnerable places. The theory of the shock army was born at the same time as the 'operation in depth' theory. The shock army was to be the instrument used to deliver those strikes in depth. Set up purely to solve offensive tasks (*Soviet Military Encyclopaedia*, Vol. I, p. 256), these shock armies had on their complement a considerable quantity of artillery and infantry whose purpose it was to break the enemy's defence, and one or two mechanized corps with 500 tanks each, which would deliver a heavy shock attack in depth.

The German *Blitzkrieg* and the Soviet operation in depth are strikingly similar in both concept and detail. Tank groups were the special instrument which had been created to carry out the *Blitzkrieg*. Three such groups were used in the invasion of France, and four in the invasion of the Soviet Union. Each one usually had between 600 and 1,000 tanks, and on occasions as many as 1,250 tanks, along with a considerable number of infantry and artillery whose purpose it was to break a way through for the tanks.

One difference between the Soviet and German war machines was that in Germany everything was called by its own name, so that the tank groups bore their own numerical designations, while the field armies had theirs. In the Soviet Union shock armies existed only in theory; and although that theory was soon turned into substance, they still did not formally bear the title of shock army. This name was officially introduced only after the Germans had invaded. Before this, all Soviet armies had a single numerical designation, and bore no distinguishing name. This was misleading then, and is misleading now. In Germany we can see the engines of aggression, the tank groups, clearly called by their own names. In the Red Army, we do not see them quite so distinctly. This is not evidence of great peaceableness, however, but rather of excessive secretiveness.

At first sight, Soviet armies are like soldiers in a row. They all look the same. If one takes a closer look, however, the differences quickly emerge. For some months before the 'Finnish aggression' occurred, several armies intended for the 'liberation' of Finland were deployed on Soviet territory. This is how they were made up in December 1939, in the order in which they were deployed from north to south:

14th Army — no corps, two rifle divisions

9th Army — no corps, three rifle divisions

8th Army — no corps, four rifle divisions

7th Army — 10th Tank Corps (660 tanks); three tank brigades (each with 330 tanks); the 10th, 19th, 34th and 50th Rifle Corps (each with three rifle divisions); a detached brigade: eleven detached artillery regiments, apart from those which form part of the complement of the corps and divisions of this army; several detached tank and artillery battalions; and the army's air arm.

We can therefore see that although the 7th Army did not differ in name from its neighbours, it had several times more tanks and artillery than the three other armies put together. In addition, the 7th Army was commanded by K. A. Meretskov, the commander of the Leningrad Military District. A favourite of Stalin's,

Meretskov was shortly to be appointed Chief of the General Staff and later promoted to Marshal of the Soviet Union. Nor was he the only future marshal in the 7th Army. This army was staffed by the most promising officers, who had held senior appointments already and who were to rise even higher in future. L. A. Govorov, for example, the Chief of the Artillery Staff of the 7th Army, also went on to become Marshal of the Soviet Union. The other armies, on the other hand, were led by commanders who had not been prominent in the past, nor would they become so in the future.

The position of the 7th (shock) Army was interesting. The Finnish 'militarists' began their armed 'provocations' precisely in that area where the Soviet High Command, a few months earlier, had deployed the 7th Army, which was thus able to deliver a blow in response. For some curious reason, the Finnish 'militarists' did not stage any provocations in those areas where weak Soviet armies had been deployed.

Soviet organization was extremely flexible. Any army could become a shock army at any time, simply by adding a corps or more to its complement, and translated just as quickly back to its normal state. From being the strongest army in 1940, the 7th Army had by 1941 become the weakest; it no longer had any corps, and consisted of four rifle divisions only.

In order to understand what had been taking place on the Soviet-German frontier, we must make a clear definition of which were shock armies and which were ordinary ones. Officially all armies were the same, and none was called a shock army. Yet some armies had hardly any tanks, while other armies had hundreds of them. In order to identify shock armies, we should make an elementary comparison of the strike power of the Soviet armies with the German tank groups, and with the Soviet pre-war criteria used to define what a shock army was. The element needed to change an ordinary army into a shock one was a mechanized corps organized in a new way, with an establishment of 1,031 tanks. When one such corps was included in an ordinary army, its strike power would become comparable to that of any German tank group, or even exceed it.

Here is a striking revelation. On 21 June 1941, *all* the Soviet armies on the German and Romanian borders, as well as the 23rd Army on the Finnish frontier, were of shock army standard, although, as we have already seen, they were not called such. They were, from north to south, the 23rd, 8th, 11th, 3rd, 10th, 4th, 5th, 6th, 26th, 12th, 18th and 9th. The 16th Army was then added to them. This was a typical shock army, with more than 1,000 tanks on its complement. (Central Archives of the Ministry of Defence of the USSR, Archive No.

208, list 2511, item 20, p. 128) The 19th, 20th, and 21st Armies, which had been secretly moved up to the German border, had already been fully brought up to this standard.

Germany had a powerful engine for aggression in its tank groups. The Soviet Union had a similar engine. The difference lay in their designations and in their numbers. Hitler had four tank groups, while Stalin had sixteen shock armies.

Not all mechanized corps were made up entirely of tanks. But to appreciate Stalin's intentions fully, account must be taken both of what he achieved, and also of what he was prevented from achieving. The German attack caught the Soviet Union in the process of setting up a great number of shock armies. First came the framework for these enormous structures, which was then filled in, completed, and finally put into working order. Not all armies reached the levels planned for them, but this work was proceeding when Hitler interrupted it. He had enough sense not to wait until they were all ready to be turned loose.

Soviet experts at one time used the term 'invasion army'. This term did not have a particularly diplomatic ring, especially for the neighbouring countries with whom Soviet diplomats were doing their best to have 'normal relations'. In the 1930s, this excessively frank term was replaced by the happier-sounding expression 'shock army'. Soviet sources, however, stress that these are one and the same thing. (*VIZH*, 1963, No. 10, p. 31)

But even the term 'shock army', for purposes of disguise, was not used until the war began, even though the greater part of the Soviet Army deserved this title. The Soviet generals then introduced the term 'cover army' to conceal their designs. There are other such terms in communist double-speak. Soviet expressions like 'liberation campaign', 'counter-attack', 'seize the strategic initiative' mean respectively aggression, attack, and beginning a surprise war without declaring it. It is a great pity that some historians, either through ignorance or design, use Soviet military terms without explaining their true meaning to their readers.

The true purpose of a Soviet 'cover army' was to conceal that, in the initial period of a war, the Red Army was fully mobilizing its main forces, deploying them, and then entering the war. 'Cover', however, in no way

meant defence. As early as 20 April 1932 the Revolutionary Military Council of the USSR laid down that powerful mobile invasion groups should be kept near state borders in peacetime, to enable them to cross the frontier immediately war broke out, in order to disrupt the enemy's mobilization and seize strategic reserves and important areas. In the view of the Soviet Union's top military and political leaders, these actions would be the best cover for Soviet mobilization. It was precisely in this sense that the armies in frontier areas were called 'cover armies'.

July 1939 was the time when theory was put into practice, and the creation of 'cover armies' began on the Soviet western frontiers. Stalin was using the Molotov—Ribbentrop Pact to push Hitler into a war with the West, to establish a common frontier with Germany, and to form an increasing number of these 'cover armies'.

Among the ordinary Soviet invasion armies, which usually consisted of one mechanized corps, two rifle corps, and some detached divisions, were some armies that did not conform to the general pattern. There were three of them, the 6th, 9th and 10th. These armies together had not three corps, but six. Two were mechanized, one was cavalry, and three were rifle. Each of these armies was moved as close as possible to the frontier, so that if a large salient developed on the enemy side, the special armies would find themselves precisely in these salients. Each army was equipped with the latest weaponry. The 6th Mechanized Corps of the 10th Army, for instance, was armed with 452 of the latest T-34 and KV tanks. The 4th Mechanized Corps of the 6th Army, had 460 of the latest T-34 and KV tanks, besides others. The air divisions of these armies had hundreds of the latest planes, including the YAK-1, MIG-3, IL-2, and PE-2.

After each army had been fully equipped, it must have had 2,350 tanks, 698 armoured vehicles, over 4,000 guns and mortars and more than 250,000 soldiers and officers. In addition to their basic complements, these armies were given ten to twelve heavy artillery regiments, NKVD units and much else besides.

I do not know what to call these out-of-the-ordinary armies. If we use their official names, the 6th Army, the 9th, and the 10th, then we involuntarily fall into the trap which was set as long ago as 1939 by the Soviet General Staff. We lose our awareness and begin to think of these armies as ordinary shock armies, or ordinary invasion armies. They were completely out of the ordinary; each one of these armies, with more than 2,000 tanks each, was equal to or even exceeded one half of the entire German Wehrmacht, while in quality the superiority of the Soviet tanks was astonishing.

If we call the German tank groups, each with between 600 and 1,000 tanks, engines of aggression, what then are we to call the 6th, 9th, and 10th Soviet Armies?

That was not all, however. The Soviet High Command had a fair number of corps at its disposal which did not belong to these armies, but which were deployed quite close to the frontier. Any ordinary army could be changed into a shock one just by including corps in its complement, and any shock army could be changed into a heavy shock one without changing either its name or number.

Of the three heavy shock armies, it is the most powerful of them, the 9th, which attracts our attention. Not very long before, in the Winter War against Finland, the 9th Army was simply a rifle corps consisting of three rifle divisions with a fine-sounding name. After the Winter War, the 9th Army dissolved into the mists, appeared elsewhere, was dissolved once again, only to turn up yet again under cover of the TASS report of 13 June 1941. It had not yet been brought up to full strength, but was still the unfinished shell for the most powerful army in the world. It had six corps, two of which were mechanized, and one cavalry.

On 21 June 1941, the 9th Army had 17 divisions in all, including two air, four tank, two motorized, two cavalry and seven rifle. It was very similar to other heavy shock armies, but it was planned to add to the 9th Army yet another mechanized corps, the 2yth, commanded by Major-General I. E. Petrov. This corps was established in the Turkestan Military District, and was secretly transferred westwards before its formation had been fully completed. After it had been included, the Army's complement consisted of 20 divisions, including six tank. At full strength, the seven corps of the 9th Army had 3,341 tanks. This was roughly the same number as the Wehrmacht had; in quality, they were superior. According to Colonel-General P. Belov (at that time he was a major-general, commander of the 2nd Cavalry Corps of the 9th Army), it was intended to give T-34 tanks even to the cavalry of this army. (*VIZH*, 1959, No. u, p. 66)

The 9th Army had so far had undistinguished commanders. Then everything changed. The 9th Army was given a colonel-general as its commander. It was an exceptionally high rank at the time. There were only eight colonel-generals in the whole of the armed forces of the Soviet Union, while the tank troops had none, the air arms had none, and the NKVD had none. Thirty Soviet armies were led by major-generals and lieutenant-generals. The 9th Army was the only exception. In addition, some very bright generals and officers had joined this exceptional army, including three future marshals of the Soviet Union, R. Ya Malinovsky, M. V. Zakharov, and N. I. Krylov; A. Poryshkin, a future air marshal and three times Hero of the Soviet Union; and I. E. Petrov,

I. G. Pavlovsky, P. N. Lashchenko, all future full generals of the Army. Many other talented and aggressive commanders, who had already distinguished themselves in battle, joined, including the 28-year-old Air Major-General A. Osipnenko. There is no escaping the impression that somebody's solicitous hand was selecting everything which was best and most promising for this unusual army.

Here we come to a small but significant discovery. The most powerful army in the world was set up in the Soviet Union in the first half of June 1941. It was not set up on the German frontier, but on the border of Romania. After its first disappearance, the 9th Army had suddenly turned up in June 1940 on the Romanian frontier. By this stage, it had already assumed its new capacity as a real shock army. It was soon to participate in the 'liberation' of Bessarabia; Soviet sources indicate that 'the 9th Army was created specially to solve this important problem'. (*VIZH*, 1972, No. 10, p. 83)

The training of the army had been accomplished by the most aggressive of Soviet commanders, K. K. Rokossovsky, who by then had been released from prison. The 9th Army became part of the Southern Front as the key lead army, playing the same role as the 7th Army had done in Finland. The Front was under Zhukov's personal command.

After the brief 'liberation campaign', the 9th Army disappeared again. Then, under cover of the TASS report of 13 June 1941, it turned up again in the same place. By now, though, it was no longer simply a shock invasion army. It had become a heavy shock army, and was on the way to becoming the most powerful army in the world. Its purpose can hardly have been defensive, for there were very few troops on the Romanian side of the frontier. Even if there had been, no aggressor would have delivered his main strike through Romania, for the most elementary geographical reasons. Another 'liberation campaign' by the 9th Army into Romania, however, could have changed the entire strategic balance in Europe and in the world. Romania was Germany's basic source of oil. A strike at Romania would ground all Germany's aircraft, and bring all its tanks, machines, ships, industry and transport to a halt.

That is why the most promising commanders were to be found there. The 9th Army suddenly appeared on the Romanian frontier in the middle of June 1941. But this suddenness was only for the benefit of outside observers; in fact, the 9th Army had never left the area since 'liberating' Bessarabia in the middle of 1940. It was simply that its name had not been used officially for some time, and orders had gone directly to the corps from the headquarters of the Military District. The headquarters of the 9th Army and the headquarters of the

Odessa Military District (established in October 1939) simply merged into one entity and then equally simply separated again on 13 June.

Experience shows that, after a shock army appears on the borders of a small country, an order to 'liberate' the neighbour's territory is sure to follow within the month. Irrespective of how events might have unfolded had Soviet troops invaded Germany (which incidentally was just as unprepared for defence as the Soviet Union was), the outcome of the war could have been decided far from the main battlefields. Stalin was clearly counting on this. That was why the 9th Army was the strongest. That was why, as early as March 1941, at a time when the 9th Army officially still did not exist, there arrived there a youngish, highly audacious major-general named Radion Yakovlevich Malinovsky. This was the same Malinovsky who four years later was to astonish the world with the tremendous strike he delivered across hills and wilderness into the vast heartland of Manchuria.

In 1941 the task facing Malinovsky and his colleagues in the 9th Army was a fairly simple one. They were faced with a distance of only 180 kilometres to traverse, as opposed to 810 kilometres in Manchuria; not across hills and wilderness, but across a plain with really good roads. The attack had to be made, not against the Japanese Army, but against the considerably weaker Romanian one. What is more, it was planned to give the 9th Army three times more tanks than the 6th Guards Tank Army would have in 1945.

Hitler allowed none of this to happen. A German government statement handed over to the Soviet government on the outbreak of war in the East gives the reasons for Germany's action. One of these reasons was that Soviet troops were being concentrated unjustifiably on the frontier with Romania, and that this represented a mortal danger for Germany. None of this has been invented by Goebbels's propaganda. The 9th (heavy shock) Army had been established exclusively as an offensive army. According to evidence from Colonel-General P. Belov, the 9th Army usually 'regarded every defensive problem as short-term, even after German operations had begun on Soviet territory'. (*VIZH*, 1959, No. n, p. 65) But then this was the trouble with not just the 9th Army, but with all the other armies as well.

Three times Hero of the Soviet Union, Marshal of the Air Force A. I. Pokryshkin (then a senior lieutenant and deputy commander of a fighter squadron belonging to the 9th Army) sheds an interesting light on the 9th Army's mood. Here is his conversation with a 'filthy bourgeois', whose shop had been confiscated by his 'liberators'. The scene takes place in the spring of 1941, in 'liberated' Bessarabia:

'Ah, Bucharest! You should see what a fine city it is.'

'I'll certainly see it sometime,' I answered with conviction.

The shop-owner opened his eyes wide, waiting for me to go on. I had to change the subject.

(A. I. Pokryshkin: *Nebo voiny*, Novosibirsk ZSKI, 1968, p. 10)

We have a natural reluctance to believe Hitler's explanation that he launched Operation Barbarossa to defend Germany from a treacherous attack by Soviet troops on Bucharest and Ploesti. But the other side says the same thing; even the Soviet lieutenants knew that they would shortly be in Romania. A Soviet officer is not entitled to wander across frontiers as a tourist. In what capacity could Pokryshkin get there except as a 'liberator'? Hitler did everything he could to prevent this, but all he succeeded in doing was briefly to delay the inevitable.

CHAPTER 17

Mountain Divisions on the Steppes of the Ukraine

Airborne assault landings will be effective in mountainous battle areas. Since troops, headquarters and organs which operate in the rear are particularly reliant on roads, it is possible to use air assaults to capture enemy troops operating in the rear, to attack his communications and roads, commanding heights, ravines, passes, railway junctions and so on, and this can produce exceptionally important results. In general terms, the dropping of an assault landing force will hardly be expedient outside the framework of an offensive operation.

(Voennyi Vestnik, 1940, No. 4, pp. 76-77)

A study of the Soviet armies in the First Strategic Echelon reveals a surprising picture of the Soviet Union preparing itself painstakingly and tirelessly for war. We may be surprised to discover that each army had its own unique structure, its own peculiarities, and its own character. Each 'cover' army was established to deal with a clearly defined task in the forthcoming war of 'liberation'.

Sufficient material has been published to provide for a separate study to be written on each of the 30 Soviet armies. If a study in depth were to be made of the structure, disposition, officer corps and the direction given to the training in only one Soviet army, and it does not really matter which one, then the aggressive tendency inherent in all the Soviet preparations would become quite obvious.

As there is no space available to describe all 30 armies, I shall allow myself to dwell briefly upon one of them. Officially it was called the 12th Army. It had one mechanized and two rifle corps and other units. It had

nine divisions in all including two tank and one motorized. It was indistinguishable in number, name and composition from other similar invasion armies. Its history is the usual one. It was set up when the Molotov-Ribbentrop Pact was signed. A few weeks after it was formed, it set to work, and 'liberated' Poland. It then had a tank corps, two detached tank brigades, two cavalry corps, and three rifle divisions. It was not without purpose that it had little artillery and infantry. There was no need here to break through a powerful defence. But on the other hand there were mobile troops. 'The I2th Army . . . is in essence a front-line mobile group.' (SVE, Vol. 8, p. 181)

Its subsequent history was also normal. It completed the 'liberation' campaign in Poland, but then for some reason or other the army was not disbanded, and it stayed on the German border. For what purpose? It is said that Stalin was naive and believed Hitler. Why then did he not disband his armies, which had been set up for the event of war?

Later the 12th Army underwent the same transformation as all the adjacent invasion armies. Its main strike engine was no longer called a tank corps, but a mechanized corps. This was so that the leaders of neighbouring friendly countries should not become uneasy. The change of name, it is true, was followed by an increase rather than a decrease in the number of tanks in the army. The cavalry was taken away from it. Its capacity for disrupting the enemy's defences was increased. The number of rifle divisions was doubled, as was the amount of artillery in each division. In addition to these, one artillery brigade and four detached artillery regiments were added to the army's complement. The capability to counter the enemy's engineered defences also increased when a detached regiment of engineers was brought into the army.

What was unusual about the I2th Army was its national composition. When he was preparing to invade Poland in 1939, Stalin filled the I2th Army with Ukrainians, apparently bearing in mind the long-standing animosity between the Poles and the Ukrainians. The army was headed by S. K. Timoshenko, and we find a multitude of commanders of Ukrainian origin alongside him. The army was formed in the Ukraine. It follows that the reservists were also drawn from there, and they formed a solid majority in the I2th Army.

After Poland had been 'liberated', a slow and almost imperceptible change in the I2th Army's national composition began. Far-reaching changes had already taken place in 1940. In order that this army's unusual national composition did not become too apparent, ethnic Russians were appointed to key posts. The greater part of the army, however, was neither Ukrainian nor Russian. It had become Caucasian. There were

Georgians, Armenians, and Azerbaijanis in other armies, but their presence was particularly strong in the I2th. There were hundreds of officers' surnames like Partsvaniya, Grigoryan, Kabalava, Gusein-zade and Sarkoshyan. Such officers were not only to be found at command level in companies and battalions. General Zhukov, who commanded the Military District, sought out Colonel I. Kh. Bagramyan, another Armenian who was a friend of long standing, from his job as a military academy lecturer, and appointed him Chief of the Operations Branch (War Planning), not of any old headquarters, but to none other than the headquarters of the I2th Army. Not only the colonels, but quite a few generals, such as Bagrat Arashunyan, the army's chief of staff, now came from the Caucasus.

Zhukov was a frequent visitor to the I2th Army, and it was not without purpose that he was gathering natives of the Caucasus into its ranks. The I2th was being secretly but steadily changed into a mountain army. Zhukov personally demanded of its command that the I2th should have a thorough knowledge of the Carpathian passes, not just on paper, but from practical experience. In 1940, he ordered that 'specially reinforced groups, made up of various combat vehicles and means of transport, should be sent through the passes in autumn along all more or less passable routes, in order to be convinced they could be surmounted in practical conditions by tanks, motor vehicles, tractors, animal-drawn transport and beasts of burden.' (Marshal I. Kh. Bagramyan, *VIZH* 1967, No. I, p. 54)

Hitler was waging war in France, with Germany's back exposed to the Soviet Union. Yet here was Zhukov carrying out experiments in how to master mountain passes. Zhukov was, of course, unaware that the German generals had only recently been carrying out exactly the same experiments in order to reassure themselves that troops, tanks, artillery tractors and transport could pass through the Ardennes. But it was not defence that Zhukov had in mind when preparing the I2th Army. Bagramyan, who was responsible for the war plans, recalled that 'When I was studying the operational plans, I was struck by the following fact - our frontier army had neither a deployment nor cover plan for the frontier.' (*VIZH*, 1967, No. I, p. 52)

'When I was studying the operational plans' means that the safe of the operations branch of the I2th Army was not empty. There were plans inside it. They were not there simply to be familiarized with in a cursory manner. They were complex documents which had to be studied. Yet among these war plans there were none for defence.

There is an interesting description of the 12th Army exercises, which Zhukov attended in person. The problems were all offensive in character, and on the maps the war took place on German territory. The war game was being played against the real enemy, and not some fictitious one, using real top-secret intelligence information; and it began with Soviet troops fording the frontier river San. Differences arose between Zhukov and Parusinov, the officer commanding the army. These were not as to whether to advance or to stand and put up a defence. 'We must do our best,' insisted Parusinov, 'to inflict maximum casualties on the enemy with our first strike.' The wise Zhukov understood that these were good intentions, but a strike had to be made, not on a wide front, but on a very narrow one. That was what the argument was about.

Having demolished the army's commanding officer in military theory, Zhukov did not stop there. Parusinov was shortly afterwards removed from the command of the army, and his place was taken by Zhukov's old friend, General P. G. Ponedelin.

After these changes, the experiments in how to master the mountain passes continued. They were conducted by Bagramyan in person. It was during these experiments that he supervised an 'obvious display of defensive works'; in other words, the construction, in clear view of the enemy, of reinforced concrete fortifications right on the bank of the frontier river.

Zhukov's interest in the passes is highly significant. If his purpose had been to render them impassable to the enemy, he would have thrown his troops into the mountains, dug up all mountain paths and roads, and built reinforced concrete fortifications near the passes, instead of right alongside the river. It would have been more economical, the enemy would not have observed the construction work, and would have been unable to cross the passes. But would anyone really attack the Soviet Union across mountain ranges when there were open spaces in abundance? Mountains were of exceptional importance to the Soviet command. Germany, on the other hand, was separated from its main source of oil by a double barrier of mountains, in Czechoslovakia and Romania. A Soviet strike across the passes in Czechoslovakia and Romania would effectively cut the oil artery.

According to Marshal Zhukov, 'Germany's weak point was oil supply, but it made up for this to some extent by importing oil from Romania.' (G. K. Zhukov, *Vospominaniya i razmyshleniya*, Moscow APN, 1969, p. 224) Everything was simple, but of genius. That Zhukov never suffered one defeat in his whole life was due to his invariably following one simple principle -find the enemy's weak spot, and then hit it with a sudden strike.

The reason why these experiments were going on in the mountains was because Zhukov knew Germany's weak spot. The capabilities of troops of all kinds, and every type of combat and transport vehicle operating in the conditions which prevailed in the Carpathian mountain passes, were subjected to a scientific study. Standards were established and carefully checked, and guidance was compiled for the troops. The time taken by the various types of vehicle to negotiate these mountain passes was carefully recorded and analysed. All this was very necessary for the planning of offensive operations; especially lightning operations. Just as in planning a bank robbery, it was essential to take into account every tiny detail, and to calculate everything with the greatest accuracy. All of this, it should be noted, was totally unnecessary for defence. If the Carpathian passes had to be defended from the enemy, then speed was not needed; all the soldiers had to be told was to stay where they were and not let the enemy pass.

Events went on apace. Zhukov was promoted, as was Bagramyan in his wake. But neither of them forgot the 12th Army. Slowly and unceasingly, its structure was changing under their orders.

As we have already noted, in the 12th Army, as in all other Soviet armies, things were not called by their names at this time. At the beginning of June 1941, four rifle divisions (the 44th, 58th, 60th, and 96th) were converted into mountain rifle divisions. In addition, the recently formed 192nd Mountain Rifle Division was secretly transferred from Turkestan and added to the complement of the 12th Army. What does one call a corps which has two divisions, each of them mountain rifle? What does one call another corps, in which, of its four divisions, three are mountain rifle? What does one call an army which, out of its three corps, has two which are in essence mountain rifle corps, and in which the mountain rifle divisions are in a solid majority? I should call the corps mountain rifle, and the army a mountain army. The Soviet High Command, however, had reasons for not doing this. The corps went on being called, as before, the 13th and 17th Rifle Corps, while the army was simply called the 12th Army.

Here we see only the final results of the reorganization; how it was done is hidden from us. We only know that the mountain rifle divisions were given their official name on 1 June 1941, while the order was issued on 26 April; and that the transformation of the divisions from rifle into mountain rifle divisions was going on as

early as autumn 1940, even before Bagramyan had begun his experiments. Not only was it changed into a mountain army, the 12th also had an influence on adjacent armies. The 72nd Mountain Rifle Division, under the command of Major-General P. I. Abramidze, had been trained in the 12th Army, and was now transferred to the adjacent 26th Army.

Lieutenant-General I. S. Konev's 19th Army, which was being transferred from the northern Caucasus, was then secretly deployed behind the 12th and 26th Armies. We also find mountain rifle divisions on its complement, for instance the 28th Division under the command of Colonel K. I. Novik. It was at this time, again under cover of the T ASS report of 13 June 1941, that deployment began in the area between the 12th (mountain) and 9th (heavy shock) Armies in the eastern Carpathians, of yet another army, the 18th. Hitler did not allow its deployment to be completed, however, and we are unable to establish with any degree of accuracy the shape which the Soviet High Command wanted it to take. Hitler threw all the Soviet plans into disarray and then something quite unimaginable began. But even so, there are sufficient documents to enable the conclusion to be drawn that the original idea was that the 18th Army should be a carbon copy of the 12th (Mountain) Army, although like the 12th, it did not bear this name. Any researcher who studies the archives of the 12th and 18th Armies will be surprised by their absolute similarity in structure. It is a most unusual example of twin armies. The similarity went as far as the same Caucasian general running the headquarters of both the 18th and the 12th Armies in a completely even-handed way. He was Major-General (later full General of the Army) V. Ya. Kolpakchi.

Just before the war began, a school for mountain training was opened in the Caucasus. It trained the best Soviet mountain climbers to be instructors. Once fully trained, these instructors were sent to the Soviet western frontier, since it was precisely here, and not in the Caucasus or Turkestan, that in June 1941 a great number of mountain rifle troops were concentrated. A short article about the school appeared in the newspaper *Red Star* on 1 November 1941, under the heading 'Trained to Fight in the Mountains'.

It is now time to ask the question-in *which* mountains? There is only one comparatively small mountain range on the Soviet western frontiers. This is the eastern Carpathian mass, the heights of which are more like gently sloping hills than mountains. There would have been no point in having a powerful defence in the Carpathians in 1941, for the following reasons:

1. That area of the Carpathians would not favour an aggressor coming from west to east. The enemy would come down from the mountains on to the plain, and so his army would have to be supplied across the whole of the Carpathians, the Tatry mountains, the Ruda and Sudety hills and the Alps. All this is highly unfavourable and dangerous for an aggressor.
2. The eastern Carpathians form a blunt wedge on the enemy's side of the frontier. If many Soviet troops were to be concentrated here, for defensive purposes, even in peacetime they would be surrounded by the enemy on three sides. By making use of the plains further to the south, and especially more to the north of the eastern Carpathians, the enemy could strike at any time at the rest of the troops which had dug themselves in on the mountains, thereby cutting their supply-lines.
3. In 1941, there were insufficient enemy troops in the Carpathians to carry out an aggression, and the Soviet High Command was fully aware of this. (See for example Lieutenant-General Bagrat Arushunyan, VIZH 1973, No. 6, p. 61)

All these factors, which render the eastern Carpathians unfavourable for an aggressive action moving from west to east, make them suitable for an aggression which moves in the opposite direction:

1. As the troops move ahead into the mountains, their supply-lines remain on Soviet territory, mainly lying across very flat terrain.
2. The eastern Carpathians form a blunt salient which juts far out into the west, thereby cutting the enemy grouping in two. This is a natural springboard which, if heavy forces are built up in it even in peacetime, places them as though they were in the enemy's rear. All they then have to do is to continue to move forward, threatening the enemy's rear and thus compelling him to withdraw along the whole front.
3. Only negligible enemy forces were located in the Carpathians. The Soviet High Command knew this, and it was precisely for this reason that they had concentrated two armies there.

The two armies could not stay on the spot; there was no room for them. They were not needed for defence, nor were they adapted to it. There was only one way of using these armies in war, and that was to move them forward. Two mountain ridges spread from the eastern Carpathians. One goes westwards to Czechoslovakia, the other southwards to Romania. Two directions, two armies; it is entirely logical. Each direction was equally

important, for each led to the main oil pipelines. If only one of the armies succeeded, it would still be fatal for Germany. Even in the event of both armies failing, their operations would lessen the flow of German reserves into Romania.

Apart from the two strikes over the mountains at the arteries, there was also the 9th (heavy shock) Army, which was ready to deliver a blow to the heart of the oilfields. Its operations were covered by two main mountain ranges. In order to defend Romania from the Soviet 9th Army, German troops would have had to take these ranges, with an entire Soviet army on each one.

We may disagree over the purposes of the mountain rifle divisions which made up the 12th and 18th Armies, yet these armies were in the Carpathians. But we cannot argue about the purpose of a similar division in the 9th (heavy shock) Army. The 9th was stationed near Odessa, but on the orders of General Zhukov, who bore personal responsibility for both the South and South-Western Fronts, a mountain rifle division was set up as part of the 9th Army. What sort of mountains are to be found near Odessa? The 30th Irkutsk, Order of Lenin, Triple Order of the Red Banner, Supreme Soviet of the RSFSR Mountain Rifle Division of the 9th Army could only have been used for its primary purpose in Romania. It was certainly not by chance that this division, commanded by Major-General S. G. Galaktionov, found itself in the 48th Rifle Corps of General P. Ya. Malinovsky. First of all, Malinovsky was the most aggressive corps commander not just in the 9th Army but on the whole of the Southern Front. On the other hand, the 48th Rifle Corps was on the extreme right flank of the 9th Army. This was of no significance on Soviet territory. But if the 9th Army was moved into Romania, it would be wholly on the plain, and its right flank would be rubbing against the mountain range. It was therefore eminently reasonable to have one mountain rifle division on the extreme right flank.

That was not all. The 21st Mountain Cavalry Division, commanded by Colonel Ya. K. Kuliev, was secretly moved out of Turkestan in military trains. Hitler's attack upset everything, however, and it then became necessary to throw all the forces which had been destined for the south into Byelorussia, including the 19th Army with its mountain rifle divisions. The 21st Mountain Cavalry Division also found itself there. Nobody there needed it; it was not adapted to fighting in the marshlands, and there it ingloriously perished. But it was not for Byelorussia that it had been intended.

The concentration of two Soviet armies in the eastern Carpathians had catastrophic consequences. No one, of course, would have attacked these armies head-on. But the 1st German Tank Group's attack at Rovno put

the Soviet command in a dilemma. They either had to leave the two armies in the Carpathians, where they would perish without ammunition and provisions, or else to withdraw them at once from this mousetrap. The second of these choices was adopted. The two mountain armies, which were unadapted for fighting on the plains, carrying light armament and a mass of equipment which was now redundant, fled from the mountains and immediately came under attack from the spearhead of German tanks. The 1st Tank Group easily routed the fleeing mountain armies and then drove forward to catch the 9th (heavy shock) Army in the rear.

Once again, let Bagramyan speak:

Knowledge of the Eastern Carpathians led to a more clear understanding of how absolutely essential it was to reform as quickly as possible those heavy unwieldy rifle divisions, which were unsuited for action in the mountains, into light mountain rifle units. When I recall this now, I catch myself thinking of how unintentionally mistaken I had been. At the outbreak of war, these divisions in the main had to fight their battles in the conditions prevailing on the plains, so their reformation into mountain divisions only served to weaken them. (Marshal Bagramyan, *VIZH*, 1976, No. I, p. 55)

Once the German troops had dealt with these armies, the road opened out before them to the totally undefended bases of the Soviet Fleet, to the Don Basin, Khar'kov, Zaporozh'e and Dniepropetrovsk. These were industrial regions of the utmost importance; once they were lost to the Germans, the Soviet Union succeeded in producing only 100,000 tanks for the rest of the war years. This was much more than was produced in Germany, but had these regions not been lost, Soviet tank, artillery, aircraft and naval production could have been several times higher than their already record levels.

When the Germans broke through to the south of the Ukraine it put the Soviet troops around Kiev in a very serious position and opened the road for Germany to the Caucasus - the heart of the Soviet Union's oil-production.

Communist propaganda has it that the Red Army was not preparing itself for war, and that this was the cause of all its subsequent troubles. This is not true. Let us retrace, if only through the examples offered by the 12th Army and its carbon copy, the 18th, what *could* have happened if the Soviet Union had really been unprepared for war:

1. There would have been enormous savings of those resources which were simply wasted on setting up two mountain armies and many detached mountain rifle divisions. If only part of these resources had been used to establish anti-tank divisions, the war would have taken a different course.
2. There would not have been two armies in the Carpathians; they would not have had to be extricated in a panic from this mousetrap; nor would they have fallen under the blow from the German spearhead as they were withdrawing.
3. The German massed tanks to the north of the Carpathians would have met with heavyweight divisions adapted to fighting on the plains and equipped with anti-tank guns and many other types of powerful artillery, instead of the light divisions they actually encountered fleeing from the mountains.
4. If the German tank spearhead had broken through the defences of these divisions which were not fleeing anywhere, the consequences would not have been catastrophic, for the enormous build-up of troops on the Romanian frontier would not have been there, and the German strike would have simply landed in an empty space, instead of into the rear area of these troops.

If the Red Army had not been preparing for war, everything would have been different. But it was preparing itself, and very assiduously at that.

CHAPTER 18

The Purpose of the First Strategic Echelon

It has to be borne in mind that it is possible simultaneously to carry out two or even three offensive operations on different fronts in a theatre of military actions, with the intention of strategically rocking the enemy's defensive capability on the widest possible scale.

Marshal S. K. TIMOSHENKO,
People's Commissar for Defence of
the USSR, 31 December 1940

We have dwelt very briefly on some of the armies belonging to the First Strategic Echelon. We saw the most powerful of these armies on the Romanian frontier. We saw the mountain armies destined to cut off Romania — and its oil — from Germany. We saw five airborne assault corps and a special corps for amphibious assault operations. The First Strategic Echelon of the Red Army had in all sixteen armies and several dozen detached corps. There was a total of 170 divisions in this strategic echelon.

Interestingly, Soviet marshals were discussing the role of this echelon *before* the war. Marshal A. I. Egorov considered that the forthcoming war would be one in which millions, and indeed tens of millions of soldiers would take part. But he propounded that an offensive should be embarked upon without waiting until full mobilization had been carried through. It was his opinion that in peacetime it was essential to maintain 'invasion groups' in frontier districts, so that these groups could cross the state frontier on the first day of the war, thus disrupting the enemy's mobilization while at the same time covering that of the Soviets. (Report of the Chief of Staff of the Workers' and Peasants' Red Army to the Revolutionary Military Council of the USSR, 20 April 1932)

Marshal M. N. Tukhachevsky did not agree with this. In his view, what was needed was not 'invasion groups' but 'invasion armies'. Tukhachevsky insisted that

the opportunity to cross the border immediately, along with the declaration of mobilization, must in the first instance dictate the composition of the forward army and the disposition of its troops . . . Mechanized corps must be stationed some 50-70 kilometres from the frontiers, so as to be able to cross the border from the first day of mobilization. (M. N. Tukhachevsky: *Izbrannyye Proizvedeniya*, Moscow Voenizdat 1964, Vol. 2, p. 219)

Tukhachevsky and Egorov were of course mistaken. They had to be shot, and the authoritative, inflexible and invincible General G. K. Zhukov rose to the summit of military power. Least of all was he disposed to abstract thought. He was a practical man who had never lost a military battle in his entire lifetime. In August 1939, Zhukov carried out an operation, staggering in its suddenness and daring, to inflict a crushing defeat on the Japanese 6th Army. (This same method was later to be adapted against the German 6th Army at Stalingrad.) This lightning rout of the Japanese was the prologue to World War II. When Stalin had received Zhukov's telegram of 19 August 1939 reporting that he had achieved his main objective of preparing an attack without the Japanese even suspecting that he had done so, Stalin gave his agreement to the establishment of a common frontier with Germany. It was after this that the destruction of the western defences began, and the large shock formations began to be set up. The Kiev Military District, which was the most important and most powerful of all Soviet military districts, was placed under Zhukov's command. Zhukov was then promoted even higher, to the post of Chief of the General Staff. It was at this point that the General Staff reached a theoretical conclusion of exceptional importance: *'It is necessary to place the execution of the invasion armies' tasks on the whole of the First Strategic Echelon.'* (VIZH 1963, No. 10, p. 31) Thus all sixteen armies of the first Echelon, which contained 170 divisions, were earmarked for invasion.

Not only had the First Strategic Echelon been given the task of carrying out invasion action, but it had actually begun to carry it out. Covered yet again by the TASS report of 13 June 1941, the entire First Strategic Echelon had moved up to the German and Romanian frontiers. Although at this stage there were

only about three million soldiers and officers, the power of the First Strategic Echelon grew swiftly. Marshal S. K. Kurkotkin remembered that 'military units which had left for the state frontier before the war, had taken away with them emergency reserve supplies of uniforms and footwear'. (*Tyl SVS V Velikoi Orechestvennoi Voyny*, Moscow Voenizdat 1977, p. 216) The Marshal states that practically no uniforms or footwear remained in the reserves at the centre. This means that divisions, corps and armies took with them clothing and footwear for millions of reservists. What calculation did they have in mind, apart from an immediate call-up of millions of men?

When speaking of the power of the First Strategic Echelon, mention must not be confined only to how many soldiers it had. A thought must also be spared for the millions whom Hitler did not allow to be called up, clothed and shod close to the frontiers. It was not planned that this awesomely powerful movement of the First Strategic Echelon should come to a halt near the German frontier. That was why Soviet units of the NKVD began to cut the barbed wire on the frontiers on 20 June 1941. The German Army, however, had begun to cut its wire the week before.

CHAPTER 19

Stalin in May

In the fields of foreign policy, Stalin has set himself an objective of the utmost importance, which he hopes to attain by his own efforts.

Count VON DER SCHULENBURG (secret
dispatch dated 12 May 1941)

In order to understand what happened in June 1941, we must inevitably look back to the month of May. It is the most mysterious month in the whole of Soviet history. Every day, every hour of that month is filled with events, the meaning of which can still only be guessed at. Even those events which took place in the full view of a watching world have still not been fully explained by anyone.

On 6 May 1941, Stalin became the head of the Soviet government. This move puzzled many people. We know, for example, from captured German documents that the German leaders were likewise unable to find a satisfactory explanation for this event. For the first time in Soviet history, the supreme authority of the Party and that of the government had been officially placed in the same hands. This did not mean that Stalin's personal dictatorship had been strengthened in any way; if sonorous titles were a measure of power, then Stalin would have been entitled to a magnificent collection of them some ten years earlier. But he chose quite consciously not to take this course, and after he had taken over the post of General Secretary of the Party in 1922, he declined all state and government posts.

Stalin raised his command post *above* the government and *above* the state. He controlled everything, but officially was responsible for nothing.

As early as 1931, Leon Trotsky described the mechanism to be used for preparing the communist *coup* in Germany:

Should the new policy succeed, then all the Manuilskys and all the Remmeles would be given full credit, but the initiative would still have been Stalin's. But in the event of its failure, however, Stalin had kept the way completely clear for himself to find someone to blame. This was the quintessence of his strategy. Stalin was strong in this field. (BO, No. 24, p. 12)

The *coup* did not take place and Stalin did indeed find people to blame, and gave them exemplary punishment. He ruled the internal affairs of the Soviet Union in the same way. The victory of the *kolkhoz* system belonged to Stalin's genius, while millions of victims of the same system perished because of its many enemies and the careerist hangers-on who had distorted the Party line. It made the heads of some of these comrades at regional level swim from their successes. Stalin had no connection at all with the great purges - they were Yezhov's fault! Nor did Stalin sign the Pact with Hitler. The Pact passed into history bearing the names of Molotov and Ribbentrop. In Germany it was Hitler, the Chancellor, more than Ribbentrop who bore the official responsibility for this Pact, although he was not present when the Pact was signed. Stalin, who did attend the signing, did not at that time hold any governmental or state appointments; he attended simply as citizen Joseph Stalin, who had not been invested with any state, governmental, military or diplomatic powers, and consequently was not responsible for what was taking place.

It was in exactly the same way that the treaty with Japan was signed on 13 April 1941. Stalin was present, but he did not bear any responsibility for what was taking place. When Stalin later stabbed Japan in the back, at a critical moment when the country was worn out by war, his conscience was clear; *he* had not signed the Pact.

On 6 May 1941, however, Stalin officially took upon himself the burden of state responsibility. For Stalin, the new title did not strengthen his authority, but restricted it; from that moment onwards, he not only took all the most important decisions but official responsibility for them as well. Stalin's power had been restricted until then only by the Soviet Union's external borders, and not always even then. What could have compelled him *voluntarily* to take upon his shoulders the heavy responsibility for his own actions, if he could have remained at the peak of infallibility, while leaving it to others to make the mistakes?

This entire circumstance somehow reminds me of Khrushchev's famous elk hunt. While the animal was still far off, Nikita shouted at the hunters and chuckled at his guest Fidel Castro, who was not having much success. Khrushchev himself was not in the shoot and did not even have a gun in his hands. But when the animal was being driven towards the hunters and there was no way anyone could possibly miss the mark, Nikita picked up a gun ...

Stalin had never taken the levers of state power into his hands in seventeen years. Why should he do so now? According to evidence given by Admiral of the Soviet Fleet N. G. Kuznetsov, 'when Stalin assumed the chairmanship of the Council of People's Commissars, in practice the system of leadership in no way changed'. (VIZH 1965, No. 9, p. 66)

Von der Schulenburg, the German Ambassador in Moscow, reported to his government that 'I do not know of a single problem related to the internal situation in the Soviet Union which was so serious as to induce Stalin to take such a step. But I venture to assert with considerable confidence that the reasons for Stalin's deciding to take over the highest state post are to be sought in foreign policy.' Soviet marshals agree that Stalin's appointment was connected with external problems. (Marshal of the Soviet Union I. Kh. Bagramyan, *Tak nachinalas' voina*, Voenizdat 1971, p. 62)

So what were the external problems which could have impelled Stalin to take such a step? In May 1941, many European states had been crushed by Germany. Problems concerning Soviet relations with France, for instance, simply could not exist. Britain, which had preserved its independence, offered Stalin the hand of friendship in a letter from Churchill sent on 1 July 1940. Roosevelt's attitude to Stalin was more than friendly, and American technology was already flowing like a great river into the Soviet Union. There were only two potential enemies. But Japan, which had been given a performance of Soviet military might in August 1939, had just signed a treaty with the Soviet Union and was turning its gaze in the opposite direction. Thus Germany alone must have provided the reason for Stalin to take that apparently incomprehensible step.

What could Stalin do in relation to Germany by making use of his new official title of head of state? He had only three options. He could have established a lasting and inviolable peace. He could have declared himself official leader of a future armed conflict on the part of the Soviet Union to repel German aggression. Or he could have officially declared an armed conflict on the part of the Soviet Union in order to wage an aggressive war against Germany.

The first option falls down at once. Peace with Germany had already been signed by Molotov's hand. After he took over Molotov's place as head of state, Stalin did absolutely nothing to meet Hitler and begin negotiations with him. Stalin went on using Molotov for peace talks as before. Molotov was known to have tried to meet the German leaders even on 21 June, but Stalin made no such efforts. This means that, whatever his purpose in taking over this official post, it was not to conduct peace negotiations.

Communist propaganda emphasizes the second option: that Stalin saw the German attack coming, and decided personally and officially to place himself at the head of the country's defence. But Germany's onslaught was manifestly unexpected. On 22 June, the head of the government was obliged to address the nation and break the terrible news. But Stalin avoided meeting his direct obligations, which were fulfilled by Molotov, his deputy. Why was it necessary for him to sit in Molotov's chair in May, but to hide behind his broad back in June?

On the evening of 22 June, the Soviet High Command issued a directive to the troops. It is Marshal G. K. Zhukov who speaks:

General N. F. Vatutin said that J. V. Stalin had approved draft directive No. 3 and ordered that my signature be placed on it ... 'All right,' I said. 'Put my signature down on it.' (G. K. Zhukov, *Vospominaniya i razmyshleniya*, APN 1969, P- 251)

We learn from official history that this directive emerged bearing the signatures of Marshal S. K. Timoshenko, People's Commissar for Defence, G. M. Malenkov, member of the council of the secretary of the Central Committee of the CPSU and General Zhukov, Chief of the General Staff. (*History of the Second World War*, Vol. 4, p. 38) Stalin thus compelled others to sign the order, while avoiding any personal responsibility for it himself. So why did he take on the responsibility in May? The directive went out to the armed forces to rout the invading enemy. It is a document of the utmost importance. What had the 'member of the council of the secretary' got to do with it?

The following day the composition of the Stavka, the supreme organ of military leadership in the Soviet Union, was announced. The word is untranslatable, but the Stavka consisted of Stalin and a handful of his most trusted colleagues. Stalin categorically refused to head it, agreeing to join this supreme body of military leadership with the rights of an ordinary member only. This gave rise to a somewhat anomalous situation:

Under the existing arrangements, there was no way in which S. K. Timoshenko, People's Commissar for Defence, could act independently and take policy decisions without Stalin. The result was that there were two commanders-in-chief. One was People's Commissar Timoshenko, who was the commander according to the law and statutes. The other was J. V. Stalin, who was commander-in-chief in fact. (*Ibid*)

In a defensive war, Stalin adapted his well-tried method of leadership. He took all the policy decisions, while responsibility for them was borne by the Molotovs, the Malenkovs, the Timoshenkos and the Zhukovs. It took the members of the Politburo one month to compel Stalin to take over the post of People's Commissar for Defence, and, on 8 August, the post of Supreme Commander-in-Chief. Had it really been worth Stalin's while to assume responsibility when the defensive war had been foreseen, in order to do everything he could to avoid responsibility as soon as that war began?

We are compelled to confine ourselves to the third option: that Stalin had exploited Hitler to crush Europe, and was at that point preparing a surprise attack at Germany's back. Stalin intended to head the 'liberation' of Europe in person, and as head of the Soviet government.

The Communist Party had conditioned the Soviet people and army to believe that the order to launch a war of 'liberation' in Europe would be given by Stalin himself. Communist orthodoxy now claims that the Red Army was preparing 'counterattacks'. Nobody was talking about counter-attacks at the time. The Soviet people knew that the war would begin on Stalin's orders, and not as a result of an attack by some enemy or other:

And when Marshal of the Revolution Comrade Stalin gives the signal, hundreds of thousands of pilots, navigators and parachutists will rain down upon the heads of the enemy with the full force of their arms, the arms of socialist justice. The Soviet armies of the air will bring happiness to humanity! (*Pravda*, 18 August 1940)

In his post as Secretary-General of the Party, Stalin could give any order, and that order would be instantly and exactly obeyed. But any order given by Stalin was unofficial, and therein lay Stalin's invulnerability and infallibility. But now this situation no longer satisfied him; he had to give an order, the most important of his life, in such a way that it would be *officially* his.

According to the evidence of Marshal of the Soviet Union K. K. Rokossovski (*Soldatsky dolg*, Moscow 1968, p. n), each Soviet commander held a 'special secret operations envelope' in his safe. This 'letter M red envelope', as it was known, could only be opened on the orders of the Chairman of the Council of People's Commissars (until 5 May 1941 this was Vyacheslav Molotov), or of the People's Commissar for Defence, Marshal of the Soviet Union, S. K. Timoshenko. But according to Marshal Zhukov, Timoshenko 'could not take any policy decisions without Stalin'. So Stalin took Molotov's post so that the Prime Order should come from Stalin, and not from Molotov.

A red envelope lay in the safe of every commander, but on 22 June 1941 Stalin issued no order that they be opened. Rokossovski has told us that several commanders took their heads in their hands and opened their envelopes. (The 58th Article laid down that anyone opening a red envelope without authorization would be shot.) But they did not discover in them anything needed for defence.

Of course, we had detailed plans and instructions on what to do on M-Day . . . Everything was written down minutely and in detail . . . All these plans existed. Unfortunately, however, they said nothing about what to do should the enemy suddenly go over to the offensive. (Major-General M. Gretsov, *VIZH* 1965, No. 9, p. 84)

So although the Soviet commanders did have war plans, they had no plans for a *defensive* war. The top Soviet leaders were aware of this; in the first minutes and hours of the war, they resorted to improvisation, composing new directives for the troops instead of sending a short message ordering the envelopes to be opened. In a defensive war, all these envelopes, and everything that had been 'written down minutely and in detail', were no longer needed.

Nor, by the way, did the first directives issued by the top Soviet leaders orientate the troops towards digging themselves in. These were neither defensive nor even counter-offensive directives. They were in essence purely offensive directives. The Soviet leaders went on thinking and planning only on these lines even after the defensive war had been thrust upon them. The content of the red envelopes was quite definite in nature. In an obscure situation the offensive urge of the troops had to be held back somewhat until it had become quite clear what was happening. That is why the first directives were aggressive in character, but their tone was restraining - advance, but not in the way it is written in the red envelopes!

Stalin did not want to take risks in an obscure situation. That is why Stalin's signature does not appear on the most important directives of the 'Great Motherland War'; he had prepared himself to carry out the honoured duty of launching a mission to liberate the peoples of the world, and not to fight a defensive war which had been forced upon him.

Hitler read Schulenburg's telegrams and understood that Stalin was hoping 'to attain an objective of the utmost importance by his own efforts in the field of foreign policy'. Hitler appreciated the danger he was in, and deprived Stalin of the opportunity to give the Prime Order, for which he had assumed the mantle of head of state.

On taking up his duties, each head of government announces a policy programme. On 5 May 1941, when Stalin's appointment had been pre-determined, he made a speech in the Kremlin at a reception held in honour of graduates of military academies. Stalin spoke for 40 minutes. Bearing in mind his impressive ability to keep silent, 40 minutes was a staggeringly long time.

Stalin spoke of something of the utmost importance. His speech was *never* published, and this is a one thousand per cent guarantee of its importance. Stalin spoke about international relations, and about war. Soviet official publications contain quite a few references to this speech:

J. V. Stalin, the Secretary-General of the CPSU (b), in the course of a speech he made at a reception for graduates of military academies on 5 May 1941, gave it clearly to be understood that the German Army was the most probable enemy. (*VIZH* No. 4 1978, p. 85)

The History of the Second World War (Vol. 3, p. 439) confirms this account. Marshal Zhukov, however, who is a much more authoritative source, relates some more interesting details. In Zhukov's words, Stalin adopted his usual manner of asking rhetorical questions, which he then answered himself. 'Was the German Army invincible?' he asked:

The Germans mistakenly consider that their army is perfect and invincible . . . Germany will never have success fighting under the slogans of aggressive wars of conquest, under slogans of subjugating other countries, or of forcing other countries and states into submission. (G. K. Zhukov, *Vospominaniya i razmyshleniya*, p. 236)

So the speech was about war with Germany. Why then did it remain secret? It is understandable that it could not be published before the war, but it is less easy to understand why the speech was not made public once war had broken out. Even if it had not been possible to publish it in its entirety, Stalin could have referred to it in the speech he made on 6 November 1941, for example: 'Did I not warn you all! I was even talking about war with Germany as early as 5 May!'

But Stalin did not say this, and there can only be one reason for this silence. On 5 May, he spoke of the inevitable war, and named Germany as the main enemy, but said not one word about the possibility of a German attack. Had he done so, he or his aides would have recalled it afterwards as confirmation of his

genius and sagacity. But they did not. Throughout Stalin's lifetime and even after his death, the speech remained a Soviet state secret. Collections of Stalin's works contain not just his speeches, but even the notes he made in the margins of books written by others, yet this highly important speech was never published. What is more, much has been done to make sure that it was forgotten for ever. Immediately after the war had ended, Stalin's book *The Great Motherland War* was published in editions of millions of copies in many languages. The book begins with Stalin's radio broadcast on 3 July 1941. The purpose of the book was clear. It was to hammer the idea into our heads that Stalin first began to speak about the Soviet—German war only after Germany had invaded the Soviet Union, and that he spoke only about defence. Stalin in fact began to talk about the war before the German invasion, not after it, and he spoke not about defence but about something else. If the speech had been about defence, then why keep it secret, particularly after the Germans had invaded?

We have already seen how, after the Molotov-Ribbentrop Pact had been signed, Zhukov and Meretskov, two prominent Soviet military leaders, and Lavrenty Beria, the most outstanding chief of police of all times and of all nations, did a great deal to destroy everything connected with the defence of Soviet territory. Then Stalin began to talk about war with Germany. He spoke at a secret gathering, but in such a way that he was heard by all the marshals, all the generals, and all the graduates from the military academies. What would Zhukov, Meretskov and Beria do in this situation? Surely they would begin to lay down mines in the frontier areas and, erect barbed wire, and mine bridges? No, they did just the opposite :

At the beginning of May 1941, following Stalin's speech at the reception for military academy graduates, the brake was applied even more strongly to all the work that was being done to build engineered defences and to lay down mines. (I. Stari-nov, *op. cit.*, p. 186)

If we do not believe Colonel Starinov, we may turn to the German archives to find exactly the same thing there. German intelligence apparently never obtained the full text of Stalin's speech, but there are many direct and indirect signs which indicate that German intelligence believed that Stalin's speech of 5 May 1941 was about war with Germany. The same German intelligence observed that Soviet minefields and other engineered defence obstacles were being removed in May and June 1941.

May 1941 marked a sharp turning-point for the whole of Soviet propaganda. Before that, communist newspapers had glorified war and rejoiced that Germany was destroying an increasing number of countries, governments, armies and political parties.

The Soviet leaders were delighted with 'modern war in all its terrible beauty!' (*Pravda*, 19 August 1940), and rubbed their hands gleefully over the sight of Europe reduced to 'a putrid scrap-heap, a pornographic spectacle where jackal eats jackal'. (*Pravda*, 25 December 1939) A friendly greetings telegram from Stalin 'To the Head of the German State, Herr Adolf Hitler' appears on the same page. The words jackal eats jackal' appeared directly under this token of friendship.

Then suddenly everything changed. The day after Stalin's secret speech, *Pravda* adopted a very different tone:

The fire of the Second Imperialist War blazes beyond the frontiers of our Motherland. The whole weight of its incalculable misfortunes is laid on the shoulders of the workers. The people do not want war. Their gazes are fixed on the countries of socialism which are reaping the fruits of peaceful labour. They see with every justification a solid bastion for peace in the armed forces of our Motherland, in the Red Army and Navy. In the present complex international situation it is necessary to be ready for surprises of all kinds . . . (*Pravda*, 6 May 1941, leading article)

In March 1939, Stalin had accused Britain and France of wanting to drive Europe into war, while they remained aloof so that they could later 'step on to the stage .with fresh forces, in the "interests of peace", of

course, and dictate their conditions to the weakened participants in the war'. (Stalin, Report, 10 March 1939) But only one leader was present at the signing of the pact which was the key to the war, and that was Stalin. Neither Japanese, American, British nor French leaders attended the signing of the pact which began the war. Even the German Chancellor was absent. But Stalin was there, and it was Stalin who for the time being stood aside from the war.

Shortly afterwards, on 17 September 1939, the Red Army delivered its surprise attack on Poland. Next day the Soviet Union announced its reasons by radio:

Poland has become a convenient springboard for hazards and surprises of all kinds which could constitute a threat to the Soviet Union . . . the Soviet government can no longer remain indifferent towards these facts ... in view of such circumstances, the Soviet government has directed the High Command of the Red Army to order its troops to cross the frontier and to take into its protection the lives and property of the populace . . . (*Pravda*, 18 September 1939)

But who, it might be asked, turned Poland into a 'convenient springboard for hazards of all kinds?' Molotov's and Stalin's cynicism and effrontery knew no bounds. Hitler went into Poland in order 'to extend *Lebensraum* for the Germans'. Molotov had a different purpose: 'in order to help the Polish people out of an ill-starred war into which they have been driven by foolish leaders, and to give them the opportunity to lead a peaceful life'. (*Ibid.*)

But Soviet communists even to the present day have not changed their view on the nature of these events. The official collection of documents on the History of Soviet Frontier Troops (*Pogranichnye voiska SSSR 1939-41*, Moscow Nauka) was published in 1970. Document No. 192 states that the aim of Soviet operations in September 1939 was to 'help the Polish people to leave the war'.

The Soviet Union has always helped everyone altruistically to find the way to peace. Molotov signed a neutrality pact with Japan on 13 April 1941

to uphold peaceful and friendly relations, and mutually to respect territorial integrity and inviolability ... in the event of one of the Parties to the treaty becoming the object of hostilities on the part of one or several third powers, the other Party to the treaty will remain neutral throughout the whole of the conflict.

When Stalin was on the verge of being destroyed, Japan kept its word. But when Japan was on the verge of destruction, the Red Army delivered a crushing surprise attack on her. Afterwards the Soviet government explained that such a policy is the only means capable of bringing peace nearer, of freeing the peoples from further sacrifices and sufferings and to give the Japanese people the opportunity to save itself from further dangers and destruction . . . (Soviet government statement, 8 August 1945)

It must be noted that the declaration was formally made on 8 August, while the Soviet troops delivered their blow on 9 August. In practice, there was a time-gap. The attack was made at local Far East time. The announcement was actually made several hours later at Moscow time.

In military language this is called 'preparation and delivery of a surprise first strike with the opening of a new strategic front'. (General S. P. Ivanov, *Nachal'nyi Period Viony*, Moscow Voen-izdat 1974, p. 281) In political language it is called 'a just and humane act by the USSR'. (Colonel A. S. Savin, *VIZH* 1985, No. 8, p. 56)

After the first crushing strike had been delivered, Marshal of the Soviet Union P. Ya Malinovsky addressed his troops, saying that

The Soviet people cannot live and work in peace while the Japanese imperialists are rattling their arms on our far eastern frontiers while awaiting the right time to attack our Motherland. (*Kommunist*, No. 12, 1985, p. 85)

Malinovsky gave this speech on 10 August 1945, just four days after Hiroshima had disappeared. Did the 'Japanese imperialists' really have nothing to do but sit and wait for 'the right time'?

Modern Soviet publications still insist that 'the Soviet Union was pursuing the aim of saving the peoples of Asia, the Japanese people included, from further sacrifices and suffering'. (VIZH 1985, No. 8)

In May 1941 the Soviet press suddenly began to talk about how the peoples of Europe wanted peace and were looking with hope to the Red Army. These were the same words and tone which were invariably used before every communist 'liberation'.

The Great Purge in the Soviet Union was completed at the end of 1938. A new stage began. There were new times, new aims and new slogans. It was in March 1939 that Stalin first began to talk about the need to be ready for some 'surprises', not inside the country but in the international arena. In August 1939 Stalin presented the first surprise, the first 'unexpected event' for which the whole of the Soviet people and indeed the whole world were sighing - the Molotov-Ribbentrop Pact. Thereupon German troops, quickly followed by Soviet troops, invaded Poland. The official Soviet explanation is that 'Poland had been converted into a field of various unexpected events'. Once this threat had been removed by the unselfish action of the Soviet government, the Red Army and the NKVD, Stalin began calling for readiness to meet 'new unexpected events', since 'the international situation is becoming increasingly complicated'.

It would seem that there was nothing more simple; peace had been signed with Germany, so where was the complexity in the situation? But Stalin went on repeating his warning not to have faith in the apparent lack of complications, to be ready to face unexpected events and any sharp turns and changes.

May 1941 was the month when the slogan 'Be ready for unexpected events' suddenly sounded throughout the country like an alarm bell. It sounded on the first day of May from the front page of *Pravda* and was repeated a thousand times over by all other newspapers, and by hundreds of thousands of voices of commissars, political workers, and propagandists, all interpreting Stalin's slogan for the masses. The call 'to be ready for unexpected events' resounded in the order No. 191 of the People's Commissar for Defence issued to 'all companies, batteries, squadrons, air squadrons and on ships'.

Was Stalin perhaps warning the country and army of the possibility of a sudden German attack? No; the German attack came as a complete surprise to Stalin himself; and he could hardly have given warnings about dangers which he did not foresee. All talk about unexpected events ceased on 22 June 1941, and this slogan was never repeated again. Contemporary Soviet publications contain no mention at all of the slogan 'prepare for unexpected events', although this was one of the most strident motifs of Soviet propaganda during the 'pre-war period'.

At first glance it is surprising that Stalin himself never subsequently remembered his slogan. He could have said somewhere, 'Hitler has suddenly attacked us - I warned you to be ready for unexpected events!' But Stalin never said this. 'Remember Order No. 191?' Marshal Timoshenko could have recollected on occasion after the war. 'I even warned you about it in that order!' Soviet historians and Party bureaucrats could have explained what a wise Party we had even without naming Stalin and Timoshenko. The pages of its main newspaper carried calls almost every day to be ready for unexpected events. But neither Stalin, nor Timoshenko, nor anyone else ever recalled that alarm cry of May and June 1941. Why was that? Because what was understood by the slogan 'prepare for unexpected events' was not the German invasion, but something quite the opposite. Under this slogan the Chekists were removing minefields on the frontiers, not laying them down, and they knew that this was preparation for the Central Unexpected Event of the twentieth century.

In order to have an idea of the true meaning of this slogan, we must without fail look at the first page of *Pravda* of 1 May 1941. It was this page which set the tone for a great choir of many voices, which simply repeated *Pravda's* statement. On the main front page of the newspaper, two quotations stand out. Both are Stalin's. The first, which comes right at the beginning of the leading article, states that 'what has been accomplished in the USSR can also be accomplished in other countries'. The second is in an order from the People's Commissar for Defence about the need to be ready to face up to hazards and 'tricks' on the part of our foreign enemies.

Everything else on the front page is about the brutal war gripping Europe, the sufferings of the workers, their longing for peace and the hopes they place in the Red Army. Much is said about Soviet efforts to preserve peace. Japan (whose hour had not yet struck) is given as an example of a neighbour, with whom good relations had finally been established; Germany, however, is not numbered among the good friends.

Since the enemy is cunning and perfidious, the argument runs, we must reply to his machinations not simply by defending our own territory but by liberating the peoples of Europe from the disasters of a blood-letting war.

After five days of this noisy, orchestrated press campaign, Stalin took over the post of head of the government and made his secret speech in which he named Germany as the main enemy. Having thus assumed state responsibility for foreseeing 'unexpected events', Stalin was suddenly faced with Hitler's onslaught in June. This was such an 'unexpected event' that it compelled Stalin to do everything possible to avoid assuming responsibility for any state decisions at all. Evidently Stalin had been preparing, not for a German invasion, but for 'unexpected events' of quite the opposite kind.

CHAPTER 20

Words and Actions

Words do not always match actions.

MOLOTOV (in conversation with Hitler, 13
November 1940)

In the best-known fragment of his secret speech of 5 May 1941, Stalin said that 'the war with Germany will not begin before 1942'. From the vantage point of what we know today, Stalin's mistake is obvious.

But let us not be too quick to mock Stalin's errors. If the speech was secret, then Stalin surely wanted to conceal its contents from the enemy. In the Kremlin, however, Stalin was heard by all the lecturers and graduates from all the military academies, as well as by the country's highest political leaders and the most senior Red Army officers. What is more, the content of his speech was passed on to all Soviet generals and colonels. 'In the middle of May 1941,' wrote Major-General B. Tramm,

Air Force Major-General P. P. Kobelev, chairman of the Central Council of OSOAVIAKHIM (Society for the Defence of the Soviet Union and for the Development of its Aviation and Chemical Industries), gathered together the senior staff of the Council, and reported to us the basic points of the speech made by J. V. Stalin at the government reception held in the Kremlin in honour of graduates from the military academies. (*VIZH* 1980, No. 6, p. 52)

Despite the supposed secrecy of Stalin's speech, thousands of people knew its content. Is there an explanation for such a paradox? Indeed there is. We know from the memoirs of Admiral of the Fleet of the Soviet Union I. G. Kuznetsov that after Zhukov had been appointed Chief of the General Staff, a very important directive was written which 'aimed the attention of the general officers commanding military

districts and fleets at Germany as the most probable enemy in the forthcoming war'. (*Nakanune*, Moscow Voenizdat 1966, p. 313)

The directive lay in the General Staff building for two months, and on 5 May 1941 it was passed on to the headquarters of the frontier military districts for action. There is much to indicate that it was received by the headquarters on the day it had been sent. Marshal Bagramyan, for instance, has spoken about it. In fact Soviet marshals often talk about this highly secret directive, although they never make quotations from it. In the course of half a century, only one single sentence from this top secret document has ever got into the press, and this was 'to be ready, on the orders of the High Command, to deliver swift blows utterly to destroy the enemy, to carry out combat operations over his territory and seize important positions'. (V. A. *Anfilov*, *Bessermertnyii podvig*, Moscow Nauka 1971, p. 171)

Had there been one word about defence in that directive, the marshals and the communist historians would not have failed to quote it. The whole of the remaining text of the 5 May directive is not, however, suitable for quotation. The directive is to remain top secret even half a century after the war has ended.

Soviet censorship let slip only one sentence, but this was enough to reveal fully the sense of this carefully concealed document. In a defensive war, a soldier does not wait for orders. For hundreds of years the Russian soldier has gone in to do battle with aggressors without waiting for orders from above. When the enemy crosses the river marking the frontier, that means to the ordinary soldier that the war has begun. The frontiers of Russia have been crossed by great armies of terrifying conquerors. Every time that this has happened, the Russian soldier, like the soldier of any other country and nation, has known from time immemorial that when the enemy crosses the frontier it means war, and he goes into action without awaiting orders to do so. Guard-duty service has been devised in such a way that it frequently places every soldier in a situation where he has to make his own independent decision as to when he should use his weapons. The right and duty of a soldier is to kill anyone who tries to reach the target he is protecting. Soviet law especially preserves the right of each soldier to use his weapons independently. The same law severely punishes any soldier who does not use his arms when the situation demands that he do so.

A soldier on a state frontier is a soldier at an action station. In a defensive war he needs neither orders nor directives.

A defensive war would usually begin like this. A soldier who has been freezing all night is getting ready to wrap himself up in his greatcoat and stand down. He gives his relief a wakening prod with his foot, but suddenly rubs his eyes - enemy soldiers are crossing the river. The soldier opens rapid fire, killing the leading enemy soldiers and warning his own comrades. The commander of the detachment wakes up, swears while still half-awake and, grasping what is happening, chases his other soldiers into the trenches. By then, fighting has flared up along thousands of kilometres of frontier. The platoon commander comes on the scene. He co-ordinates the fire of his detachments. Then other commanders of more senior rank turn up. The fighting becomes more organized. A report flies off to regimental headquarters, and from there to the divisional headquarters.

That is how a defensive war begins. Yet the top-secret directive of 5 May 1941 provided for millions of Red Army soldiers to enter the war in response to a single order which was to be received from the Soviet High Command. A half-asleep soldier on the frontier can see the enemy making an attack, but how can the comrades in the Kremlin know that a war has started? Unless, perhaps, they themselves had fixed the date on which it was to begin.

The first to enter a defensive war is the private soldier, folio wed by the sergeant, and then the platoon commander. In an offensive war, everything is the other way round. The first to enter it is the Commander-in-Chief, and then the Chief of the General Staff, followed by the commanders of the fronts, the navies and the armies. The ordinary soldier is the last to know that an aggressive war has begun. Millions of soldiers enter a defensive war individually, while they all enter an aggressive war as one man.

Hitler's soldiers entered enemy territory as one man, minute by minute, hour by hour. Stalin's soldiers also did the same thing in Finland, in Mongolia and in Bessarabia. That was the way in which they were to have gone to war with Germany.

The 5 May directive was issued, but the date when the war was due to begin was kept a close secret. Await the signal and be ready at any moment, the directive told the Soviet generals. Once he had issued this directive, Stalin immediately took over the post of head of the Soviet government so that he personally would give the signal for the directive to be carried into effect.

Hitler gave his own troops the order to carry out a similar directive a little earlier . . .

Icebreaker in action: the Germans destroyed Poland, but the flower of victory was gathered by the Soviets.

These Soviet tanks, with removable external tracks, were designed for use on the German *autobahn*. They were of no use on Soviet territory thus equipped.

The vast sums of money spent on training and equipping Soviet parashutists during the thirties should have been used to feed Soviet children.

Winged tank KT, alias A-40 (Antonov-40), in the air. Pilot S. Anokhin at the controls. Taken from *Soviet Tanks and Combat Vehicles of World War Two* by Steven J. Zaloga and James Gradden, Arms and Armour Press, London (1984).

KT/A-40, drawn by John W. Wood. Taken from *Tanks and other Armoured Fighting Vehicles* by B. T. White, Blandford Press, Dorset (1975). The German invasion rendered this type

At the start of the Second World War, Stalin had more parashutists than all the other countries put together. Parashutists, by definition, can only be used in an offensive war.

Invasion preparations. The two-seater plane R-5 could also carry sixteen parachutists.

Genghis Khan conquered the world with huge numbers of scantily armed troops and brilliant manoeuvres, rather than with powerful weapons. The BT Soviet tanks were based on similar principles: they were produced in vast quantities with reduced armour, and were capable of exceptional speed.

Переправа тяжелого орудия на учениях. Ленинградский военный округ, 1940 г.

Переправа танков на тактических занятиях. 1940 г.

In 1940–41 Stalin created 63 tank divisions, each with bridge-building capabilities, but without the engineers, trained to blow up bridges, who are necessary in a defensive war. *Top:* Crossing a river. Exercise in Leningrad military region. *Bottom:* Tanks crossing a river. Tactical exercise.

Final preparations:
Marshal Timonshenko
and Marshal Zhukov
on the German
border.

In a defensive war,
troops are scattered
and camouflaged.
When the Germans
came to Soviet
territory, they found
an incredible
concentration of
Soviet troops ready
for an offensive.

The KV-1, the most powerful tank of the time. It sometimes took thirty or forty direct hits for German shells to make an impact. But like the majority of Soviet armed vehicles and equipment, these tanks were moving secretly by rail to the German borders and were powerless when attacked.

Before Hitler attacked, Stalin took hundreds of thousands of GULAG prisoners and secretly moved them towards the German borders. To what purpose?

We do not know, and apparently we shall never find out, what the top-secret directive of 5 May 1941 contained. It is clear, however, that it was a directive about a war with Germany, but a war which was not to be started by a German invasion, but by some other means. If the directive had had several alternative versions, and one of those had covered the contingency of Germany starting the war, then all the Soviet leaders in the Kremlin need then have done on 22 June 1941 was to telephone the officers commanding the frontier military districts and tell them, 'Open your safes, take out the directive dated 5 May and carry out what it says.'

If the 5 May directive had contained several alternative sets of orders, and one of them had been defensive, then the officer commanding the frontier military district could have been told, 'Put a line through the first nine versions, but carry out the tenth, the final one.' *But there were no defensive versions in the directive.*

That is why the directive of 5 May was never put into effect. The Soviet directive completely lost its point the moment the Germans invaded. It became instantly outdated, in the same way that all Soviet motorway tanks became obsolete.

Since the directive was now useless, the Soviet leaders in the Kremlin were compelled to improvise. Timoshenko and Malenkov were obliged to waste time composing a completely new directive. Then more time had to be wasted enciphering it, transmitting it, receiving it, and deciphering it. The 22 June directive, incidentally, was a thoroughly aggressive document. But it slightly dampened down the offensive urge of the Soviet troops.

It must not be thought that all the copies of the 5 May directives had simply lain in the safes, waiting for the hour to come to use them. The directive had been issued to be executed, and in accordance with its instructions, troops were regrouped on a grand scale on the borders. In the frontier areas, hundreds of kilometres of barbed-wire entanglements and thousands of mines were removed. Hundreds of thousands

of tons of ammunition were moved right up to the frontier and stockpiled in the open. Hundreds of thousands of tons of stores of all kinds, needed for a swift and unavoidable war, were brought into the frontier areas.

On 15 June 1941, the time came for the generals in command of armies, corps and divisions to learn more about the Soviet leaders' intentions. That day, the headquarters of the five frontier military districts issued combat orders which had been written on the basis of the top-secret 5 May directive. The circle of the initiated now extended to several hundred men. The orders issued on 15 June 1941 to middle-rank commanders in the Red Army also remained top secret, but there were several of these, so they are quoted more fully and more often. The operative sentence from the order issued on 15 June 1941 by the headquarters of the Baltic Special Military District to the officers commanding its armies and corps is well known to historians: 'We must be ready at any time to carry out the combat mission.'

Now let us return to Stalin's secret speech of 5 May 1941. In a *secret* speech to a full auditorium, Stalin spoke of the aggressive war against Germany, which would begin in 1942. On the very same day, in a *top secret* directive, the officers commanding the frontier military districts were instructed to be ready for aggression at any moment.

There is another coincidence. On 13 June 1941, TASS transmitted a report which said that the Soviet Union did not intend to attack Germany. It was moving troops up to the German borders solely for exercise purposes. Yet two days later, on 15 June, the Soviet generals in the frontier military districts received an order which was strictly for their eyes alone — to be ready at any moment to seize positions on foreign territory.

By May and June of 1941, Stalin knew that it was no longer possible to hide the preparations which the Soviet Union was making to 'liberate' Europe. That was why he 'naively' declared to the whole world in the TASS report that the Soviet Union was not preparing to make an attack. Naturally, German intelligence did not believe such a crudely forged document, and it was with this in mind that Stalin 'secretly' informed thousands of his officers, and German intelligence at the same time, that the Soviet Union would attack Germany in 1942.

Although it was no longer possible for Stalin to conceal his intentions, it *was* possible to conceal the date. This is just what Stalin's 'secret' speech was calculated to achieve. If Hitler did not believe Stalin's overt statements, the theory went, then maybe he would fall for his 'secret' one. Hitler had enough sense to believe neither.

CHAPTER 21

Living Peaceably with Sharp Teeth

*The enemy must be caught unawares, and the time
chosen when his troops are scattered.*

STALIN (Vol. 6, p. 158)

On 8 May 1941, two days after Stalin's 'secret' speech, TASS broadcast a vigorous denial of a Japanese press-agency report of massive Soviet troop movements:

Japanese newspapers are publishing reports issued by the Domei Tsusin Agency in which it states that the Soviet Union is concentrating strong military forces on its western frontiers ... In this connection, passenger traffic along the Trans-Siberian Railway has been stopped, so that troops from the Far East can be transferred mainly to its western frontiers. Strong military forces are also being transferred there from central Asia ... A military mission headed by Kuznetsov has left Moscow for Tehran. The purpose of the mission, the Agency notes, is connected with the granting of airfields to the Soviet Union in central and western areas of Iran.

TASS is authorized to state that this suspiciously strident Domei Tsusin report, borrowed from some unknown United Press correspondent, is the fruit of the sick imagination of its authors . . . There is no 'concentration of strong military forces on the western frontiers of the USSR, nor are any envisaged. The Domei Tsusin report contained one grain of truth, which moreover is given out in a crudely distorted form, and this is that one rifle division is being transferred from the Irkutsk area to near Novosibirsk, because there are better billeting conditions in Novosibirsk. Everything else contained in the Domei Tsusin report is sheer fantasy.

Through their American sources, the Japanese newspapers accurately forecast events. Three months later, Soviet troops went into Iran and built not only airfields, but much else besides. Domei Tsusin's reference to 'troop concentrations on an exceptionally large scale' was correct: in addition to other forces, Stalin concentrated 20 mechanized corps and five airborne assault corps on the borders with Germany.

TASS spoke of one rifle division being sent 'from Irkutsk to Novosibirsk'. Let us hear other witnesses. Lieutenant-General G. Shelakhov was a major-general at the time, and Chief of Staff of the 1st Army of the Red Banner on the Eastern Front. 'According to a directive from the People's Commissariat for Defence of 16 April 1941,' he wrote, 'the headquarters of the 18th and 3rd Rifle Corps, the 21st and 66th Rifle Divisions, the 21st and the 212th Airborne Assault Brigades and several special purpose units were moved from the complement of the Far Eastern Front to the west of the country.' (*VIZH*, 1969, No. 3, p. 56)

The transfer of airborne assault brigades to reinforce the five already in the western areas of the country is evidence that an offensive operation on a massive scale was being prepared. The bogus TASS 'denial' lent secrecy to the operation, in order that it would take the enemy by surprise.

The 212nd Airborne Assault Brigade was Marshal Zhukov's favourite. In August 1939, it was serving along with the OSN AZ battalion of the NK VD in Zhukov's personal reserve; when he launched his crushing surprise attack against the Japanese, the brigade was used as crack infantry in the strike which hit at the rear of the Japanese 6th Army.

Zhukov then secretly transferred this, the best brigade in the Red Army, from the Far East to join the complement of the 3rd Airborne Assault Corps on the Romanian frontier. Hitler did not allow this brigade — or any of the massive concentration of Soviet troops on the western border—to be used for their intended purposes. Operation Barbarossa forced the Soviet Union onto the defensive, and the 3rd Airborne Assault Corps was no longer needed. It was then re-formed into the 87th Rifle Division (later to become the 13th Guards Division), and distinguished itself in defensive fighting.

We can follow the secret movement of these troops from the Far East through many sources. Both Marshals Zhukov and I. Kh. Bagramyan confirm that the 31st Rifle Corps arrived in the Kiev Special Military District on 25 May 1941. This means that when the TASS 'denial' was issued, the 31st Rifle Corps was somewhere on the Trans-Siberian Railway. Colonel-General I. Lyudnikov states that, after he had set up, mobilized and then

taken over command of the 200th Rifle Division, he was ordered to join the complement of the 31st Rifle Corps. Then, like all its numerous brothers-in-arms, this corps was secretly moved right up to the German frontier. But Hitler did not allow the 31st Rifle Corps to complete the journey which it had begun.

Anyone who wishes to do so may re-trace the routes which these other corps, divisions and brigades took when they were secretly transferred from the Far East, by referring to the many recollections published by Soviet marshals and generals; to evidence from Soviet soldiers who were transferred from the Far East and who, on finding themselves on the German and Romanian borders on 22 July, became prisoners of war; to German intelligence reports, and to many other sources.

The TASS denial mentioned a rifle division which was transferred from Irkutsk to Novosibirsk because the billeting conditions there were better. For many years now I have been unsuccessfully searching for some trace of this mysterious division. I have found nothing; but in the process, I have turned up a mass of information about other divisions; in Irkutsk and Novosibirsk, in Chita and Ulan Ude, in Blagoveshchensk and Spassk, in Iman and Barabash, in Khabarovsk and Voroshilov. All of them entrained, not simply to off-load in a neighbouring town a few hundred kilometres up the line, but to disembark at the western frontiers. An official history, which was in fact published in Irkutsk (*Zabailkal'sky voennyi okrug*, Irkutsk 1972), tells of many divisions being loaded on trains, all headed for the western borders. The 57th Tank Division, commanded by Colonel V. A. Mishulin, secretly entrained here in April. Mishulin had no idea for what purpose. From Irkutsk it was conveyed to the Kiev Special Military District, and was ordered to off-load near Shepetovka.

Meanwhile the flow of troops along the Trans-Siberian Railway (and along all other main lines) was growing. We know that corps from the Far East began to de-train in the Ukraine on 25 May 1941: the 31st Rifle Corps, for example, off-loaded near Zhitomir. The following day, the officer commanding the Urals Military District was ordered to transfer two rifle divisions to the Baltic. (Major-General A. Grylev and Professor V. Khvostov, *Kommunist*, 1968, No. 12, p. 67) That same day, the Trans-Baikal Military District and the Far Eastern Front were ordered to prepare to send a further nine divisions, including three tank divisions, to the western part of the country. (*Ibid*) The 16th Army was already on the Trans-Siberian Railway; the 22nd and the 24th Armies were heading towards it.

The greatest falsehood in the TASS 'denial' was not about 'billeting conditions', however, but about the concentration of troops on the western border. 'There is no concentration,' it stated, '*and none is foreseen.*' That was the most important point. First, the concentration was there, and the German invasion confirmed that it exceeded even the most daring forecasts. Secondly, while all these brigades, divisions and corps were being transferred, plans were being laid for an even greater and truly unprecedented railway operation, namely the transfer by rail of the Second Strategic Echelon of the Red Army. The directive ordering the officers commanding the troops to begin the transfer of this echelon was given on 13 May. The TASS 'denial' was published while this was being set up.

Major-General A. A. Lobachev, who was a member of the Military Council of the 16th Army at the time, recalled the events of 26 May 1941:

The Chief of Staff reported that an important enciphered message concerning the 16th Army had arrived from Moscow . . . this order required that the 16th Army be redeployed to a new location. M. F. Lukin had to report immediately to the General Staff to be given instructions, while Colonel M. A. Shalin and myself had to arrange to send off the military trains.

'Where to?' I asked Kurochkin.

'Westwards.'

We took advice and decided to send the tank crews first, then the 152nd Division and the remaining formations, and finally the army headquarters and the units appended to it.

'Send the trains by night. No one must know that the army is leaving,' the Officer Commanding warned.

By the time the trains carrying the tanks had left, Kurochkin and Zimin arrived, gathered together the command personnel of the 5th Corps, and expressed the wish to General Alekseenko and to all the commanders that they would not let down the Trans-Baikal traditions . . . The men listened to these warm parting words, and everybody thought not so much about military training, but that the subject might

shortly become one of military action. (General A. A. Loba-chev, *Tmdnymi Dorogami*, Moscow Voenizdat 1960, p. 123)

General Lobachev was to relate some surprising things later. General Lukin, the officer commanding the 16th Army, Lobachev himself, and Colonel M. A. Shalin, the 16th Army Chief of Staff and future head of the GRU, all knew that the 16th Army was being transferred westwards, but they did not know exactly where. All the other generals in the 16th Army were 'secretly' informed that the army's destination was the Iranian frontier. The less senior officers on the command staff were told that the purpose of the displacement was training exercises, while the wives of the officers were told that the army was off to camp.

In a defensive war, there is no need to deceive the generals in this way. In the German Army, the same thing was being done at the same time, when disinformation was being spread about Operation Sea Lion. It is a sure sign that a surprise attack is in preparation when the troops are deliberately deceived about where operations are going to take place. In order to dissemble from the enemy, one must also dissemble from one's own troops. Aggressors have always done this: Hitler did it, and so did Stalin.

It is interesting that in April 1941, everybody broadly understood that the 16th Army was going off to war:

'Are you going off to fight,' Lobachev's wife asked him point-blank.

'Where did you get that from?'

'Come off it! I read the papers, don't I?'

(Ibid)

This was a highly interesting psychological moment. I have questioned hundreds of people who belonged to that generation, and they all had a presentiment that war was coming. I was amazed, and asked where these presentiments had come from. From the newspapers, they all replied.

We, people of today, seldom find direct evidence of an imminent and unavoidable war when we scan the yellowing newspaper pages of those years. Yet the people of that generation knew, by reading between the lines, that war was unavoidably approaching. Those people in Siberia could not have known about the preparations which Hitler was making; their feeling that war could not be avoided must have been based on Soviet preparations.

General Lobachev recalls the incredible degree of secrecy in which the army was transferred: the military trains only moving by night; trains which stopped at neither important stations nor at medium-sized ones; the transfer of the 16th Army headquarters in goods wagons with their doors and windows completely closed; the small stations where the trains halted, with no one allowed to leave the wagons. In those days a passenger train took more than eleven days and nights to cross the Trans-Siberian Railway, while goods trains took longer. Officers and men can be transported in completely closed wagons. But here we are talking about an army headquarters. Such a degree of secrecy is unusual even by Soviet standards. In 1945 a stream of troops was to flow back along the Trans-Siberian Railway in the opposite direction to take part in the surprise strike against Japanese troops in Manchuria and China. For purposes of concealment, all generals travelled in officers' uniforms which had far fewer stars on their shoulder-straps than their ranks entitled them to wear, but even so, they travelled in passenger wagons. Yet in 1941 the generals had travelled in goods wagons. Why?

CHAPTER 22

The TASS Report

*Stalin was not one of those figures whose
real intentions were ever openly declared.*

ROBERT CONQUEST

(The Great Terror, London, 1968)

On 13 June 1941, Moscow Radio broadcast an unusual and puzzling report from TASS. It claimed that 'like the Soviet Union, Germany is also steadfastly observing the conditions of the Soviet—German non-aggression pact . . .' and that 'these rumours [of a German attack on the Soviet Union] are propaganda clumsily concocted by forces which are hostile to the Soviet Union and Germany, and which are interested in further extending and developing the war . . .' The main Soviet newspapers published this report the next day. Yet within the week, Germany had attacked the Soviet Union.

Everybody knew who had written the TASS report. Stalin's characteristic style was recognized by generals serving in the various Soviet headquarters, by GULAG prisoners, and by Western experts. Although Stalin purged TASS after the war, none of the leading figures in this institution were ever accused of having spread reports which could have been considered 'manifestly harmful'. Stalin could also have put the blame for broadcasting the TASS report onto any member of the Politburo, but he did not do this either; he took the entire responsibility for it himself.

Much has been written about this TASS report in both the foreign and the Soviet press. Everyone who has dealt with the subject has laughed at Stalin's touching naivety. The TASS report, however, is not so much amusing as mysterious and incomprehensible. Only one thing is clear: the identity of its author. All the rest is an enigma.

The TASS report appears to contradict everything we know about Stalin's character. Boris Bazhanov, who was Stalin's personal secretary and knew him better than anyone, describes him as 'secretive and cunning in

the extreme . . . He possessed the gift of silence to a high degree, and in this he was unique in a country where everyone talks too much.'

Many writers have testified to Stalin's taciturnity: 'He was an irreconcilable enemy of verbal inflation, or garrulousness,' wrote Abdurachman Avtokhranov. 'Don't say what you think, and don't think what you say, could be another motto for his life.' Robert Conquest, a prominent researcher into the Stalin period, has observed that 'we still have to peer through the darkness of Stalin's exceptional secretiveness', and that 'Stalin never said what was on his mind, even when speaking about his political aims'. (*The Great Terror*)

The ability to keep silent, in Dale Carnegie's apt words, is the most rarely found talent of all in human beings. From this viewpoint Stalin was a genius. Nor was this only a very strong trait in his character; it also served as a very strong weapon in dispute. He lulled his enemies with his silence, so that the suddenness of his blows made them irresistible. Why then did Stalin suddenly publicize his thoughts about relations with Germany in a Radio Moscow broadcast? Where was his secretiveness and cunning then? If Stalin had any thoughts about how future events would develop, why did he not discuss them in the close circle of his comrades-in-arms? Who passes important messages to his army through the radio station of the capital and the main newspapers? The army, navy, secret police, concentration camps, industry, transport, agriculture, and the entire population of the Soviet Union formed part of the state system. They were all subordinated, not to newspaper reports, but to their superiors, who in turn received orders through special, often secret channels from their chiefs. Stalin's empire was centralized like no other and, particularly after the Great Purge, the mechanism of state government was built in such a way that any order was immediately transmitted from the highest level down to the lowest functionaries, who rigorously carried it out. The large-scale operations in 1939 involving the arrest and elimination of Yezhov's supporters, and the actual replacement of the entire directorate of the secret police, were carried out quickly and effectively, in such a way that no one outside ever decoded the signal to begin the operations, or knew how or when Stalin gave the signal to set them in motion.

If Stalin, in June 1941, had had ideas to put before millions of functionaries without delay, why did he not avail himself of that smooth machine of government, which would transmit any order immediately and without distortion? If it were a statement of some gravity, it could be duplicated on secret channels. The TASS report, according to Marshal of the Soviet Union A. M. Vasilevsky, 'was not followed by any new policy

instructions about the armed forces, or by any review of previously taken decisions'. (A. M. Vasilevsky: *Delo Vsei Zhizni*, Moscow IPL 1973, p. 120). The Marshal goes on to say that it changed nothing in the work of the General Staffer of the People's Commissariat for Defence. Indeed, 'it was essential that nothing should change'.

No confirmation of the TASS report was sent along secret military channels. On the contrary, there are documents which show that, at the same time as the TASS report was published, an order was given to the troops in the military districts, including the Baltic Special Military District, which in both sense and spirit was directly contrary to the TASS report. (Archiv MO SSSR, Archive 344, schedule 2459, item n, p. 31) The material published in military newspapers, especially those which are unavailable to outsiders, was also in direct conflict to the content of the TASS report. (See for example Vice-Admiral I. I. Azarov; *Osazhdennaya Odessa*, Moscow Voenizdat)

The TASS report was not only out of keeping with Stalin's character; it did not tally with the central idea of all communist mythology. Throughout his entire life, any communist tyrant, and especially Stalin, constantly repeats a simple and eminently comprehensible sentence: 'The enemy is watching.' This magic sentence explains the absence of meat in the shops, the 'liberation campaigns', censorship, torture, mass purges and closed frontiers. Phrases like 'the enemy is on the watch' and 'we are surrounded by enemies' are not just ideology; they are the sharpest weapon the Party has. This weapon destroyed all forms of opposition. Yet once, and only once in the history of all communist regimes, the head of the most powerful of them all told the whole world that the threat of aggression did not exist.

13 June 1941 was one of the most important dates in Soviet history. Its significance is considerably greater than that of 22 June 1941, and Soviet generals, admirals and marshals describe this date in their memoirs in far more detail. 'On 13 June 1941,' wrote Lieutenant-General N. I. Biryukov, who at the time was a major-general in command of the 186th Rifle Division belonging to the 62nd Rifle Corps in the Urals Military District, 'the Military District headquarters sent us a directive of special importance, which ordered the division to leave for a "new camp". The address of the new quartering was not even communicated to me, the

commander of the division. I only learnt on a trip to Moscow that our division was to be concentrated in the woods to the west of Idritsa.' (*VIZH* 1962, No. 4, p. 80)

In peacetime, a division holds secret and sometimes top-secret documents. A document graded 'of special importance', however, can be sent to a division only in wartime, and only in exceptional circumstances where operations of extreme importance are being planned. Many Soviet divisions passed through the war without ever holding even one document with this highest secrecy grading. The fact that Biryukov chose to put inverted commas around the words 'new camp' is also significant.

The 186th Division was not the only one in the Urals Military District which received this order: *all* the divisions in the district received it. The official history of the district (*Krasnoznamennyi Ural'sky*, Moscow Voenizdat 1983, p. 104) records how 'the loading began of the 112th Rifle Division. The military train left the small railway station on the morning of 13 June . . . Other military trains followed. Then the entrainment began of units belonging to the 98th, 153rd, and 186th Rifle Divisions.' The 170th and 174th Rifle Divisions, along with artillery, sapper, anti-aircraft and other units were got ready for departure. Headquarters of the two corps were set up to handle the Urals divisions. These headquarters in turn came under the command of the headquarters of the new 22nd Army, whose commanding officer was Lieutenant-General F. A. Ershakov. Covered by the soothing TASS report, this great mass of headquarters and troops moved off secretly for the forests of Byelorussia.

The 22nd Army was not the only one on the move: 'Just before the war began, additional forces were assembled for posting in the strictest secrecy to the frontier districts. Five armies were moved westwards from the heart of the country.' (General S. M. Shtemenko, *General'nyi shtab v Gody Voyny*, Moscow Voenizdat 1968, p. 26)

General S. P. Ivanov adds that 'while this move was in progress, a further three armies were prepared for redeployment'. (*Nachal'nyi Period Voyny*, Moscow Voenizdat 1974, p. 211)

The question now arises as to why all eight armies did not move at the same time. The answer is simple. The large-scale secret transfer of Soviet troops westwards took place in March, April and May. The country's entire railway transport was involved in this vast secret operation. It was completed on time, but tens of thousands of wagons had to be sent back across thousands of kilometres of railway. Therefore on 13 June,

when another secret large-scale transfer of troops began, the armies found that there were not enough railway wagons available.

It is almost impossible to give the scale of these troop movements, as we do not have exact figures. Some idea of the size of the operation can be gathered from published accounts, however:

In May and early June, the transport system of the USSR had to move about 800,000 reservists . . . these movements had to take place secretly. (I. V. Kovalev, formerly Deputy People's Commissar for State Control, *Transport v Velikoi Otechestvennoi Voine*, Moscow Nauka 1981, p. 41)

In May ... an airborne assault corps was concentrated near Zhitomir and in the forests to the south-west of it. (Colonel-General I. I. Lyudnikov, *VIZH* 1961, No. 9, p. 66)

Marshal Bagramyan, based in the Kiev Special Military District at the time, later recalled how

The headquarters of the 31st Rifle Corps from the Far East was to arrive on 25 May to join the troop complement here ... in the second half of May the General Staff sent us a directive instructing us to accept the headquarters of the 34th Rifle Corps, four divisions, each with a strength of 12,000 and one mountain rifle division, all coming from the Northern Caucasus Military District . . . Almost a whole army had to be billeted in a very short space of time ... at the end of May, one military train after another began to arrive in the district. The operations branch changed into something resembling a movements office, into which all information flowed about the arriving troops. (*VIZH* 1967, No. I, p. 62)

The situation was very similar on 13 June, when another secret re-grouping of troops began. These were to form the Second Strategic Echelon of the Red Army. I now have information about 77 divisions and a very great number of regiments and battalions who had secretly begun to move westwards under cover of the TASS report.

Lieutenant-General of Artillery G. D. Plaskov, who was a colonel at the time, has given a vivid description of the events of that day:

The 53rd Division, in which I was officer in command of artillery, was deployed on the Volga. Our senior Command Staff were summoned to the headquarters of our 63rd Corps.

V. F. Gerasimenko, the commander of the District, came to the meeting. The arrival of the top brass put everyone on his guard, for it meant that something important was in the offing. A. G. Petrovsky, the corps commander, who was usually a quiet unruffled man, was noticeably agitated.

'Comrades,' he said. 'The corps has been ordered to mobilize fully. We must bring our units up to their full war-establishment strength, for which emergency reserves are to be used. We must call up our remaining reserve complement immediately. Major-General V. S. Bensky, the chief of staff of the corps, will give you the plan with the loading rota, the military trains available, and times of departure.'

The meeting did not last long. Everything was clear. And although General Gerasimenko hinted that we were going off on an exercise, everyone knew that the matter was much more serious than that. A full complement of combat equipment had never before been taken off on a training exercise. Nor were people called up from the reserve . . . (*Pod Grokhot Kanonady*, Moscow Voenizdat 1969, p. 125)

The First Strategic Echelon, meanwhile, which had entrained for the frontier regions earlier in the year, was being moved right up to the frontier itself. On 14 June the military council of the Odessa Military District was ordered to establish the headquarters of the 9th Army in Tiraspol (*VIZH* 1978, No. 4, p. 86), and the Military Council of the Baltic Special Military District ratified a plan to redeploy a number of divisions and detached regiments in the frontier area. (*Soviet Military Encyclopedia*, Moscow, Vol. 6, p. 517)

General S. P. Ivanov recalls that

while troops were being moved from the depth of the country, a covert regrouping began of formations inside the military districts on the frontier. Formations were moved nearer the frontier, under the guise of changing the locations of summer camps . . . Most formations were moved at night . . . (*Nachal'nyi Period Voyny*, Moscow Voenizdat 1974, p. 211)

Many other officers corroborate his account of these events. Major-General S. Iovlev, who was then commander of the 64th Rifle Division of the 1st Army's 44th Rifle Corps, wrote that 'on 15 June 1941 General D. G. Pavlov, the officer commanding the Western Special Military District, ordered the divisions in our corps to prepare to redeploy in full complement . . . We were not told where our destination was . . .' (*VIZH* 1960, No. 9, p. 56)

According to Colonel-General L. M. Sandalov, who was then a colonel and chief of staff of the 4th Army of the Western Special Military District, 'a new division, the 75th Rifle, appeared on the southern wing of the 4th Army. It had been moved up from Mozyr' and had put up heavily camouflaged tent encampments in the forests. (*Perezhitoe*, Moscow Voenizdat 1966, p. 71)

The official history of the Kiev Military District states that on 14 June, 'Major-General F. F. Alyabushev's 87th Rifle Division was moved up to the state frontier under the guise of exercises.' (*Kievsky Krasnoznamennyi*, Moscow Voenizdat 1974, p. 162)

The method of moving troops up to the frontier under the guise of exercises is not adopted on local initiative. Marshal Zhukov's recollections make it clear that the order came from above:

S. K. Timoshenko, the People's Commissar for Defence, recommended to the officers commanding the troops in the military districts that they have their formations carry out tactical exercises beside the state frontier so that, in accordance with the plan for cover, troops could be moved up nearer to their areas of deployment. The districts carried out this recommendation from the People's Commissar but with one vital

proviso - a significant part of the artillery did not take part in these movements. (G. K. Zhukov, *Vospominaniya i razmyshleniya*, Moscow APN 1969, p. 242)

Marshal of the Soviet Union K. K. Rokossovsky, then commander of the 9th Mechanized Corps, explains why the troops had moved up to the state frontier without artillery; the artillery had been ordered up to the frontier a short time before. (*Soldatsky Dolg*, Moscow Voenizdat 1968, p. 8)

According to Marshal Kirill Meretskov, then a general and Deputy People's Commissar for Defence, 'an exercise of the mechanized corps was carried out on my orders. The corps was brought up to the frontier area in training order, and it stayed there. I then said to Zakharov that Major-General R. Ya. Mali-novsky's corps was also in the district, and that it too had to be brought up to the frontier area during the exercises.' (*Na Slyzhbe Narodu*, Moscow IPL 1968, p. 204)

Marshal Rodion Malinovsky, then a major-general in command of the 48th Rifle Corps of the Odessa Military District, confirms that this order was carried out. 'As early as 7 June, the corps had left the Kirovograd area for Bel'tsy, and it was already in place by 14 June. This displacement was carried out under the guise of large-scale exercises.' (*VIZH* 1961, No. 6, p. 6)

Marshal Bagramyan has said that 'we had to prepare all the operational documentation needed for moving five rifle and four mechanized corps out of the areas where they were stationed permanently into the frontier zone'. (*Tak Nachinalas' Voina*, Moscow Voenizdat 1971, p. 64) 'On 15 June we were ordered to begin moving all five rifle corps to the frontier . . . They took with them everything necessary for combat operations. For the purposes of secrecy, these movements took place only at night.' (*Ibid*, p. 77)

Colonel-General I. I. Lyudnikov, then a colonel in command of the 200th Rifle Division of the 31st Rifle Corps, was one of those who carried out this order. 'The Military District's directive,' he recalled, 'which arrived in divisional headquarters on 16 June 1941, gave the order to set out on the march . . . with full complement . . . and to concentrate in the forest some 10-15 kilometres to the north-east of the frontier town of Kovel'. The order was that the move should be carried out covertly, and only by night, through forest-covered terrain.' (*Skvoz' Grozy*, Donetsk, Donbass, 1973, p. 24)

It was not only armies, corps and divisions that were moved to the state frontiers. There are hundreds of pieces of evidence to show that much smaller sub-units were also transferred there.

Lieutenant-General V. F. Zotov, for example, then a major-general and chief of the SZF (North-Western Front) engineering troops, reported that 'the sapper battalions were fully mobilized on a wartime footing . . . ten battalions which had come from the Far East were armed to the full'. (*Na Severo-Zapadnom Fronte*, Moscow Nauka 1969, p. 172)

Colonel S. F. Khvalei, then deputy commander of the 202nd Motorized Division of the 8th Army's I2th Mechanized Corps, stated that 'on the night of 18 June 1941, our division set out on field exercises'. (*Na Severo-Zapadnom Fronte*, Moscow Nauka 1969, p. 310) The colonel adds that by the time the war began, the sub-units of the divisions found themselves directly behind the frontier security detachments, in the immediate proximity of the state frontier.

A brief excerpt from the operational order issued on 18 June 1941 to Colonel I. D. Chernyakhovsky has been published in the Soviet Union. Chernyakhovsky, who was later to become a general of the army, was then the commander of the tank division of the same I2th Mechanized Corps.

On receipt of this order the Commander of the 28th Tank Division Colonel Chernyakhovsky is to bring all units to a state of combat preparedness in accordance with the battle alert plans, but the alert itself is not to be declared. Everything is to be carried out quickly, but noiselessly, without panic or careless talk, and the prescribed levels must be attained in both individual portable reserves and transportable reserves which will be needed for physical sustenance and battle . . . (*VIZH* 1986, No. 6, p. 75)

It is a great pity that the whole order was not published. It remains just as much a secret as it was half a century ago. According to captured German documents, their first encounter with the 28th Tank Division took place near Shaulya. But that division had been given the task of moving right up to the frontier itself.

Marshal of Armoured Tank Troops P. P. Polyboyarov, then a colonel and chief of the motorized armoured tank headquarters of the North-Western Front, stated that

'the division (the 28th Tank) had to leave Riga for a position on the Soviet—German frontier.' (*Na Severo-Zapadnom Fronte*, Moscow Nauka 1969, p. 114) The German invasion simply caught this division, like many others, on the way to the frontier.

In my private library there are sufficient documents on the movements of troops towards the frontiers to fill several voluminous books. Let us try to bear in mind the overall picture that emerges from this mass of detail. The First Strategic Echelon had in all 170 divisions, either tank, motorized, cavalry or rifle; 56 of these were stationed right up against the state frontiers.

The remaining 114 divisions of the First Strategic Echelon were lying inside the territory of the western frontier districts, within moving distance of the frontier. One question interests us - how many of these 114 divisions began to move towards the frontiers under cover of that soothing TASS report? The answer is that they all did. 'Between 12 and 15 June, the western military districts were ordered to move all divisions in the interior of the country into positions closer to the state frontiers.' (V. Khvostov, Major-General A. Grylev, *Kommunist* 1968, No. 12, p. 68) To these 114 divisions of the First Strategic Echelon we may add the 77 divisions of the Second Strategic Echelon which, as we already know, had either begun to move westwards, or else were preparing to do so.

The 13 June 1941, therefore, marks the beginning of the greatest displacement of troops in the history of civilization. The TASS report, published on the same day, speaks not only about German intentions, but also about Soviet plans:

Rumours to the effect that the Soviet Union is preparing for war with Germany are false and provocative . . . the summer training courses now being held for Red Army reservists, as well as the impending manoeuvres, have as their purpose nothing more than the training of reservists and testing how the railway system

works. It is general knowledge that they are held every year, and it is therefore absurd, to say the least, to portray these measures as hostile to Germany.

When this declaration is compared with what in fact was actually happening, we discover that the words used do not always tally with the facts.

The TASS report attempts to explain these troop movements as 'testing the railway system'. Let us beg leave to doubt this. The Soviet troop movements began in February. They were stepped up in March, reached enormous proportions in April and May, and became truly all-embracing in June. These movements involved those divisions which had already been moved up close to the German frontier; those which were preparing to invade Iran; and those which had remained in the Far East. The full build-up of Soviet troops on the German frontier was planned to have been completed by July. (General of the Army S. P. Ivanov, *Nachalnyi Period Voyny*, Moscow Voenizdat 1974, p. 211) The railways, which were the country's principal means of transport, were paralysed for almost six months by these secret military movements. In the first half of 1941, all the indices in the State Plan were disrupted, except the military ones. The principal reason for this was transport. The second was the covert mobilization of the male population into the new armies which were then being formed. It is surely not quite right to use the term 'testing' to describe such widespread disruption of the State Plan.

The TASS Report describes these manoeuvres as 'the usual exercises', but the accounts of Soviet marshals, generals and admirals refute this. Major-General S. Iovlev, for example, recalled how 'these call-ups for training were so unusual, and had not been provided for in military training plans, that they put people on their guard'. (*VIZH* 1960, No. 9, p. 56)

Vice-Admiral Ilya Azarov has pointed out that 'as a rule, training exercises were held nearer to autumn, and here they were beginning in the middle of the summer'. (*VIZH* 1962, No. 6, p. 77) Colonel-General I. Lyudnikov backs this up: 'Reservists are usually called up after the harvest has been gathered in ... This rule was broken in 1941.' (*VIZH* 1966 No. 9, p. 66)

General Mikhail Kazakov was in the General Staff at the time and personally met Lieutenant-General Mikhail Ferdorovich Lukin and other commanders who had been secretly sent to the Soviet western frontier.

He is quite categoric that, 'it was clear that it was not manoeuvres they were going on'. (*Nad Kartoi Bylykh Srazheny*, Moscow Voenizdat 1971, p. 64)

Let us note that all these marshals and generals use the term 'under the guise of exercises'. The pretence that these movements were exercises simply concealed the true purpose of this regrouping and build-up of Soviet troops. But nobody has ever said what this true purpose was. Four decades after the war ended, the true aim of these troop movements still remains a Soviet state secret.

At this point the reader might suggest that the reason for all this was that Stalin perhaps sensed that something hostile was afoot, and concentrated these troops there for defensive purposes. But these preparations had nothing to do with defensive measures. Troops who are preparing for defence dig themselves in. This is an inviolable rule, which every Soviet non-commissioned officer has taken to heart ever since the Russo-Japanese War, and all the wars which followed it. The first thing which troops who are preparing for defence do is to cover the widest fields over which the enemy will advance, cover the roads, put up barbed-wire entanglements, dig anti-tank ditches, and erect defensive and cover installations behind water defences. But the Red Army did nothing like this. As we have seen, the Soviet divisions, armies and corps pulled down the defensive installations which had been erected previously. The troops were not concentrated *behind* the water defences, as is done to aid defence, but *in front* of them, which can only aid attack. Soviet troops did not intercept these wide fields which would suit an enemy advance. They hid in the forests instead, just as those German troops were doing as they themselves prepared to attack.

But were not all these measures perhaps just a display of power? Of course not; to be effective, such a display must have been visible to the enemy. The Red Army was not giving a display but, quite the reverse, was trying to conceal its preparations. The TASS report was not written to frighten the enemy, but to set his mind at rest.

It is striking how the German Army was doing exactly the same thing in those days. It moved up to the border and hid in the forests, but these movements were very difficult to hide. Soviet reconnaissance aircraft flew over German territory 'by mistake'. But no one shot them down. Nor was it only ordinary pilots who flew over German territory. Commanders of much more senior rank made these flights as well. Air Major-General G. N. Zakharov, who commanded the 43rd Fighter Division of the Western Special Military District, looked down upon German troops from above and said 'one had the impression that there was being generated, in

the depth of this vast territory, movement which came to a halt at the frontier, pushing against it as against some invisible barrier, and ready at any moment to pour over the top'. (*Povest' ob Istrebitelyakh*, Moscow, Izd DOSAAF 1977, p. 43)

Interestingly, German pilots also flew over Soviet territory 'in error', and nobody shot them down either. I have found in old captured archives impressions given by a German pilot who describes the Soviet troops in exactly the same words. The accounts of Soviet officers are fully corroborated by German military intelligence: prior to 22 June 1941, the Red Army was moving towards the frontier in a massive tide.

Many other independent sources say the same thing. Georgy Alexandrovich Ozerov was one of the deputies to Andrei Nikolaiyevich Tupolev, the aircraft designer. In June 1941, he was in prison along with Tupolev and his entire design team. Ozerov later wrote a book that was distributed in the Soviet Union in *samizdat* form, by-passing the usual censorship. From there it reached the West, where it was published in Germany. Ozerov's account captures the awesome rhythm of the Red Army's massive movement towards its western border, which made itself felt even in Soviet prisons. 'People living in houses on the roads of Byelorussia and Windau,' he wrote, 'are complaining that they cannot sleep at night for the noise of trains laden with tanks and guns rumbling past.' (*Tupolevskaya Sharaga*, Frankfurt-am-Main, Posev, 1973, p. 90)

After my first articles on this subject were published, I received many letters which give a picture of the enormous movement westwards of Soviet troops. People of the most varied nationalities and types wrote to me: Estonians, Jews, Poles, Moldavians, Russians, Latvians, Germans, Hungarians, Lithuanians, Ukrainians, and Romanians. All of them for a variety of reasons were in the 'liberated' territories at the time. The war was later to scatter these people to the four corners of the earth. Their letters come from Australia, the United States, France, Germany, Argentina, West Germany, and even from the Soviet Union. I received a letter from someone in Canada who had been a soldier in the Russian Liberation Army. He was in the Red Army in 1941, was sent to the frontier, and was hiding with his regiment in the forests in the border area when he was caught by the war. He was taken prisoner, joined the Russian Liberation Movement, was taken prisoner again, and escaped to spend a long life under strange names in strange lands. The soldier showed me several books written by former commanders and troops of the Russian Liberation Army (ROA), who miraculously survived after the war. Interestingly, they all begin their books from the moment when Soviet troops began to move towards the border.

Many other witnesses, and people who knew them well, have written to scientific journals, and on occasions some of these letters are published. James Rushbrook, a British citizen, draws attention to a book entitled *The Promise Which Hitler Kept*, written in 1944 by Stefan Stsende, and published in 1945 in Sweden. The author is a Polish Jew who was in L'vov in 1941. Here is his impression of these days which preceded 22 June:

Military trains crammed full of troops and military equipment passed with increasing frequency through L'vov heading westwards. Motorized units drove through the main streets of the town, and at the railway station all traffic was purely military. (RUSI, June 1986, p. 88)

I am grateful to all those who write to me and to journals, as they keep adding new fragments to the picture of the Red Army's general movement westwards. In addition, there are thousands of documents preserved in Soviet archives which bear out what I say. Very few people have access to these archives, and the most interesting documents have long since been destroyed. Traces of this destruction are all too apparent; sometimes as many as a hundred pages may be missing from a document. (Even so, I ask those who work in the archives to pay heed to the enormous amount of confirmation which exists there of these Soviet troop displacements westwards. I do not ask you to publish the corroboration you find, but simply that you yourselves bear it in mind, for your own personal interest.) In addition to secret archives, there is an ample supply of overt official publications, including the histories of the Soviet military districts, armies, corps and divisions. Anyone interested in this subject can quickly find thousands of statements like this one:

Even before the war began, on the instructions of the General Staff of the Red Army some formations of the Western Special Military District began to move up to the state frontier. (*Krasnoznamennyi Byelorussky Voennyyi Okrug*, Moscow Voenizdat 1983, p. 88)

Should anyone consider all these sources to be unreliable, there is one corroboration which it is impossible to refute: the subsequent history of the war itself. After the Germans had routed the First Strategic Echelon and broken its defences, their advance units suddenly came up against new divisions, corps and armies - such as the 16th Army near Shepetovka - whose existence the German commanders had not even suspected. The whole *Blitzkrieg* plan had been built on the calculation that the Soviet troops stationed right on the frontier would be routed by a lightning strike. But once it had successfully carried that plan into effect, the German Army then discovered itself up against another wall of armies which had moved up from beyond the Volga, the Northern Caucasus, the Urals, Siberia, Trans-Baikal and the Far East. Thousands of railway wagons were needed for one army alone. They had to be brought up to the stations for loading, and then the troops, heavy armament, vehicles and supplies all had to be put on the trains and then transported across thousands of kilometres. If the German troops encountered Siberian, Urals and Trans-Baikal armies at the end of June, this means that their transfer to the west must have begun, not on 22 June, but earlier.

While this was going on Soviet naval forces were also on the move. The official Estonian history of the war states that the Soviet Baltic Fleet left the eastern part of the Gulf of Finland on the eve of hostilities. (*Estonian People and the Great Patriotic War*, Tallinn Eesti Raamat 1973, Vol. I, p. 143) Let us look at the map. If the fleet emerged from the eastern part of the Gulf of Finland it had only one direction to go in, westwards. It was certainly not sailing on an exercise; its task 'was actively to work on the enemy's sea communications'. (*Ibid*) The war had not yet begun, Stalin still did not know that Hitler was going to attack him, yet a Soviet fleet had already left its base with the combat task of active offensive operations!

At the same time, transfers from one air base to another were proceeding at an intensive rate in the air forces. Whole air divisions and regiments, flying at night and in small groups in the guise of carrying out exercises, redeployed to airfields, some of which were less than 10 kilometres from the frontier. It was not just combat sub-units of the air force which were being sent westwards. There were also, in increasing numbers, the latest types of aircraft which had not yet been given to any regiments or divisions. Colonel-General L. M. Sandalov recalled that 'We began to receive new operational technical armament from 15 June onwards. The Korbin and the Pruzhan fighter regiments were given Yak-1 fighters armed with cannon; the ground-attack

regiment was given 11-2 aircraft, and the bomber regiment Pe-2s.' (*Na Moskovskom Napravleny*, Moscow Nauka 1970, p. 63)

At that time fighter regiments each had 62 fighter aircraft, 63 ground-attack aircraft and 60 bombers each. One division alone (the 10th Mixed Aircraft Division) expected to be given 247 of the latest aircraft. Sandalov also states that when the division began receiving the new aircraft, the old ones were not phased out. In this way the division was turned into a great fighting machine numbering several hundred aircraft. Archival documents show that this process was going on everywhere. The 9th Mixed Aircraft Division, for instance, which was located alongside and had also been moved up close to the frontier, had 409 aircraft, including 176 of the latest MIG-3s and also a few dozen Pe-2s and I1-2S. But new aircraft kept on coming.

On the morning of 22 June, the same Western Front was ordered to accept 99 MIG-3 aircraft at Orsha airfield. (*Komando-vanie i Shtab VVS v VO V*, Moscow Nauka 1977, p. 41) If they were ordered to accept them on the morning of 22 June, then obviously the aircraft were ready for sending on the evening of 21 June. Chief Air Marshal A. A. Novikov has stated that on 21 June, the Northern Front (where he was then Officer Commanding VVS¹⁰ with the rank of air major-general) was given an echelon of MIG-3 fighters. (VIZH1969, No. 1, P. 61)

In addition to the fighter aircraft, there was a solid flow of tanks, artillery, ammunition and fuel: 'A military train carrying a heavy artillery regiment arrived for off-loading at the Shaulyai station at dawn on 22 June.' (*Bitva za Leningrad*, Moscow Voenizdat 1964, p. 22) Not just one military train, of course, and not only with guns: 'By the end of June 1941, there were 1,320 trains laden with motor vehicles standing on the railways.' (VIZH 1975, No. I, p. 81) The standard weight for a military train at that time was 900 tons (45 wagons each weighing 20 tons). Assuming that there was one vehicle to every wagon, this would mean that at least 59,400 vehicles were expected to be offloaded. However, it often happened that, in conditions where an enemy attack has not been foreseen (and this one was not foreseen), the vehicles were loaded 'like a snake', that is with the front wheels of each vehicle placed on the body of the one in front. In this way an increased number of vehicles can be loaded onto one train.

¹⁰ Soviet Air Force.

Someone must have gathered together this great quantity of railway wagons and motor vehicles, loaded the vehicles on to the wagons, and conveyed them across a vast distance to the western frontier. This process clearly began before the war started. Yet no one succeeded in unloading these vehicles. Meanwhile, military trains carrying ammunition kept arriving one after the other in a never-ending stream. The *Red Star* newspaper wrote on 28 April 1985 that 'on the evening of 21 June 1941, the manager of that sector of railway lines controlled by the Liepaja station was told to "accept a special train. It's carrying ammunition. It has to be sent on to its destination at the first opportunity."' At that time Liepaja was very close to the frontier. The train was in transit, and there was nowhere it could have been bound for except the frontier itself.

Ammunition was held in great quantities in railway wagons on all fronts. This is usually done before preparing for an offensive in great depth. It is simpler, more reliable and cheap in a defensive war to keep ammunition in previously prepared defensive positions. When they have used up the ammunition at one defensive position, the troops can easily and quickly withdraw to the second position with its previously prepared supply of ammunition, and then to a third position and so on. But before an offensive, ammunition is stored on mobile transport, which is a very expensive and dangerous thing to do. 'At the small railway station of Kalinovka alone, the South-West Front had 1,500 wagons laden with ammunition.' (*Sovetskie Zheleznodorozhniki v Gody Velikoi Otechestvennoi Voyny*, Izd. AN. SSSRI963, p. 36)

I have much material showing how military trains laden with ammunition were saved in 1941. It did not of course prove possible to save them all. Artillery Colonel-General Ivan Ivanovich Volkotrbenko relates that in 1941 the Western Front alone lost 4,216 wagons carrying ammunition. (*VIZH*, No. 5, 1980, p. 71) But there was not just one front, but five, and the Western Front was not alone in losing ammunition wagons. Let us try to imagine the amount of ammunition on all five fronts which fell into enemy hands, and the amount which was able to be saved. In the middle of June, under cover of the TASS statement, all this ammunition was rolling in closed wagons straight for the German frontier.

Marshal of the Soviet Union Simion Konstantinovich Kur-kotkin reports that at the beginning of June, 'on a proposal from the General Staff, the Soviet government approved a plan to shift 100,000 tons of fuel from the interior regions of the country'. (*Tyl Vooruzhennykh Sil SSR v VOV*, Moscow Voenizdat 1977, p. 59) Other decisions similar to this one were apparently also being taken. 'About 8,500 railway cistern wagons, all containing fuel, piled up at railway junctions and even at halts between stations.' (*Ibid*, p. 173) Assuming that

only the smallest 20-ton cistern wagons were used, then we are not just speaking about 100,000 tons, but of a much greater quantity. The usual cistern wagon in use in 1940 was not of 20 tons, but of 62 tons. Consequently we can see that there were huge quantities of fuel involved here. But these 8,500 were only those cistern wagons which were standing at stations in the early days of the war, waiting to be off-loaded. We must also take into account what had already been destroyed at railway stations by the enemy air force as the war was breaking out. Colonel-General Ivan Vassilyevich Boldin, then a lieutenant-general and deputy officer commanding the Western Front, later remarked that the 16th Army, the most powerful in his front, had sufficient reserves of fuel in storage tanks and in railway cistern wagons, but that all this was lost in the first minutes and hours of the war. (*Stranitsy zhizni*, Moscow Voenizdat 1961, p. 92)

On the eve of war, this great mass of cistern tanks, along with trains laden with troops, technical equipment, arms and ammunition, was moving up to the frontier.

When we speak of the reasons for the Red Army's defeats in the initial period of the war, we sometimes forget the main reason, which is that the Red Army was in railway wagons at the time. General of the Army, Simion Pavlovich Ivanov, then a colonel in charge of the operations branch of the 13th Army headquarters, describes how Biryuzov's 132nd Rifle Division was caught unprepared:

The enemy suddenly attacked the train, in which part of the strength of the division, along with its headquarters, was bound for the frontier. They had to go into battle straight from the wagons and the railway platforms. (*Red Star*, 21 August 1984)

Marshal Biryuzov, then a major-general recalled the chaos that ensued:

We were added to the complement of the 20th Mechanized Corps at the very last minute. I could not find either the commander or the chief of staff of the corps, in fact I did not even know where their command post was. The 137th Rifle Division, under the command of Colonel I. T. Grishin, was operating to the left of us. It had come from Gor'kii . . . Our neighbour on our right was thrown into battle as we were, straight from the railway wagons, even before all their military trains had reached their off-loading points. (*Kogda Gremeli Pushki*, Moscow Voenizdat 1962, p. 21)

General of the Army, Sergei Shtemenko, then a colonel in the operations headquarters of the General Staff, reported that

troop trains were moving west and south-west in an uninterrupted stream. First one of us, then another went to the offloading stations. The ever-changing situation and its complexity often compelled the off-loading to be stopped and the trains to be sent on to some other station. It happened on occasions that the divisional command and its headquarters were off-loaded in one place, and the regiments in another, or even in several places all some considerable distance apart. (*General'nyi Shtab v Gody Voyny*, Moscow Voenizdat 1968, P. 30)

Soviet publications contain thousands of accounts of how the German attack found the Red Army in transit and unprepared for such an onslaught. Colonel-General A. S. Klemin recalled how, in early July 'there were 47,000 wagons carrying military loads moving on the railways'. (*VIZH* 1985, No. 3, p. 67)

'Many rail junctions were almost completely paralysed by this great accumulation of wagons. At most stations only one track was left free to allow other trains to pass through.' (I. V. Kovalev: *Transport v VO V*, Moscow Nauka 1981, p. 59)

It might be suggested that this vast mass of troops and equipment had been put on the trains after 22 June and then sent to the fronts. This is a mistaken proposition. After 22 June, the fronts needed empty wagons

only, to remove the vast reserves of arms, ammunition, fuel and other military supplies which had already been stockpiled at the border.

In order to realize the tragedy of the situation, one must remember General Lukin. He was already fighting near Shepetovka as officer commanding his army while the headquarters of his army was still in Trans-Baikal. The trains carrying his army were thousands of kilometres apart. Then the headquarters arrived, but its communications battalion was still somewhere on the way. Situations like this were occurring everywhere. Headquarters without troops were off-loaded at some stations, while troops without headquarters were off-loaded at others. It was worse when a train stopped in the open country instead of at a station. A tank battalion is a great force, but it is completely defenceless on a train. If the fighting caught a train laden with heavy technical armament at a place where there was nowhere to unload it, then the train either had to be destroyed or abandoned. The losses in military trains were enormous.

But even those divisions which were in the First Strategic Echelon and were making their own way to the frontier were in no better a position. A division marching in columns is an excellent target for any air force. The entire Red Army had made an excellent target of itself.

Many people saw the transfer of Soviet troops taking place, but each individual saw only a part of it. Few could have imagined its true scale. German military intelligence had assessed that a great build-up of fighting strength was taking place, but all it saw was the First Strategic Echelon, never suspecting that there was a second, and indeed a third, which we shall come to in another book. I believe that many Soviet marshals and generals, with the exception of the most eminent, or those who were directly involved in these troop transfers, likewise had no idea of their true dimensions, and consequently, of their significance. That is why many of them talk about them in so serene a manner. Their ignorance about the general situation and the true extent of the build-up of Soviet troops was in no way fortuitous. Stalin took draconian measures to cover it up. His TASS report was one of these measures. It was clearly impossible to conceal the actual fact that troop transfers were taking place. But amazingly Stalin succeeded in concealing both the dimensions of these transfers and their purpose from the entire country, from German intelligence and even from future generations.

Air Colonel-General Alexander Sergeiyeovich Yakovlev, who was a personal aide to Stalin at the time, bears witness that 'at the end of May or beginning of June' a meeting was held in the Kremlin to discuss matters related to camouflage and deception. (*TseV Zhizni*, Moscow IPL 1968, p. 252)

An incident recounted by Marshal Matvei Vassilyevich Zakharov reveals the degree of secrecy surrounding these troop movements:

At the beginning of June, Colonel P. I. Rumyantsev, the chief of VOSO¹¹ of the Odessa Military District, came round to see me in my office when I was chief of staff of the Odessa Military District and told me in secret that over the past few days 'Annushkas' had been passing through the Znamenka railway station from the Rostov direction and would be off-loaded near Cherkassy. 'Annushka' is a term which is used in the VOSO to mean a division. Two days later, I received an enciphered message from Cherkassy, signed by M. A. Reiter, deputy officer commanding the troops in the Northern Caucasus Military District, in which he asked permission to take over some clothing-storage hutments in our district for storing the belongings of troops which had just arrived in this area from the Northern Caucasus. As the headquarters of the Odessa Military District had not been informed about any concentration of troops here, I rang the operations headquarters of the General Staff on the VCh.¹² A. F. Anisov, the deputy chief of the headquarters came to the telephone. I told him about the enciphered message I had received from M. A. Reiter, and asked him to explain what it was all about. Anisov replied that I must destroy Reiter's message at once, that he (Reiter) would be given the necessary instructions from the General Staff, and that the Military District headquarters was not to interfere in this matter. (*Voprosy Istory*, 1970, No. 5, p. 42)

Marshal Zakharov also states that Colonel-General Yakov Timofeyevich Cherevichenko, who was commanding the troops in the Odessa Military District, likewise knew nothing about the 'Annushkas'. It may be argued that when Soviet troop movements take place, precautionary measures are always taken, and that Soviet troops always keep their intentions secret. This is quite true. But everything has a limit. An officer

¹¹ Central Office of Military Railway Communications.

¹² High-Frequency Governmental Communications.

commanding a military district in the Soviet Union - particularly one who commands a military district on the frontier - and his chief of staff are persons who have been invested with special plenary powers and authority. They take full responsibility for everything which takes place on the territory which is under their control. Even in the case where the commander of the Odessa military district learnt by chance that a concentration of outside troops was taking place on his territory, the General Staff, which was commanded by G. K. Zhukov, ordered him to forget the information he had been sent, and to destroy the secret enciphered message which had been intended only to be read by the military district chief of staff. This enciphered message represented a danger even as it lay in the chief of staff's safe.

Lieutenant-General M. A. Reiter's behaviour was interesting. Max Reiter was a disciplined German. He had been a colonel in the Russian Army in World War I, an old hand of Prussian stock. He knew very well how to keep a secret. But even he regarded it as perfectly natural, when he turned up with his 'Annushkas' on the territory of another military district, to get in touch with his counterpart and ask his permission (in personal coded message of course!) to do something. The General Staff quickly set his thinking straight, and he did not write a cipher message like that again.

Molotov summoned the German ambassador on 13 June and handed him the text of the TASS report. (V. Khvostov and Major-General A. Grilev, *Kommunist*, No. 12, 1968, p. 68) This stated that Germany did not wish to attack the Soviet Union, and the Soviet Union did not wish to attack Germany, but that 'forces hostile to the Soviet Union and Germany which were interested in developing and extending the war' were trying to cause trouble between them by spreading provocative rumours that war was near. The report names these 'hostile forces' as Sir Stafford Cripps (the British ambassador in Moscow), London and the British press.

It would be reasonable to suppose that a meeting also took place that day in London between Anthony Eden, the British Foreign Secretary, and Ivan Maisky, the Soviet ambassador in London. Imagine the scene: Maisky throws the TASS report on the table, stamps his foot and demands that ambassador Cripps be withdrawn from Moscow, that the sowing of dissention between the good friends Stalin and Hitler should stop, and that provocative rumours about war between the Soviet Union and Germany should cease.

On 13 June 1941 a meeting did in fact take place between Maisky and Eden. Maisky did not hand over a copy of the TASS report to the British government, he did not stamp his foot, and the meeting passed off in a friendly atmosphere. The discussion was concerned with what measures the British government could take to help the Red Army 'should war break out between the Soviet Union and Germany in the near future'. Specific measures included direct combat operations by the Royal Air Force to help the Red Army, military supplies, and co-ordination of operations undertaken by the military commands of the two countries. (*Istoriya Vtovoï Mirovoi Voïny*, Vol. 3, p. 352)

On 13 June, Stalin's diplomats were laying the foundations of what would soon be called the Anti-Hitler Coalition. There was nothing wrong with this from the British side. Britain was at war with Germany. The Soviet Union, however, was playing a dirty game. It had concluded a non-aggression pact with Germany and, immediately after this, a treaty of friendship. If the Soviet government had decided that these documents were no longer relevant to a situation which had really become very complex, they should have abrogated them. But Stalin did not do this. He went on assuring Hitler of his ardent friendship and claimed in the TASS report that it was the British politicians who wanted to extend the war.

The neutral diplomatic tone concealed some highly serious matters. Soviet diplomats had quite recently held negotiations with Germany over Poland 'should changes occur on the territory of the Polish state'. The time had now come when Soviet diplomats were striking a similar tone about Germany behind her back. It is surprising that, in the negotiations in London, both sides used the phrase 'if war begins', instead of saying 'if Germany attacks'; to put it another way, the interlocutors were not in any way excluding the possibility that a war could begin, not as a result of German aggression, but in some other way. It is interesting that at the negotiations in London, the Soviet Union put itself down first — 'if war breaks out between the USSR and Germany'. The TASS report too, speaks of 'rumours that war is near between the USSR and Germany'. If Germany was considered the most likely aggressor, why not put it the other way round?

Someone may perhaps argue that the Soviet ambassador was holding these negotiations without Stalin's knowledge, exceeding his authority as did those Soviet generals who assembled their troops on the borders 'without notifying Stalin'. But Maisky himself has emphasized that when he was leaving for London in 1932, he had a meeting with M. M. Litvinov. Litvinov, who was People's Commissar for Foreign Affairs, warned Maisky that while *en paste* he would be carrying out instructions, not from Litvinov, but 'from higher

instances'. Only Molotov, who was head of the government of which Litvinov was a member, and Stalin were 'higher' at that time. In 1941, Litvinov had already been dismissed, so there remained only two 'higher instances', Molotov and Stalin. Maisky survived the purges, and remained in his post for a very long time. His head remained on his shoulders only because he did not infringe any of the instructions sent him by the 'higher instances'.

In order to have a clear understanding of Comrade Maisky and Soviet diplomats generally, it must be added that after he returned to Moscow after having served in London for eleven years, he accompanied Stalin to conferences with Churchill and Roosevelt, in order to ask that aid be increased. He then wrote a book entitled *Who Helped Hitler? (Kto Pomogal Gitleru)*, Moscow IML 1962) We learn from this book that Hitler could not have begun World War II by himself, and that Britain and France helped him to do so. The Soviet ambassador then went on to lay the blame for 'suffering and sacrifices without number' on the shoulders of the country which offered Stalin military and economic help as far back as 13 June 1941.

The purpose of the TASS report was to put an end to rumours that war between the Soviet Union and Germany was inevitable. Stalin waged determined warfare on these rumours. On the night of 13-14 June, there was a sudden outburst of terror in Moscow. Heads came off, including some very eminent ones.

Hitler had the same problem. War preparations are difficult to conceal. People see them, and express all sorts of suppositions about them. On 24 April, the German naval attache sent an anxious report to Berlin that he was having to counter 'clearly absurd rumours about a forthcoming German-Soviet war'. On 2 May, ambassador Von der Schulenberg reported that he was having to counter rumours, but all German officials who were arriving from Germany were bringing 'not only rumours, but facts to back them up'. On 24 May, Karl Bohmer, head of the foreign press department of the German Ministry of Propaganda, got into a drunken state and said something indiscreet about relations with the Soviet Union. He was immediately arrested. Hitler took up the matter personally, and in Goebbels's words 'attached too serious a significance' to it. On 13 June, the day the TASS report was given out, Karl Bohmer stood before a people's court (how staggering - a people's court, just as in the Soviet Union) and declared that what he had said had been drunken gibberish.

This did not save the unfortunate Bohmer from heavy punishment, which served as a good lesson for all Germany – there would be no war! There would be no war! There would be no war! And just so that nobody abroad should have any doubts about it, Ribbentrop sent top-secret telegrams to his ambassadors on 15 June, saying that it was planned to hold highly important negotiations with Moscow. The ambassadors had to relay this information to certain people in the strictest secrecy. For instance, the counsellor at the German Embassy in Budapest had to convey the news to the Hungarian president as a special secret.

The principles of disinformation are the same for everyone. If you do not want the enemy to learn the secret, then keep it away from your friends as well! On 8 May 1940, German radio announced that Britain intended to invade the Netherlands. There then followed the most interesting part of the announcement, which was that information to the effect that two German armies had been moved up to the border with Holland was 'absurd rumour' put into circulation by 'British warmongers'. What happened thereafter is common knowledge. These two announcements, one from German radio and the other from the Soviet agency T A S S, repeat one another almost word for word.

Following the appearance of my first publications, Soviet historians exclaimed that yes, Soviet troop movements had taken place, but that Soviet sources had long ago given a satisfactory (that is, a defence-related) explanation of what had occurred. This is very far from the truth. It was the absence of such an explanation which attracted my attention in the first place. Not one Soviet marshal or general has ever given the exact number of the divisions which took part in these vast movements. As we have seen, it was 191, but not one of them has ever given even an approximate figure. But can we really expect a satisfactory explanation from a general if he does not know, or is concealing the true dimensions of everything which took place?

The memoirs of the generals and marshals who had either directed or taken part in these troop movements display a surprising flexibility on the part of Soviet historical science. Colonel-General Ya. T. Cherevichenko, officer commanding the troops of the Odessa Military District, was in the Crimea between 9 and 12 June, where he received the troops of the 9th Special Rifle Corps. We learn this from Marshal M. V. Zakharov.

(*Voprosy Istory*, 1970, No. 5, p. 44) We shall return to this corps later. It was a most unusual one, and it was not for nothing that it was officially named 'special'. But for some reason or other, General Cherevichenko passes it over in silence. This, incidentally, is the same Cherevichenko who was unaware that an entire army under the command of Lieutenant-General I. S. Konev and his deputy Lieutenant-General Max Reiter was secretly being concentrated on the territory of his own military district.

I. S. Konev became a marshal of the Soviet Union during the war, and I picked up his book in the hope of finding some explanation as to how he found himself with his 'Annushkas' in somebody else's military district, and why. Surprisingly, the gallant marshal has simply omitted the entire initial period of the war. He preferred to write about 1945, and so he entitled his book *Forty-Five*. I then picked up the memoirs of General of the Army P. I. Batov. It was his corps which Cherevichenko was meeting in the Crimea, but alas, Batov simply leaves out the facts. Batov was the deputy of the officer commanding the Trans-Caucasian Military District. What was he doing in the Crimea at the head of a corps on the eve of the war? Which divisions belonged to this corps? Why was the corps called 'special'? Who was the deputy commander of the corps, and who was its chief of staff? Why was the corps trained to board ships, land on a hostile coast, and destroy oil derricks? We can find answers to all these questions, after prolonged research, from many different sources, but these do not include the memoirs of Batov, who simply omits the entire period.

Having failed to find the explanations there, I then raised my sights. But neither Stalin nor any of the members of the Politburo wrote any memoirs. The only really senior figure to leave an account of his wartime experiences was Marshal Zhukov. He was Chief of the General Staff at the time, and was personally responsible for the deployment, garrisoning and movements of troops. Without his official stamp, it would have been impossible to move even one battalion, let alone regiments and divisions. What was more, the VOSO service, that is, everything related to the military use of the railways, was directly subordinated to him.

Zhukov admits that troop movements did in fact take place, and that they were of monumental dimensions. But instead of giving figures and explaining them from the height of his position as Chief of the General Staff, the three pages Zhukov devotes to the troop movements simply quote his friend I. Kh. Bagramyan, who was a colonel at the time. Listen to what Bagramyan thinks about this — Bagramyan who had no access to state secrets! Listen to Bagramyan, who was in the First Strategic Echelon where he only carried out orders sent by

Moscow, who only accepted one military train after another without being given any explanations as to what they were needed for.

Dear Georgy Konstantinovich, comrade Marshal of the Soviet Union! If we want to find out Ivan Khristoforovich Bagramyan's opinions, we shall simply open his excellent books and read them. But we are interested in finding out from your memoirs your point of view, your figures and your explanations. We want to see the situation from the dizzy height of your position and not from Ivan Khristoforovich's parochial post. He speaks well and at length. He possesses shining erudition, a fine analytical mind, an excellent memory and great knowledge of the situation. But he played no part in the troop movements, nor did he direct them. The troop movements were directed by you. Zhukov's sharp manoeuvre behind Bagramyan's back, and the lack of exact figures and explanations only strengthen the suspicion that not everything was straightforward, that not everything had been said, and that there was something here which, then as now, was not for publication.

CHAPTER 23

The Military Districts

There is a long-established procedure in the Red Army whereby the command leaves for the place where the operations are to take place before the troops arrive there.

Marshal K. ROKOSSOVSKY
(*Soldarsky dolg*, Moscow 1968, p.
166)

As the Soviet general moves up the promotional ladder, he passes in turn through the posts of commander of a division, commander of a corps, and then of officer commanding an army. The next post, officer commanding a military district, is not just a step upwards. It is a sharp quantum leap. The fact is that an officer commanding a military district is not simply a very high-ranking military chief; he is in his way the military governor of great territories where millions and indeed tens of millions of people live. He is not only responsible for the troops and their military training, but also for preparing the population, industry, transport and agriculture to fight a war. He is responsible for protecting the communist regime in the territories entrusted to him and, should the need arise, to resort to armed force to defend that regime.

Before World War II, the territory of the Soviet Union was divided into sixteen military districts. Eight of them had common frontiers with foreign states. The remaining eight had no frontiers and were therefore considered internal military districts. Each district, of course, was important in its own way. It was in the internal districts that vast industrial potential, transport arteries and great human resources were concentrated.

On 13 May 1941, the officers commanding seven of these internal military districts (the exception was the Moscow District) were given a directive of 'special importance'. The headquarters of the military districts were to be converted into army headquarters. The officers commanding the military districts were to head these armies personally; they were to take along with them all the corps and all the divisions which made up the

complement of their districts. Within exactly one month, on 13 June 1941, they were ordered to begin a secret regrouping in the western part of the country.

On 13 June 1941, under cover of the TASS report, all the divisions which belonged to the Urals Military District began to move secretly westwards. The divisions were combined into corps, and the corps were in turn combined into the 22nd Army. Lieutenant-General Filipp Ershakov, the officer commanding the Urals Military District, personally stood at the head of this army. Dimitri Sergeyevich Leonov, corps commissar and member of the Military Council of the District, and Major-General Georgy Ferdorovich Zakharov, Chief of Staff of the District, became respectively members of the Military Council and Chief of Staff in the emergent army. Officers in charge of artillery, engineers, the rear, communications and all the rest, took all those under their command into the 22nd Army, and put them aboard military trains which then moved off heading west.

Who then was to remain behind in the Urals? The Urals contained (and continue to contain) the world's largest steel, tank and shell production complexes. The Urals meant lines of communication of the utmost importance. The Urals also meant concentration camps, with hundreds of thousands and, quite possibly, millions of prisoners. Would it not be too dangerous to leave all these territories without a military governor? It might be suggested that every commander has a deputy who stands in for him during his absences. But the trouble here was that Lieutenant-General M. F. Lukin, the deputy officer commanding the Urals Military District, had already been given orders to leave for Trans-Baikal. He had set up the 16th Army there, and at the time when the TASS report was issued, his army was secretly moving westwards. After all the Command Staff had departed, therefore, the completely unknown Major-General A. B. Katkov was left in charge of the Urals Military District, with practically no staff to support him.

The same thing happened in the Khar'kov Military District. We know that the 18th Army was formed on the eve of the war on the Romanian frontier. The command and headquarters of this army was the command and headquarters of the Khar'kov Military District. Lieutenant-General A. K. Smirnov, the officer commanding the district, Major-General V. Ya. Kolpachki, its chief of staff, Major-General S. K. Goryunov, its air commander, and everyone under their command, were transferred to the 18th Army on the Romanian frontier, thereby leaving their military district without any leaders at all.

The 19th Army was formed from the troops and headquarters of the Northern Caucasian Military District. Lieutenant-General I. S. Konev, officer commanding the district, combined all the troops of his district into

the 19th Army, stood at its head and moved it westwards in secret, thereby leaving the district without any military control whatever. In theory Major-General Max Reiter, the German communist and Konev's deputy, should have taken his place, but as we are already aware, he was not in the Caucasus at the time, but in Cherkassy, where the military trains of the 19th Army were arriving.

Let us glance at the command staff of the Air Force (the V VS) in the North Caucasus Military District. The officer commanding the VVS was Air Major-General E. M. Nikolaenko, the VVS Chief of Staff was Colonel N. V. Korneev, the commander of the Fighter Air Division was Air Major-General E. M. Beletsky. We find them in exactly the same posts after the TASS report was published, but no longer in this military district. They were in the 19th Army, which was secretly being moved into the Ukraine.

The 20th Army, likewise, was simply the officers and troops of the Orel Military District under another name. Lieutenant-General F. N. Remezov, the officer commanding this district, combined all his troops with those of the Moscow Military District under his command. He turned the district headquarters into the headquarters of the 20th Army and moved secretly westwards, thereby leaving the heart of Russia at the mercy of fate and without any military control.

The 21st Army was the Volga Military District. The officer commanding the district, Lieutenant-General V. G. Gerasimenko, became officer commanding 21st Army, General V. N. Gordov, chief of staff in the district became 21st Army Chief of Staff. Commanders of all sorts of troops and services, and hundreds of other commanders, simply changed the words in their titles from 'Volga Military District' to '21st Army'. If for instance you were to learn that Air Chief Marshal G. A. Vorozheikin was head of the air forces in the Volga Military District at the beginning of June 1941 (with a lower rank at that time, of course), you could be absolutely sure without looking up the records that after 13 June he became Air Chief in the 21st Army and then moved to the German frontier. If you knew that Colonel-General Yu. V. Bordzilovsky, who commanded the engineering troops in the district, although of course with a lower rank, was serving at the same time and in the same place in the engineering branch, then you could say without fear of contradiction that after the TASS report came out, he served in the engineering branch of the 21st Army.

The 24th Army was formed in the Siberian Military District, whose commanding officer was Lieutenant-General S. A. Kalinin, while the 28th Army was formed from the Arkhangelsk Military District, under the command of Lieutenant-General V. Ya. Kachalov.

On 13 June 1941, the very same day that strange reports were being broadcast by Soviet radio, the established order of military and territorial government which had been in force in the vast territories of central Russia, Northern Caucasus, Siberia, the Urals from Arkhangelsk to Kuban' and from Orel to Chita to all intents and purposes ceased to exist. If a revolt had erupted, there was nothing there to suppress it. All divisions had gone off to the German frontier. What was more, there was nobody left to take a decision to put down a revolt. Practically all the generals had also gone off secretly to the western part of the country. Revolts were usually put down by the NKVD, but a very serious one would have been too much for the NKVD troops alone to handle. The army would have been needed.

The question now arises - what was going on? Did Stalin perhaps not trust his officers commanding in the internal military districts and decided to replace them all at the same time? No, it was not like that. Stalin took the precaution of shooting all those whom he did not trust, and replaced them with others in whom he had confidence. It is essential to realize that practically no one was left behind to take the places of the generals who had left. After Lieutenant-General S. A. Kalinin, the officer commanding the Siberian Military District, converted all his troops and his headquarters into the 24th Army, which he then secretly transported westwards, no new general arrived in Siberia until 1942. (*Soviet Military Encyclopedia*, Vol. 7, p. 338) In all other internal military districts, new commanding officers did not arrive for several months, or else those who came were third-rate generals who, either before or afterwards, were never given the honour of commanding a military district or an army. Major-General Matvei Timofeyevich Popov in the Volga Military District is a striking example of this.

It only remains for us to suppose that all commanders and their troops had gone off to do something more serious than protecting Soviet authority in the country's internal areas. If it had been contemplated that they should do something less important than this, they would of course all have stayed where they were.

Moscow was the exception among the eight internal military districts. This is understandable, as the capital lay within it. In contrast to all other internal military districts, it was commanded not by a lieutenant-general, nor even by a colonel-general, but by General of the Army Ivan Tyulenev. But even the exceptional position of the Moscow Military District did not save it from being denuded of its headquarters and troops. All its troops were sent to reinforce the First Strategic Echelon and the 20th Army of the Second Strategic Echelon. All reserves of arms, ammunition and property were sent from the Moscow Military District to the western

frontiers. Then came the turn of the command. At that time General I. V. Tyulenev held a very high rank, as well as enjoying Stalin's special trust; too high a rank for someone who was just to command an army. The Politburo therefore decided in Stalin's presence to appoint Tyulenev officer commanding the Southern Front. When he left for there, he took with him the Moscow Military District's entire headquarters, which was headed by Major-General Gavril Shishenin.

The decision to re-form the command and headquarters of the Moscow Military District into the command of the Southern Front and transfer them to Vinnitsa was taken on 21 June 1941, but there is sufficient evidence to show that this decision came as no surprise to the officers in the headquarters. Many branches of the headquarters were already on the move; Major-General A. S. Osipenko, for example, deputy officer commanding the air force of the Moscow Military District, was already on the Romanian frontier at the beginning of June 1941.

The command and headquarters left for Vinnitsa, effectively abandoning the military district of the capital city without handing over their duties to anyone, since nobody had been appointed to take the places of the departing commanders. Lieutenant-General P. A. Artem'ev did not take over its command until 26 June, *after* Germany had attacked. (*Ordena Lenina Moskovsky Voennyi Okrug*, Moscow, Moskovsky Rabochy 1985, p. 204) Artem'ev, moreover, was not a soldier but a Chekist. The post which he went on holding and brought along with him to the Moscow Military District was that of head of the Directorate of Operational Troops of the NKVD. Then in July, Stalin appointed K. F. Telegin, who was a divisional commissar for NKVD troops, and who later became a lieutenant-general, to be a member of the Military Council of the Moscow Military District. He also was a pure-blooded Chekist, who had previously served in OSNAZ units. During the Great Purge, he was political commissar for the NKVD internal troops of the Moscow District, and following that he held some responsible position inside the central apparatus of the NKVD.

Even during the Great Purge, the military districts had remained military. Now, in time of war, there was no difference between the Moscow Military District and the Moscow NKVD District. The Moscow Military District did exist in theory, but there were no Red Army military units in Moscow. There were only two NKVD divisions and 25 detached fighter battalions, also of the NKVD.

Lieutenant-General Konstantin Ferdorovich Telegin recalls that when these 'new people', that is the Chekists, first arrived in the Moscow Military District headquarters, many branches in the headquarters lost

much of their staff. The two most important branches, operations and intelligence, had completely ceased to exist. The new people had little understanding of the inherent characteristics of military matters, and they had to 'waste no small amount of time and effort learning about the state of the district and its problems and capacities'. (*VIZH*, 1962, No. I, p. 36)

Thus, under the cover of the TASS statement, the most high-ranking military commanders at the head of armies, and including even one who commanded a front, were secretly transferred to the German frontier, thereby leaving all the internal military districts at the mercy of fortune and the NKVD. It is beyond dispute that nothing like this has ever happened in Soviet history either before or since. It is also indisputable that these movements were connected with a war which, for the Soviet Union, was quite unavoidable. If there had been the slightest doubt that war might possibly be avoided, at least some commanders here and there would have remained at their posts.

Nor were these actions in any way preparations for a defensive war. In a lengthy defensive war, not all the commanders are sent off to the enemy frontier. Somebody stays behind in those territories where the enemy might suddenly appear. It is also absolutely essential in a prolonged defensive war that generals and real soldiers, and not policemen, remain in the most important industrial areas and transport centres, in order both to defend them and to ensure that the full potential of these great territories in the heartland of the country is fully and properly used to meet the needs of war.

There is only one circumstance in which the generals would have nothing to do in these industrial centres. That would be where the Soviet High Command was planning a sudden war on enemy territory, relying on reserves which had been mobilized before the war began, rather than on armaments to be produced in the course of it. In that event, their place would be on the enemy frontier.

Lieutenant-General K. F. Telegin himself makes the position quite clear: 'Insofar as it was supposed that the war would be fought on that enemy territory which, in the pre-war period, bordered the district, stockpiles of mobilized reserves of arms, equipment and ammunition were transferred to the military districts on the frontier.' (K. F. Telegin, *op. cit.*)

CHAPTER 24

The Black Divisions

*Stalin does not hesitate to use force on
an unprecedented scale.*

TROTSKY

(BO, Nos. 79-80, 1939.)

The main similarity between the First and Second Strategic Echelons was that the most powerful armies in their complements were deployed not against Germany but against the Romanian oilfields. The main difference between them was the colour of their uniforms. The colour of the First Strategic Echelon was the khaki of the tunics worn by millions of soldiers. Khaki was the dominating colour in the Second Strategic Echelon as well, but it had an abundant admixture of black.

I once had occasion to be present at a meeting with the retired General F. N. Remezov, who headed the 20th Army. A conversation was going on among members of his circle. No outsiders were present, so it was fairly frank. His listeners were officers and generals of the district headquarters, who knew their subject very well. They began to argue. At the height of the argument, a bold colonel with a sharp tongue put the question directly to General Remezov: 'Why do the Germans call the 69th Rifle Corps of your 20th Army the "black corps" in their documents?' General Remezov did not give an instructive reply. He deflected everything at the 56th Army, which he was later to command, saying that because of a shortage of grey military greatcoats, some of its divisions had to wear black railway overcoats. That did happen, but in December.

Remezov clearly evaded giving an answer. He was being asked about June 1941, when there were no shortages, and when it would have been too hot for soldiers in battle to run about in a greatcoat. Many soldiers in the 69th Rifle Corps wore black uniforms *in summer*. There were sufficient numbers of these soldiers to draw the attention of German military intelligence, who then unofficially called the 69th Corps the 'black corps'.

This was not the only corps of its kind. The 63rd Rifle Corps of the 2nd Army is also referred to in German documents as a 'black corps'. Komkor Leonid Grigoryevich Petrovsky, who commanded the 63rd Rifle Corps, was an outstanding military leader by any standards. He took part in the storming of the Winter Palace when he was fifteen, went through the entire Civil War and was seriously wounded three times. He finished the war as a commander of a regiment at the age of eighteen. When he was twenty, he passed out from the Academy of the General Staff in brilliant fashion. He commanded the best units in the Red Army, including the 1st Moscow Proletariat Rifle Division. At the age of 35 he was deputy officer commanding the Moscow Military District.

In battle, Komkor Petrovsky showed himself to be a military leader of strategic dimensions. He was given the rank of lieutenant-general in August 1941 and was appointed to command the 2nd Army. At that moment, the 63rd Rifle Corps, after much fierce fighting, found itself surrounded. Stalin ordered him to leave the corps and to take command of the army immediately. Petrovsky requested that this order be delayed for a few days, and sent back the aircraft sent to collect him full of wounded soldiers. Petrovsky extracted his black corps from its encirclement, and having done that, he went back into the enemy rear area to bring out another division from the encirclement. This was the 154th Rifle Division, under the command of Kombrig Ya. S. Fokanov. While he was breaking out, Petrovsky was fatally wounded. The German troops who found Petrovsky's body on the field of battle were ordered by their High Command to bury the Soviet general with full military honours. A large cross was erected over his grave bearing the inscription in German, 'Lieutenant-General Petrovsky, Commander of the Black Corps'.

Soviet sources confirm this unusual gesture. The operations of the 63rd black corps may be read about in detail in the *Military Historical Journal* (VIZH 1966, No. 6, p. 66) The *Soviet Military Encyclopedia* (Vol. 6, p. 314) confirms the accuracy of that article. References to Petrovsky's black corps may be found in Lieutenant-General of Artillery G. D. Plaskov's book, *Pod Grokhot Kanonady* (Voenizdat 1969, p. 163)

German intelligence also noticed the unusual black uniforms in other armies belonging to the Second Strategic Echelon. When these uniforms began to predominate over the usual green ones, regiments, divisions, and sometimes entire corps were referred to as 'black'. The 24th Army of the Second Strategic Echelon, which had secretly been moved from Siberia, was no exception. The Germans gave the name 'black' to some of its regiments and divisions during the fighting. But even before the divisions and corps of this

army joined in battle, some very interesting things were happening. At the end of June, the 24th Army was on the move across thousands of kilometres of railway track. Its commanding officer, Lieutenant-General Stepan Andreyevich Kalinin, was already in Moscow trying to solve the problem of how to feed it. He later recalled how he was received by the secretary of the Moscow Municipal Committee of the Party:

The secretary of the Moscow Municipal Committee rang up the People's Commissariat for Internal Affairs.

'The comrade with whom I have just been talking,' explained the Municipal Committee secretary, when he had hung up, 'had considerable experience in organizing food catering. He was doing this type of work for a long time when the Volga-Moscow Canal was being built. He will help you.'

About twenty minutes later the tall stately figure of a commander of the NKVD troops came into the secretary's office. He wore three diamond-shaped badges on the collar of his soldier's blouse, which was pulled in round the waist by a tight belt. We quickly came to an agreement with him about everything. (*Razmyshleniya o Minuvshem*, Moscow Voenizdat 1963, pp. 132-133)

It is a pity that General Kalinin is shy about naming the secretary of the Moscow Municipal Council and the smart, tightly belted visitor with the three diamond-shaped badges.

After the very first battles, the 24th Army fell into the right hands. Its command was taken over by NKVD Major-General Konstantin Rakutin. And Lieutenant-General S. A. Kalinin returned to Siberia on Stalin's personal orders. Not to command the Military District, which was still abandoned, but to form ten new divisions.

The formations were to be set up in places where there had never been any units at all before. I had visited these places and got down to work.

My first excursion was to one of the Siberian towns. Some years before the war, a small town of hutments for lumberjacks had been built there in the backwoods of the forests. This was used to billet units of the formation which was being set up.

Impassable taiga surrounded the town almost on all sides. (*Ibid*, p. 182)

Everything one needs to know about 'the small town of hutments for lumberjacks' is contained in the three volumes of Alexander Solzhenitsyn's *GULAG Archipelago*. Ten new divisions (more than 130,000 men) were set up in the Siberian Military District, not in places where military units had been previously, but in these 'small towns of hutments'. It may be argued that concentration-camp prisoners were not, of course, being turned into soldiers. General Kalinin was simply using the empty hutments to quarter the reservists who were arriving, and here they would be trained and turned into soldiers. Very well, let us accept that. Where then did the 'lumberjacks' go in that case? Why was the small town (and there was not just one) empty? The simple answer is that General Kalinin filled the ranks of the 24th Army with 'lumberjacks' *before the war* and prepared it in secret to be sent off westwards. That is why the regiments and divisions in this army, and in all other armies of the Second Strategic Echelon, wore black. The 'lumberjacks' were frequently not even re-clothed in military uniform. That is why the army which Kalinin secretly transferred to the western part of the Soviet Union was maintained by the Chief Directorate of Camps, or GULAG, of the People's Commissariat for Internal Affairs, and not by the Board for Organization of the Rear of the General Staff of the Workers' and Peasants' Red Army. That is why Stalin placed Rakutin, a pure-blooded Chekist at the head of the 24th Army instead of the half-Chekist Kalinin. He was the one who knew best how to deal with 'lumberjacks'.

Stalin is widely known to have cleared out the GULAG during the war, by sending everyone who was capable of carrying arms to the front. Sometimes, due to lack of time or shortage of uniforms, the labour-camp prisoners were sent to fight at the front wearing their own clothes. In theory, there was no great difference: the same imitation leather boots, the same ear-flapped fake sealskin hat for winter, and a jacket, which only differed from the soldier's in its colour.

A belief persists, although nobody knows where it came from, that when Hitler attacked, Stalin sent the labour-camp prisoners to the front to 'expiate their guilt'.

Meanwhile, the German troops first encountered the black divisions and corps at the beginning of July 1941. These had begun their movements to the western frontiers of the country on 13 June 1941. The formation of the armies of the Second Strategic Echelon, which embraced all these black divisions and corps, began in June 1940, when Hitler turned away from the Soviet Union by removing almost all his divisions from the Soviet frontier.

Each army belonging to the Second Strategic Echelon was formed with the special idea that they would then make a sudden appearance on the western frontier. Each army was formed on the route of the greatest arterial railway line. Each one was set up in the area of concentration camps. The inmates of these camps were trained to observe order, they led an undemanding existence, and it was easier to pick them up from the camps than from the villages. So they were all rounded up and organized into brigades. But the main thing was that had the men in the villages been taken, it would not have been possible to avoid rumours about mobilization and war. It was precisely to avoid such rumours that the TASS statement was written.

Many years later, books are still being written and songs composed about that period. Here is a fragment by Vladimir Vysotsky:

The gates, new prisoners arriving,
The glass-framed epitaph is blunt,
When to our memory proclaiming
They all went off to fight the front.

Mikhail Demin, the former criminal, wrote that 'almost the whole of Rokossovsky's army consisted of inmates of the labour camps'. (*Blatnoi 'Rusika'*, New York 1981, p. 26)

Rokossovsky commanded only one army, the 16th, in his lifetime. He forgot to say in his memoirs of what it consisted. This forgetfulness is typical of him. He begins his memoirs with the words, 'In the spring of 1940, I was in Sochi [a famous Black Sea resort] with my family,' forgetting to say that before that he had been in the GULAG. Later in the book, Rokossovsky says in passing that 'life has convinced me that one can even trust a man who at some time has allowed himself to break the law. Give such a man the chance to atone for his guilt and you will see that the good in him will come to the surface, and love for the Motherland, for his

people, and his longing to return their trust at whatever the cost, will make a courageous fighter of him.' (Marshal of the Soviet Union K. K. Rokossovsky: *Soldatsky Dolg*, Moscow Voenizdat 1968, p. 136)

This is a tacit admission that Rokossovsky had had sufficient opportunity to become convinced that a soldier could be made out of a labour-camp prisoner. But that is not the main point. What is important is that Stalin gave the labour-camp prisoners 'the opportunity to atone for their guilt' and 'become courageous fighters' *before Hitler attacked*. Armies specially adapted to recruit labour-camp prisoners into their ranks as cannon fodder were being raised even before the planned Operation Barbarossa was heard of. The 16th Army, which was the precursor of the Second Strategic Echelon, was formed on the Trans-Siberian Railway for the purpose of rapid transportation westward; and in Trans-Baikal because there was an adequate number of labour-camp inmates available. A penal army had existed there even before Rokossovsky arrived in August 1941. Before he arrived it was run by another general who had also been a victim of the Great Terror. This was Mikhail Fedorovich Lukin, who was to distinguish himself in heavy fighting at Smolensk. Gravely wounded, he was taken prisoner, and had a leg amputated. When he refused to co-operate with the Germans, he suffered four appalling years in German concentration camps. After being liberated from the German camps, he was sent once again to the GULAG.

The German High Command's encounter with Lukin's 16th Army at the end of June 1941 came as a complete surprise, as did the existence of the entire Second Strategic Echelon. It is for that reason that so many documents about this encounter have been preserved in German records. Anyone who so wishes can find many hundreds of photographs in these archives of Soviet soldiers from the Second Strategic Echelon being captured. There, among all the young lads, one may glimpse now and again the face of a man who has clearly been hardened by life, a man wearing semi-military uniform. Sometimes he is wearing a green military jacket without any badges of rank. But even the green military jacket does not make him look like a soldier. Each one of these men has strong calloused hands, a shaven head and emaciation in his face. These men had not yet passed through the *German* concentration camps. Senior officers such as Rokossovsky came into the army from the GULAG having taken the precaution to fatten themselves up in Sochi; but Sochi passed these poor fellows by.

Given that the German Army came across divisions and corps made up of labour-camp prisoners at the beginning of July, and if these divisions and corps formed part of armies which came from distant provinces

in the Urals, Siberia and Trans-Baikal, it means that Stalin put arms into the hands of labour-camp prisoners before 22 June 1941.

I do not now what German military intelligence knew in the first half of June, but let us assume that it knew very little — no more than the fragments which are known to us today:

1. Some armies were secretly moving towards the western frontiers of the Soviet Union.
2. These armies consisted of a fixed number of soldiers, sometimes entire division, each with a complement of some 15,000 men, and even entire corps, each with more than 50,000 men clad in unusual black uniforms similar to those worn in prison.
3. At least one of these armies was completely fed and maintained by the GULAG of the NKVD.
4. The Soviet government publicly and categorically denied in the TASS statement that there was anything unusual in these troop movements or in their mass character, speaking simply of 'normal training exercises'.

How was the head of German military intelligence to interpret the facts before him? There was, of course, only one interpretation: they must attack Stalin, otherwise they would be his victims.

CHAPTER 25

The *Kombrigs* and the *Komdivs*

*Only he who has first conquered his own
people can overcome a strong enemy.*

SHAN VAN, 5th century B.C.

We began the story about the black divisions and corps with the 63rd Rifle Corps of the 21st Army. Mention was made there of Komkor Petrovsky and Kombrig Fokanov. Why were they not generals? The answer is simple. In the black corps and divisions it was not just the soldiers and officers, but also the senior commanders, who were veterans of the 'small towns of hutments for lumberjacks'.

The military ranks of *kombrig*, *komdiv*, *komkor* and *koman-darm* were in use in the Red Army for senior command staff officers before 1940. Diamond-shaped badges on uniform collar tabs were used to distinguish the different ranks — one badge for a *kombrig*, two for a *komvid*, three for a *komkor*, and four for a *komandarm*. In May 1940, when Stalin was putting his senior command staff in order, he gave new titles of rank in the generals' series, ordered that generals' uniform trousers should have side stripes and, as insignia, that they should wear stars instead of diamond-shaped badges. The new ranks of major-general, lieutenant-general, colonel-general and general of the army were in no way connected with old military ranks. A Government Commission carried out a complete re-grading of the entire senior command staff, in the course of which many *kombrigs* became colonels, so that they were in effect demoted

to the level they were at several years before. Some *kombrigs* became major-generals, and Kombrig I. N. Muzychenko became a lieutenant-general. Many *komandarms* became colonel-generals, although some were demoted to lieutenant-general. But Komkor G. K. Zhukov was given the highest general's rank, that of general of the army. One little known fact, incidentally, is that Zhukov was the first officer of the Red Army to be given the rank of general. In all, 1056 senior commanders were given the military ranks of general and admiral in June 1940.

The introduction of these generals' titles was Stalin's offering of honey-cake after the great thrashings of 1937 and 1938. Why was Comrade Stalin being so kind? Because he was planning to set them to practise their trade in the foreseeable future. Had it been otherwise, he would have been in no hurry with the honey-cake.

But one thousand generals was not enough for Stalin. Divisions were being raised in increasing numbers, corps and armies were being formed. Colonels were being put into generals' posts. At one point there were no fewer than one hundred colonels holding generals' posts, commanding divisions; we have already encountered Colonel I. I. Fedyuninsky in the post of commander of the 15th Rifle Corps of the 5th Army.

There were not enough commanders either. As long as Hitler stood facing him, Stalin could get by with available personnel. But as Hitler turned his face westwards, then Stalin found himself in great need of commanders of senior rank. That explains why the prison wagons were speeding towards Moscow. After arrival, former commanders who had passed through the GULAG were met with politeness in Lubyanka jail, where it was explained that there had been a mistake. Criminal proceedings would be stopped, and previous convictions expunged. The commanders then hastened to Sochi, and from there to the colours.

Not every commander was treated with the same respect. Some were given a general's rank, including Major-General Rokossovsky, the future Marshal of the Soviet Union. But most of those who were released from prison were left with their old military rank of *kombrig*, *komdiv* or *komkor*. This brought about a strange situation in the Red Army. There were two parallel systems of military ranks for the senior command staff, two systems of badges of rank, and two different forms of dress. Some commanders went about proudly wearing their stars, striped pants and smart dress uniforms while others, doing exactly the same work, wore only their modest little diamond-shaped badges.

One method used by the Chekists in Kiev during the Red Terror has been described by the Russian historian, S. P. Mel'gunov, and confirmed by documents. A prisoner who refused to answer questions would without further ado be placed in a coffin and buried. He would then be dug up, and the interrogation would continue.

Stalin did much the same thing in the 'pre-war period'. Thousands of commanders fell into the hands of the GULAG during the years of the Great Purge. Some of them had been condemned to death, others given

lengthy prison sentences which they were serving at Kolyma. According to many witnesses (for example, *Kolyma Stories*, 1978, by V. Shalamov) life there was by no means preferable to being shot. And now here were people who had already said goodbye to life, being transported in comfortable railway carriages, being fed and fattened in health centres reserved for members of the government, being given back their former authority and allowed an opportunity to 'expiate their guilt'. However, the rank of general was not conferred permanently, and carried no guarantees . . . Can we imagine how all these *kombrigs* and *komdivs* were bursting to get down to work?

Stalin's calculation was correct. Many of those who were released were bursting to go into action and prove that they were worthy of trust. These included Komdiv Grigory Alexeyevich Vorozheikin, who was put in charge of the air arm of the 21st Army of the Second Strategic Echelon. He distinguished himself in the initial battles in July 1941 and was granted the rank of air major-general. By August he had become Chief of Staff of the Air Forces of the Red Army. He attained a new rank every year until he became a marshal in 1944.

Kombrig Alexander Gorbатов, released in March 1941, was given the post of deputy commander of the 25th Rifle Corps of the 19th Army, which formed part of the Second Strategic Echelon. He rose to the rank of general and to the post of officer commanding the airborne assault troops of the Soviet Army.

This is how he describes his release:

My wife had been to the NK VD, and was on wings when she left there. She said that they had received her very well, spoke politely, were interested in how she was managing to live, did she need help with money . . .

On the night of 5 March 1941 at two o'clock in the morning, an investigator drove me in a small car to friends of mine in Komsomorskaya Square. He dropped me and politely took his leave.

'Here is my telephone number. If you need anything, ring me at any time. You can count on me to help you.'

Like a relic, I was carrying along a bag containing clothes, galoshes and sugar lumps which were black as coal, and dried biscuits which I had kept should I fall ill. (*Gody i Voiny*, Moscow Voenizdat 1965, pp. 168-169)

Kombrig Gorbатов, like many others, was released on a carefully calculated timetable: a month's leave in a health centre before acceptance for duty. By the time the TASS report was published, the gallant *kombrig* was secretly on his way westwards with his 'Annushkas'.

As a true labour-camp prisoner, Gorbатов collected 'souvenirs' of the GULAG. Luckily for him, he did not need them again. Others were not so fortunate. Kombrig I. F. Dashichev put his snow boots on for the second time. He was released in March 1941, only to be imprisoned again in October. He remained in the GULAG until at least 1953.

Kombrigs, *komdivs* and *komkors* were also used to reinforce the First Strategic Echelon. Kombrig M. S. Tkachev, for example, was posted to the 109th Rifle Division of the 9th Special Rifle Corps; Kombrig I. P. Ivanov was appointed Chief of Staff of the 6th Army; Komdiv A. D. Sokolov, Commander of the 16th Mechanized Corps of the 12th Army; Komdiv G. A. Burichenkov, officer commanding the southern zone of the anti-aircraft defences; Komdiv P. G. Alekseev, officer commanding air forces, 13th Army; Kombrig S. S. Krushin was made Chief of Staff for the Air Force in the North West Front; Kombrig A. S. Titov, head of artillery in the 18th Army, and many more.

In addition, *kombrigs* and *komdivs* were used to fill the gaps left in the hierarchies of the military districts when the Second Strategic Echelon moved off to the western border. Kombrig N. I. Khristofanov became military commissar for the Stavropol' Region; and Kombrig M. V. Khripunov, a chief of branch in the Moscow Military District. The headquarters, as we saw, had been occupied by Chekists with little understanding of military matters after all the commanders had left for the Romanian frontier. So poor old Khripunov was summoned from the GULAG to help them.

But even so, most of the *komdivs*, *kombrigs* and *komkors* were earmarked for the Second Strategic Echelon. It is here we find Komkor Petrovsky. We remember that his last post had been deputy officer commanding the Moscow Military District. After this he was imprisoned. He was released in November 1940 and ordered to form the 63rd Rifle Corps. This is where the black corps began. Of the three divisions in the corps, two were commanded by Kombrigs Ya. S. Fokanov and V. S. Rakovsky. Colonel N. A. Prishchepa commanded the third

division. He was not a *kombrig*, although he had also been a prisoner. There were majors, captains and lieutenants too.

The neighbouring 67th Corps of the same army was full of *kombrigs*. There was even a *kombrig* at the head of the corps, F. F. Zhmachenko, who later became a colonel-general. Look at any of these armies being secretly moved from the depth of the country, and everywhere you will see hordes of *kombrigs* who had just been released. There were two corps in the 22nd Army with a *kombrig* in each - Povetkin of the 51st Corps and I. P. Karmanov, of the 62nd. The chiefs of staff, of artillery, of engineers, and of any other service, were all officers just released from prison. Two divisions in this army consisted predominantly of 'lumberjacks', with commanders from the same milieu - Kombrig Ya. S. Adamson of the H2nd Rifle and Kombrig A. I. Zygin of the I74th.

The process of releasing *kombrigs*, *komdivs* and *komkors* was begun before Operation Barbarossa was known about, and peaked at the moment when German troops left for France. Having forced a corridor through the neutral states which stood between him and Germany, Stalin now offered a 'second birth' to an enormous number of commanders who had been condemned to a rapid or slow death in the camps. These people had once held arms and great power, but every one of them had become a prisoner under sentence of death and was now burning with a desire to get back to the heights from which Stalin had toppled them. While Stalin officially reassured Germany that nothing important was happening, these officers - at the head of vast armies of fellow ex-convicts - were secretly heading for the frontier.

CHAPTER 26

Why the Second Strategic Echelon was Formed

Mobilization is war, and we do not contemplate any other interpretation.

Marshal B. M. SHAPOSHNIKOV

(Vospominaniya M., Voenizdat 1974, p. 558)

Shortly after the first German troops began to invade the Soviet Union, General I. V. Tyulenev was having a conversation in the Kremlin with Zhukov. 'I reported it to Stalin', Zhukov said, 'but at first he didn't believe it, and thought it was a provocation by some German generals.' (*Cherez Tri Voyny*, Moscow Voenizdat 1960, p. 141) This creates a serious contradiction for communist historians who argue that Stalin carried out the largest regrouping of troops in history because he sensed that a German attack was imminent. Even *after* the attack had actually begun, Stalin refused to believe that it was happening.

Moving the Second Strategic Echelon was not a reaction to what Hitler was doing. This vast railway operation needed long and detailed preparation and accurate preparatory planning. Marshal of the Soviet Union S. K. Kurkotkin states that the General Staff passed all the necessary documents on the troop transfers to the People's Commissariat for railways on 21 February 1941. (*Tyl Sovetskoykh Vooruzhenykh Sil v Velikoi Otechestvennoi Voine*, Moscow Voenizdat 1977, p. 33) But the General Staff was asked for more time to prepare these documents with due thoroughness. They would have to tell the railwaymen what transport to provide, how to camouflage the loads and the movements, what routes to take, and where to prepare for massive troop disembarkations. In order to have all this ready, the General Staff would have had to have known the details of troop movements in advance. It means we must go further back to find the decision to set up the Second Strategic Echelon, and where the planning began for its transfer and for its combat use.

In fact, the process was set in motion by a Politburo decision, and began on 19 August 1939 - before Hitler had invaded Poland or gone to war with Britain and France. At no time did it falter, but gradually gathered

momentum. Let us take just one Military District, the Urals, as an example. Two new divisions were formed there in September 1939, the 85th and the 159th. On 21 June 1941, we find the 85th right on the German frontier near Augustow, in a sector where the NK VD was cutting down the barbed wire. We also find the 159th Division right on the frontier in Rava-Russkaya, where it was part of the 6th (heavy shock) Army. The 110th, 125th, and 128th Rifle Divisions were formed in the same Urals Military District at the end of 1939, and later we find each one of them on the German border. Not only that, Soviet sources tell us that the 125th was 'directly on the frontier' of East Prussia. The Urals District raised many more regiments and divisions, and they were all moved quietly and without fuss nearer to the borders.

While the Second Strategic Echelon still did not officially exist, the senior Soviet military leadership was working out methods by which the troops of the First and Second Strategic Echelons could co-operate. In the second half of 1940, General D. G. Pavlov held a meeting with the officers commanding the armies and the chiefs of staff in the Western Special Military District. Among all the thousands of Soviet generals and admirals, D. G. Pavlov was fourth highest in seniority.

The Western Special Military District was making grandiose plans to hold command-staff exercises. Plans of action were worked out for commanders, headquarters, and communications systems to be used in the initial period of war. In the course of the exercises, the Soviet headquarters had to move to the west in exactly the same way as they would prepare to do as war began. 'But these headquarters which are right on the frontier?' Colonel-General Sandalov, Chief of Staff of the 4th Army, asked perplexedly. 'Where will they move to?' (L. M. Sandalov, *Perezhito*, Moscow Voenizdat 1966, p. 65) Nobody keeps headquarters 'right on the frontier' when preparing for a defensive war, but Soviet headquarters had been moved there, and stayed there, immediately after the common border with Germany had been established. The reaction of this chief of staff of an army on the frontier is also interesting. In his mind the order to move was only associated with the concepts of 'move to the west', and 'move across the frontier'; it did not occur to him that in a war the headquarters could be moved elsewhere.

In addition to the commanders of the First Strategic Echelon, the meeting was also attended by highly-placed guests from the Second Strategic Echelon, led by General I. V. Tyulenev, officer commanding the Moscow Military District. Taking advantage of Tyulenev's presence, General D. G. Pavlov explained to

Lieutenant-General V. I. Chuikov, the officer commanding 4th Army and a future Marshal of the Soviet Union, the objectives of the Second Strategic Echelon:

'When the troops get here from the internal military districts,' said Pavlov, 'and when a density has been achieved in your army's zone of seven and a half kilometres per division, then there can be movement forward without any doubts about success.' (*Ibid*)

The presence of General Tyulenev at this meeting is very significant. He already knew in 1940 what his role would be in the initial period of war. This was to report with his headquarters to the frontier military district, when the First Strategic Echelon would cross the state frontier. This Soviet plan was changed in February 1941 under pressure from Zhukov, who had by then taken over the General Staff. In the changed version, instead of going to the German frontier, General Tyulenev and his headquarters had to move secretly to the Romanian frontier, for that was where the main efforts of the Red Army were to be concentrated.

The troop density of seven and a half kilometres per division which the Soviet generals were using is the standard one for an offensive. At that time a division would have been allocated a stretch of terrain some three to four times greater for defensive operations. This same meeting also discussed how the movement of Soviet troops to the frontier could be camouflaged. 'Movements . . . of new divisions,' the meeting decided, 'can be carried out under the guise of training refresher courses.'

By 13 June 1941, 77 divisions from the internal military districts were headed for the Soviet western frontiers 'under the guise of training refresher courses'. In that situation, Hitler did not sit back and wait. While the Soviet generals were establishing 'the regulation density of seven and a half kilometres per division', he struck the first blow.

After Germany had begun its preventive war, the Second Strategic Echelon, like the First, was used for defence. But this in no way means that this was the purpose for which it had been created. General Mikhail Ilyich Kazakov said of the Second Echelon that 'after the war began, cardinal changes had to be made in the plan governing its use'. (VIZH1972, No. 12, p. 46)

Major-General Vassily Ivanovich Zemskov expressed himself more exactly: 'We were compelled to use these reserves for defence, and not in accordance with the plan for an offensive.' (VIZH 1971, No. 10, p. 13)

General of the Army Simion Pavlovich Ivanov outlines the original plan behind the formation of the Second Strategic Echelon:

If the troops of the First Strategic Echelon were to succeed ... in carrying military operations on to enemy territory even before the main forces had been deployed, the Second Strategic Echelon would have to augment the efforts of the First Echelon by developing a response attack as laid down by the general strategic plan. (*Nachal'nyi Period Voiny*, Moscow Voenizdat 1974, p. 206)

The reader must not be misled by the term 'response attack' in this sentence. Its meaning, as used here, may be understood by glancing at the Winter War with Finland. Almost 50 years later, the Soviet version is still that Finland attacked, and that the Red Army only delivered a 'response attack'.

Lieutenant-General S. A. Kalinin tells of the mood which prevailed then in the Second Strategic Echelon. Before the secret troop movements began, he was training troops in the Siberian Military District for operational action. During the exercises, the general heard this opinion expressed by a very junior officer: 'Those fortifications there will not be used, that's for sure. We're getting ready not for defence but attack, you see. We'll hit the enemy on his own territory.' (*Razmyshleniya o Minuvshem*, Moscow 1963, p. 124) General Kalinin relayed the young officer's words with a certain irony: how naive can one be, he implied. But he did not say from where the young officer had got such ideas. If the young officer was wrong, General Kalinin should have corrected him, and then pointed out to all the commanders that there was something which the junior officers were failing to understand, and that was that the orientation of the training was not quite right. He then should have immediately questioned the commanders in the adjacent battalions, regiments and divisions, and if he then found that this 'incorrect' opinion was being repeated, he should have issued a stern command throughout the 24th Army ordering that the orientation of the training be corrected. But General Kalinin did not do this, and the troops continued to be trained 'to fight on enemy territory'.

It was not the fault of the young commanders that they were not being trained for defence. It was not even the fault of General Kalinin. He was only the officer commanding one army, when all armies were being trained to fight 'on enemy territory'. He reveals his own attitude to the issue in an interesting anecdote. After

he had handed over the command of the 24th Army to General K. Rakutin, Kalinin returned to Siberia, where he trained ten new divisions 'in the small towns of hutments for lumberjacks'. 'From where do I begin?' he asked himself.

On what has the main attention of the troops to be concentrated when they do their training, on defence or attack? The position at the fronts was still tense. Red Army troops were continuing to fight heavy defensive battles.

Experience gained in the fighting showed that we were far from adept on occasions when constructing our defence. Defensive positions were frequently ill-equipped in the engineering sense. Sometimes there was not even a trench system at the first position. The battle formation of the defenders often consisted of only one echelon and a small reserve, which diminished the troops' resistance. In many cases the men were badly trained in anti-tank defence, and the notorious tankophobia, or fear of tanks, was present among the troops.

But at the same time the thought occurred - 'We shall not always be defending ourselves. Attack - that's the compulsory thing . . .

'What is more, defence is not considered, nor has it ever been, to be the main form of military action . . . this means that the troops must be trained for offensive fighting . . .' I shared this view with the commanders. We all came to the same conclusion. The principal efforts in training must be directed at carefully working through offensive action. (*Ibid*, pp. 182-183)

The first duty of the state and its army at the time was to stop the enemy, if only at the walls of Moscow. Yet it was obvious to everyone that the Red Army was not ready for defence - it was not even preparing for it.

Even after the German attack, when the Wehrmacht was threatening the very existence of the communist regime, General Kalinin was going on training his troops only to attack. What had he been training them to do before the German invasion began?

As a result of German preventive action, the Second Strategic Echelon had to be used for defence, and not for its intended purpose. I have sufficient documentation to establish the role which had been assigned to it by the Soviet war plans. Here, as in the First Echelon, each army had its own unique individuality, and its own personality and character. Most armies travelled light, like a strong frame which had to be filled in after it had arrived in the forests in the western parts of the country and been deployed there. The standard complement of the armies in the Second Strategic Echelon was two rifle corps, each with three rifle divisions. This was not a shock army, but an ordinary one with a reduced complement.

On arrival in the western areas of the country, each army immediately set about completing its mobilization and supplementing its divisions and corps. It was quite logical that most of the armies in the Second Strategic Echelon did not have mechanized corps with large numbers of tanks. First, such corps were set up mainly in the western parts of the country. If the need arose, they did not have to be moved westwards from provinces deep in the Urals and Siberia. It would be more simple to reinforce them where they already were by light armies arriving from these distant provinces. There was an even better alternative. This was to use by far the greater part of the mechanized corps in the first surprise strike, in order to make it an extraordinarily powerful one; then to throw the Second Strategic Echelon into battle, and transfer to its light armies all the tanks which had survived the first operations.

There was, however, an exception among the armies of the Second Echelon. The 16th was manifestly a shock army. Its complement included a full-strength mechanized corps which had over 1,000 tanks. In addition, the detached 57th Tank Division, under the command of Colonel V. A. Mishulin, was moved westwards along with this army. The 57th Tank Division was under the operational command of the officer commanding the 16th Army. Taking this division into account, the 16th Army had more than 1,200 tanks, and on full complement this figure must have exceeded 1,340.

The 19th Army was even more powerful. This had been moved secretly from the Northern Caucasus. Its complement included four corps, including the 26th Mechanized Corps. There is sufficient evidence to show that the 25th Mechanized Corps, under the command of Major-General Simion Krivoshein, had also been earmarked for the 19th Army. This clearly was a heavy shock army. Even its rifle corps were organized in an unusual way and were headed by very high-ranking commanders. The 34th Rifle Corps, under Lieutenant-

General R. P. Khmel'nitsky, for example, had four rifle and one mountain rifle divisions on its complement, as well as several heavy artillery regiments.

The presence of the mountain rifle divisions in these armies was not accidental. The 19th Army, the most powerful in the Second Strategic Echelon, was secretly deployed, but not against Germany. The whole Soviet grand design is revealed here- the most powerful army in the First Strategic Echelon was deployed against Romania; and the most powerful army in the Second Strategic Echelon, right at its back, against Romania as well.

The 16th Army, the second most powerful in the Second Strategic Echelon, was deployed alongside. It could also have been used against Romania and its vital oilfields, but it was more probable that the plan was to use it against Hungary alongside the 26th (shock) and the 12th (mountain shock) Armies, cutting off the oil from its users.

Hitler disrupted this deployment with his invasion. The 16th and 19th Armies had to move immediately to Smolensk, thereby putting back the 'liberation' of Romania and Hungary by several years.

Immediately after the partition of Poland in the autumn of 1939, a great number of Soviet troops were transferred from permanent garrisons on to the new frontier. The new territories, however, had not been adapted to the stationing of large numbers of troops, especially modern troops equipped with a great deal of weapons and technical equipment.

The official *History of the Second World War* records how 'the troops in the western frontier districts experienced great difficulties. Everything had to be built and equipped anew, bases and supply points, airfields, the road network, junctions and lines of communication . . .' (1973-77, Vol. 4, p. 27)

The official *History of the Byelorussian Military District* paints a similar picture:

The displacement of formations and units of the District to the western areas of Byelorussia gave rise to not inconsiderable difficulties . . . The personnel of the 3rd, 4th and 10th Armies had to build and repair barracks, depots and camps, and equip training grounds, firing ranges and tank training areas. The troops were under great strain. (KBVO, Moscow Voenizdat 1983, p. 84)

General Sandalov says that in 1939-40, depots, wooden huts and any buildings at all were used for billeting troops. But the troops kept on coming. 'There was a great pile-up of troops in Brest-Litovsk . . . four-tiered bunks were fitted up in the lower floors of barrack buildings.' (*Na Moskovskom Napravlenii*, Moscow Nauka 1970, p. 41)

Lieutenant-General V. N. Kurdyumov, head of the Combat Training Directorate of the Red Army said at a command staff meeting in December 1940 that the troops in the new regions were often compelled to do domestic work instead of doing combat training. At the same meeting, Lieutenant-General Ya. N. Fedorenko said that almost all his tank units had moved their deployment garrisons three or four times towards the border during 1939-40. The result was that more than half of the units who had gone to new locations had not had any ranges to train on.

In 1939 and 1940, at the cost of strenuous effort, the enormous number of troops belonging to the First Strategic Echelon accommodated and quartered. But then, in February 1941, slowly at first and then at an ever increasing speed, the transfer began of the huge numbers of troops in the Second Strategic Echelon.

At that point, a change of considerable importance took place. *Soviet troops ceased to concern themselves about how they would spend the following winter.* All the troops of the First Strategic Echelon left their dug-outs and partially built barracks and moved directly onto the frontier. (Marshal I. Kh. Bagramyan, *VIZH* 1976, No. I, p. 62) The troops in the Second Strategic Echelon who were being moved from the interior of the country did not use the uncompleted barracks and small military centres which the First Echelon had left behind. The arriving troops did not mean to spend the winter in these places, and were in no way preparing themselves for winter. They no longer made dug-outs, they did not build training grounds or firing ranges; they did not even dig trenches.

There are many official documents and memoirs by generals and marshals to show that the troops were now quartered only under canvas. In the early spring of 1941, the 188th Rifle Division of the 11th Army's 16th Rifle Corps was being formed in the Baltic area. It took in reservists in May. The division struck a temporary summer encampment under canvas near Kozlovo-Rua, some 45-50 kilometres from the state frontier. Under cover of the TASS report, the division abandoned this encampment and moved to the frontier. Any attempt to find even a hint of preparations for winter would be bound to fail. It was the same story with the 28th Tank Division, which was being deployed nearby.

Marshal of the Soviet Union K. S. Moskalenko, who was then a brigade commander with the rank of major-general, recalls the orders given to him by Major-General M. I. Potapov, officer commanding the 5th Army:

'The formation of your brigade has begun here . . . You will take that section of forest, and build a camp . . . ' This powerful, full-strength brigade, with a complement of more than 6,000 men armed with more than one hundred heavy guns of a calibre of up to 107mm, had the camp working in three days. After this, the intensive combat training began. It went on for eight to ten hours daily, and this did not include night work, homework, arms maintenance, and weapons training. (*Na Yugo — Zapadnom Napravleny*, Moscow Nauka 1969, p. 18)

If the Soviet troops had been preparing for defence, they would have had to dig in and make a continuous line of trenches stretching from the Arctic to the mouth of the Danube. But they did not do this. If they had intended to spend another winter in peace and quiet, then, from the beginning of April, they should have been building. They did not do this either. Some divisions had left half-built barracks somewhere behind. But many divisions formed in the spring of 1941 had neither barracks nor hutments, yet they were not even making dug-outs. So where did they intend to spend the winter, if not in central and southern Europe?

Major-General A. Zaporozhchenko has left us a remarkable description of the movements of troops towards the frontier:

The concealed movement of the shock groupings up to the areas from where the offensive would begin was the concluding phase of the strategic deployment. This movement was carried out over several nights prior to the attack. The covering action for the movement was organized by forces of reinforced battalions which had been previously moved up to the frontier, and which were controlling those sectors of the front which had been allotted to the divisions, until the main forces arrived.

The redeployment of air force units to other bases began in the last days of May and was concluded by 18 June. At the same time fighter and military aircraft were concentrated at airfields up to 40 kilometres from the frontier, while bombers were put on airfields no more than 180 kilometres from the border. (*VIZH* 1984, No. 4, p. 42)

The only surprising thing about this description is the date -18 June. The Soviet air forces did not complete their redeployment to other bases on that day - they had only began it on 13 June under cover of the TASS report. So why does the general talk about 18 June? The fact is that he was speaking not about the Red Army, but about the German Wehrmacht. The same thing was happening in Germany: troops were being moved up to the frontier at night. Reinforced battalions were being sent ahead. The arriving divisions were occupying the departure areas for the offensive, or to put it more simply, they were hiding in the forests. The actions of one colossal army were the mirror image of the actions of the other. The only respect in which they failed to coincide was time. At first the Soviet troops were ahead. Then Hitler went into the lead by two weeks. He had fewer troops and had to move them over very short distances. Interestingly, at the beginning of June the German Army was in a most disadvantageous position. A great number of the troops were in military trains. The guns were in one train, the shells in another. Combat battalions were disembarked in places where there were no headquarters; and headquarters were set down in places where there were no troops. There were no communications, so that for security reasons radio stations were simply forbidden to operate until military action began. The German troops did not make dug-outs either, nor did they build ranges. The greatest similarity, however, was the massive quantity of supplies, troops, aircraft hospitals, headquarters and aerodromes, all up against the Soviet frontiers. Few people knew what was planned; that was the most closely guarded secret of the German High Command.

Everything that we have seen in the Red Army, and have taken for foolishness and idiocy, had in fact been done two weeks before in the German Army. It was neither foolishness nor idiocy, but preparation for a massive offensive.

What should have happened following the full build-up of troops belonging to the Second Strategic Echelon in the western parts of the country? The answer to this question was given long before World War II began, by the Chief of the General Staff of the Polish Army, General V. Sikorsky: 'A strategic wait cannot be continued after all forces have been mobilized and their build-up completed.' (*Budushchaya Voina*, Moscow Voenizdat 1936, p. 240). The Soviet General Staff decided that his book should be published in Moscow for the benefit of Soviet commanders. It corroborated Soviet military thought, which was firmly convinced that 'the worst thing in modern conditions is the urge to stick to waiting tactics in the initial period of war'. (*Voina i Revolyutsiya* 1931, Book 8, p. n)

Marshal of the Soviet Union Boris Mikhailovich Shaposhni-kov, Chief of the Soviet General Staff, held firm views about this.

If reservists who have been called up have to spend a long time under the colours without any prospect of war in view, the result can be a negative effect on their morale. Their combat readiness deteriorates instead of improving . . . In a word, no matter what the command, and even more what the diplomats might wish, once mobilization has been declared, the guns might start firing on their own for purely military reasons.

Thus the proposition must be considered doubtful that it is possible in modern conditions of warfare for mobilized armies to remain for a long period in a state of military peace without going over to active fighting. (*Mozg Army*, Vol. 3, GIZ, 1929)

Soviet military thinking considered then, as it does now, that 'mobilization, concentration, operational deployment and mounting the first operations are all parts of one and the same single uninterrupted process'.

(VIZH 1986, No. I, p. 15) Having begun to mobilize and thereby to concentrate troops and deploy them operationally, the Soviet command could no longer stop this process, or even slow it down. It is roughly the same thing as thrusting one's arm sharply downwards, unfastening the holster, pulling out the revolver, pointing it at the enemy and cocking the trigger all in one movement. After that, whether you like it or not, firing is inevitable, for as soon as your hand is thrust downwards, your opponent is doing the same thing just as quickly, or even more so.

In trying to answer the question of who started the Soviet -German war in 1941, communist historians apply the criterion that the guilty party was the one who fired the first shot. But why should we not apply another criterion? Why should we not turn our attention to the one who was first to begin mobilization, to concentrate his troops and to deploy them operationally? Who first reached for his pistol?

Soviet apologists argue that while Shaposhnikov - and modern Soviet strategists, for that matter - understood that the movement of troops was war, Zhukov did not. This was very far from the case. In order to understand the determination being shown by the Soviet High Command in what it was doing, we must go back to 1932, to the 4th Cavalry Division. This was not just the best division of Soviet cavalry; it was the best in the whole of the Red Army. Until 1931, this division was quartered in the Leningrad Military District in places where the Imperial Horseguards had once been. The conditions in which this division lived and trained for battle can easily be imagined. Their living conditions were nothing less than magnificent. In 1932, for urgent operational reasons, this division was moved to another, this time totally unprepared, base. Marshal Zhukov wrote that

this division was compelled to spend eighteen months building itself barracks, stables, a headquarters, living quarters, depots and an entire training base. The result was that this brilliantly trained division was turned into a bad, unskilled military unit. A shortage of building materials, wet weather and other unfavourable conditions prevented the building being completed by the time winter came. This had an extremely bad effect on the general condition of the division and its combat preparedness. Discipline became slack . . . (*Vospominaniya iRazmyshleniya*, Moscow, APN 1969, p. 118)

In spring, the best division in the Red Army was 'in a state of rapid collapse' and 'was unfit for battle'. The divisional commander was held to be chiefly to blame for this and suffered the consequences. A new commander was then sought for the division, and G. K. Zhukov was appointed to the post. It was from here

that his ascent began. Zhukov's work was closely followed by S. K. Timoshenko, the corps commander, and even by the People's Commissar for Defence himself, K. E. Voroshilov. The division bore his name and was considered to be the best. Voroshilov expected Zhukov to restore past glories to the 4th Cavalry Division. Zhukov achieved this by draconian measures, proving that he could be entrusted with any theoretically impracticable task.

By 1941, all the characters in this story had risen considerably in rank. K. E. Voroshilov was a member of the Politburo, a Marshal of the Soviet Union and chairman of the Defence Committee; S. K. Timoshenko was a Marshal of the Soviet Union and People's Commissar for Defence; and Zhukov was a full general, deputy People's Commissar for Defence and Chief of the General Staff. These three together directed the secret Soviet troop movements towards the German frontier. They knew better than we did, and not from theoretical deduction, that not even one division could be left to spend the winter in the open forest. A soldier can spend the winter in any conditions, but that was not the problem. The problem was that on the Soviet western frontiers there were no firing ranges, training grounds, tank training areas, training centres, or conditions needed for combat training. If the troops were not put into battle immediately, there would be an inevitable deterioration in their combat readiness. They knew that not even one division could be left for the winter in a place which had not been prepared in any way. They knew that culprits would be found, and they also knew what happened to culprits. But even so, they moved practically the entire Red Army to places where there was nowhere to do combat training.

The war did not begin as Stalin wanted and therefore it did not end as he had wanted either. Stalin got only half of Europe. But in order to understand what Stalin intended, let us for a moment envisage a situation in which Hitler did not attack the Soviet Union on 22 June 1941, but decided to postpone Operation Barbarossa and capture Gibraltar, for example, instead.

What would Stalin have done in that situation? He could not have turned back his massive armies. Many of the armies and corps which were set up in the first half of 1941 had nowhere to go back to, apart from the 'small towns of hutments for lumberjacks'. It would have taken many months to move the troops back, paralysed the railways and brought on an economic catastrophe. What would have been the sense of spending six months concentrating troops in secret, and then spending another six months dispersing them?

But even if a total dispersal had immediately followed the total concentration, it would have been quite impossible to complete this process before winter set in.

Nor could Stalin have left his vast armies to winter in the forests of the frontier area. An army quickly loses its fighting capability without intensive combat training. In addition, the process by which the armies of the Second Strategic Echelon were raised and moved westwards was kept, for whatever reason, a close secret by Stalin. For how long could he have been sure of preserving that secret had he left these armies with their countless troops on the border for even a few weeks?

This is the central question of this book: if the Red Army could not go back, but could not stay long in the border area either, what was left for it to do? It is a question which all communist historians are afraid to answer. But we need look no further than the opinion of a general who 'was a deputy chief of the operations headquarters in the General Staff from May 1940 onwards, and who worked on the operational part of the plan for the strategic deployment of the Soviet armed forces in the north, north-west, and western sectors'. (*Soviet Military Encyclopedia*, Vol. 2, p. 27) Everything was correct in his planning. That was why he became a Marshal of the Soviet Union only eighteen months after beginning the war as a major-general. He was one of those who was closest to Stalin. It was he, and not Zhukov, who controlled the Red Army in the last years of Stalin's life, and who fell from high rank when Stalin died.

Marshal of the Soviet Union Alexander Mikhailovich Vasi-levsky was perfectly frank in his appraisal of the situation: 'The fears that the allegedly aggressive intentions of the USSR might cause a clamour in the West had to be thrown overboard. We had then reached . . . the Rubicon of war, and had to take a firm step forward.' (*VIZH* 1978, No. 2, p. 68)

In every grandiose scheme, there comes a critical point after which events become irreversible. For the Soviet Union that point was the date of 13 June 1941. After that day, war for Stalin not only became inevitable: it became inevitable in the summer of 1941, no matter how Hitler might act.

CHAPTER 27

Undeclared War

In conditions where we are surrounded by enemies, a sudden attack from us, an unexpected manoeuvre and speed will decide everything.

STALIN (Vol. 5, p. 225, 1923)

The Soviet Union had five military districts on its borders where troops were assembling unremittingly and in secret. All eight internal military districts had been entirely abandoned by the Soviet High Command. All armies, corps and divisions, and almost all generals and their staffs had left these internal military districts in secret for the Soviet western frontiers.

In addition to the five western frontier and the eight internal military districts, there were the Far East Front and three eastern frontier military districts: the Transcaucasian, the Central Asian and the Trans-Baikal districts.

In spite of the TASS denial of 9 May 1941, intensive preparations had been going on in the Central Asian and Transcaucasian military districts for the 'liberation' of Iran. The Central Asian district had been allotted the main role, while the Transcaucasian had been given an auxiliary part to play. As was usual, the final touch to the preparations was a large-scale exercise to be attended by the senior command staff of the Red Army. General Zhukov and his deputy Lieu-tenant-General N. F. Vatutin were to attend these exercises in May.

General Shtemenko, who was then a colonel in the Chief Operations Directorate of the General Staff, recalled the uneasy atmosphere surrounding these preparations:

The main staff of our branch set off for Tiflis at the end of May. We were reinforced by other branches . . . Just before we left, it was explained that neither the Chief of the General Staff nor his deputy could come,

and that the exercises -would be conducted by the officers commanding the troops, D. T. Kozlov in the Transcaucasian Military District and S. G. Trofimenko in the Central Asian Military District. However, the day after we reached Tiflis, Lieutenant-General Kozlov was urgently summoned to Moscow. There was a feeling that there was something out of the ordinary going on in Moscow. (General S. M. Shtemenko, *General'ny Shtab v Gody Voyny*, 1968, p. 20)

So the Transcaucasian Military District, which was a frontier one, was left without a commanding officer right on the eve of the 'liberation' of Iran. It may be argued that General Kozlov's deputy, Lieutenant-General P. M. Batov, could have taken over the command of the district. Batov, however, was otherwise engaged. Using the best troops in the Transcaucasian Military District, Batov set up the 9th Special Rifle Corps. He then transferred it to the Crimea where, in co-operation with the Black Sea Fleet, it was given intensive training in naval assault landing operations. The Black Sea Fleet also trained a division from this corps in making assault landings from warships.

The Transcaucasian Military District remained without its commanding officer and his deputy until August 1941, when General Kozlov returned to carry out the 'liberation' of Iran. Here too, Hitler had upset Stalin's plans. Because of Hitler's unforeseen actions, the 'liberation' of Iran had to be postponed for a few months. When it did take place, it had to be done with reduced forces, so the 'liberation' had to do without the planned 'radical socio-political reforms'.

General S. G. Trofimenko, the officer commanding the Central Asian Military District, had been summoned to Moscow by Stalin, and the district's headquarters had been seriously weakened and 'dispossessed like kulaks'. In March 1941, Colonel N. M. Khlebnikov was called to Moscow from the headquarters of the Central Asian Military District and appointed Commander of Artillery in the 2yth Army in the Baltic area. The 2yth Army made its first official appearance in the western part of the country in May 1941, but cadres allotted to it had gathered along the frontiers considerably earlier. Major-General M. I. Kazakov, who was chief of staff in the district and later became a full general, was also called to Moscow in the wake of Khlebnikov and many other colonels and generals. He later wrote that he had observed from the aircraft an enormous number of military trains carrying troops and war material out of Central Asia. (*Nad Kartoi Bylykh Srazheny*, Moscow Voeniz-dat 1971)

General A. A. Luchinsky (then a colonel commanding the 83rd Mountain Rifle Division) was travelling in one of these trains. He shared a compartment with Major-General (later General) Ivan Efimovich Petrov. Luchinsky's recollections of Petrov are invaluable. 'We had been summoned to the People's Commissariat for Defence. We were travelling together in the same compartment when a radio announcement proclaimed that Nazi Germany had attacked our country.' Luchinsky does not tell us why he had been summoned to Moscow, but he says of his friend General Petrov that 'He was appointed Commander of the 192nd Rifle Division not long before the war, and then of the 27th Mechanized Corps, at the head of which he too left for the front.' (VIZHI976, No. 9, pp. 121-122)

Petrov converted the 192nd Rifle Division into a mountain rifle division; both it and the 27th Mechanized Corps secretly moved to the Romanian frontier. Petrov, meanwhile, went to Moscow to be given his combat mission. We come across this procedure on more than one occasion: the 16th Army, for example, was secretly moved to the Romanian frontier, while Lieutenant-General M. Lukin, its commanding officer, was in Moscow being given his combat instructions.

Luchinsky's brief article about General Petrov paints an apparently uneventful picture. But let us look at the order in which events occurred. First of all, Petrov set up the 27th Mechanized Corps, loaded it on to military trains, and sent it off to the front. Then, when he was already on the train, he heard the announcement that Germany had started the war. The most interesting thing, however, happened several days later: the 27th Mechanized Corps was disbanded while it was travelling. In a defensive war, such purely offensive formations are simply not needed. In July 1941, all the other mechanized corps were disbanded as well. There were 29 of them in all.

This situation seems quite absurd. The 27th Mechanized Corps was on its way to war *before* Hitler attacked. But as soon as Hitler began the war the 27th Corps was disbanded even before it had encountered the enemy. This is not as absurd as it seems, however. For the 27th Mechanized Corps was being transferred from Central Asia to the Romanian frontier in order to fight, not in the war which Hitler had just begun, but in a war which should have been started by some other means.

The inescapable conclusion is that, had Hitler not attacked, the 27th Mechanized Corps would still have taken part in a war. It was precisely to do so that it was travelling to the front. By launching Operation

Barbarossa when he did, Hitler averted the war for which the 27th Mechanized Corps and 28 of its fellow corps, each with an estimated 1,000 tanks, had been created.

Travelling on trains from Central Asia along with Petrov and Luchinsky were quite a few famous commanders, and others who were destined to become so. Among them was Major-General Alexei Simionovich Zhadov, who had been commanding a mountain cavalry division in Central Asia. On the eve of the war, he was made commander of the 4th Airborne Assault Corps, and reached the front at the height of hostilities. (*VIZH* 1971, No. 3, p. 124)

If anyone tries to prove to you that Stalin gathered his generals on the Soviet western frontiers in order to repel German aggression or to launch 'counter attacks', then remind him of General Zhadov, who changed a mountain cavalry division in Central Asia for an airborne assault corps in Byelorussia. Are airborne assault corps really intended for making counterattacks or repelling aggression?

The Trans-Baikal Military District was abandoned, even though its troops were not just on Soviet territory, but in Mongolia where quite recently there had been a real war involving hundreds of tanks and aircraft, thousands of guns and tens of thousands of soldiers.

Of all the internal military districts and frontier districts in the east, the Trans-Baikal was the only one to have armies on its complement. There were two of them, the 16th and the 17th. The 17th Army was stationed in Mongolia, but in 1940 it had been 'lightened' to such an extent that the post of deputy officer commanding the army was occupied by a colonel, P. P. Polu-boyarov, because of a shortage of generals. As we already know, he too was summoned to Moscow and then posted to the North-West Front.

The other army in the Trans-Baikal Military District, the 16th, had left secretly, travelling westwards. Although rumours about the Iranian frontier were spread among the wives who had remained behind, the 16th Army commanders knew that they were going to wage war, and they also knew against whom.

When the 16th Army left, the headquarters of the Trans-Baikal Military District was also 'lightened' when many of its officers and generals were transferred to the divisions and corps of the 16th Army. Major-General

Petr Chernyshev, for instance, who commanded the 16th Army's 152nd Rifle Division, was promoted and appointed commander of the combat training branch of the Trans-Baikal Military District. But, 'when the army left, Petr Nikolaevich stated that he would "go to fight with his division", and fixed it so that he was sent back to the 152nd'. (Major-General A. A. Lobachev, *Trudnymi Doro-gami*, Moscow Voenizdat 1960, p. 147)

It was not only second-rate colonels and generals who were raked in from Trans-Baikal. Some truly great commanders were gathered from here. Among the greatest were the officers commanding the district. Although only one officer commanded the district at any one time, the post was rotated with surprising frequency. In 1940, the Trans-Baikal District was commanded by Lieutenant-General F. N. Remezov. He was then sent off to take charge of the Orel Military District, where he secretly formed the 20th Army and, under cover of the TASS report, moved it to the German frontier. After Remezov, the Trans-Baikal District was fleetingly commanded by Lieutenant-General I. S. Konev. He was then transferred from there to the Northern Caucasus Military District, where he secretly formed the 19th Army and, again under cover of the TASS report, posted it to the Romanian frontier. At this point Lieutenant-General P. A. Kurochkin (who later became a full general) took over command of the Trans-Baikal District. Before the TASS report, Kurochkin sent the 16th Army off, wishing its commanders and soldiers success in carrying out 'any order given by the Motherland'. The 16th Army had the longest road to travel. That was why it set off early, so that it could appear on the Soviet western borders at the same time as all the other armies of the Second Strategic Echelon.

And what of Lieutenant-General P. A. Kurochkin? It is no easy matter to send a whole army off in military trains in such a way that nobody finds out about it. Kurochkin completed his mission and heaved a sigh of relief. On 13 June, when the TASS report was being given out, Kurochkin was ordered to leave the Trans-Baikal District immediately for Moscow, to be given a new post. The *Red Star* newspaper of 26 May 1984 testifies that on 22 June 1941 Kurochkin was in a compartment of an express train then approaching Irkutsk . . . The Trans-Baikal Military District had been abandoned and left without a commander. The *Soviet Military Encyclopedia* (Vol. 3, p. 357) states that it was September 1941 before another commander appeared in Trans-Baikal.

Generals and officers were being transferred to the German and Romanian frontiers not only from the internal and semi-front military districts, but from a real front. A war was already taking place in the Far East. Armed skirmishes frequently grew into serious clashes, with hundreds of tanks and aircraft taking part on both sides. A full-scale war between Japan and the Soviet Union appeared to be entirely possible at the time; indeed some foreign observers regarded it as inevitable. That was why there was no military district in the Far East, but a front consisting of three armies.

At the end of 1940, the secret transfer westwards of generals and troops, in entire divisions and corps, began. Many senior commanders left the Far East Front without being replaced, or at least without worthy successors. Major-General P. T. Kotov, the chief of operations in the front headquarters, was transferred secretly westwards in this way.

Major-General P. G. Grigorenko, who was a lieutenant-colonel at the Far Eastern Front headquarters at the time, recalls that 'Ivan Stepanovich Konev, Markian Mikhailovich Popov, Vasily Ivanovich Chuikov, and many other senior military commanders were called westwards even before Shtern was.' (*Memoirs: Detinets*, New York 1981, p. 246) Popov (later to become a full general) commanded the 1st Army, while Konev (subsequently Marshal of the Soviet Union) commanded the 2nd Army. I totally reject any idea that these generals were being transferred because a German invasion had been foreseen. The war found Popov in the post of officer commanding the Northern Front on the Finnish border, while Konev moved up to the Romanian frontier at the head of his heavy shock army.

General Konev took an interesting path from his position as officer commanding an army in the Far East to a similar post in an army on the Romanian border. Konev did not travel in a straight line. He dodged and weaved. Having given up the command of the 2nd Army in the Far East in April 1941 (*Soviet Military Encyclopedia*, Vol. 2, p. 409), he then assumed command of the Trans-Baikal Military District. Having made his mark here, he then quietly made an unadvertised appearance in Rostov, and took command of the Northern Caucasus Military District. It was here that Konev completed the formation of the 19th Army and became its commanding officer. At the end of May 1941, in what General S. M. Shtemenko described as 'conditions of the strictest secrecy', he began to move the divisions and corps of his army up to the Romanian frontier. He held four posts in a short space of time. These stretched from the easternmost frontiers to the most western ones. Stalin always hid his best generals and marshals before every offensive operation (but

never before a defensive one). This particularly applied to Zhukov, Vasilevsky, Konev, Rokossovsky and Meretskov. In spring 1941, as always happened before all the most important offensives, Konev was covering up his tracks in such a way that even his closest friends would never know where he had gone.

Konev was not the only one who was covering up his tracks. Konev and other commanders temporarily held a number of posts as a blind; the same 'decoy' posting would often be passed from one officer to another. Colonel-General F. I. Kuznetsov gave up the command of the General Staff Academy to take over the Northern Caucasus Military District. He handed this over to Konev and then appeared on the East Prussian border, holding the post of officer commanding the North-West Front.

After General Konev had secretly disappeared from the Far East, the 2nd Army was left in the hands of General M. F. Terekhin, who was no substitute for a man of Konev's abilities. The situation was even more interesting in the 1st Army of the Far Eastern Front. After General Popov had left for the Northern Front, a worthy replacement, in the person of Lieutenant-General Andrei Ivanovich Eremenko (later Marshal of the Soviet Union) took his place. But Eremenko did not remain in charge for long. On 19 June 1941 he was ordered to hand over the 1st Army and report immediately to Moscow for another appointment. After the German invasion had begun, Eremenko became officer commanding the Western Front instead of General D. G. Pavlov. That was not the purpose of his visit to Moscow, however. On 19 June, such a turn of events had not been foreseen. Pavlov was firmly seated in his post of officer commanding the Western Front. Stalin must have called on Eremenko to fulfil some other mission which remains unknown, and possibly also unfulfilled.

I had the opportunity to meet Eremenko after he became a Marshal of the Soviet Union. I tried to sound him out on this subject without arousing his suspicions. My impression was that Eremenko was not dissimulating, but that he really did not know what Stalin needed him for on 19 June 1941. I pointed out to the Marshal that he had not been the only one in this position. I said that Sivkov, Kurdyumov, Zhadov, Petrov and Luchinsky had all been travelling on trains towards Moscow at the same time. The Marshal was very interested in all this. I regretted that I was not a Western historian with a passport of some democratic country in my pocket, for I was simply unable to take the conversation with the Marshal any further.

Eremenko was interested, and suggested another couple of generals who were moved from the Far East. Major-General N. E. Berzarin was deputy officer commanding the 1st Army. Eremenko told me something which he had left out of his memoirs. When he left the Far East, he handed over the command of the army to

his deputy Berzarin. Yet at the end of May, Berzarin was summoned by Stalin to Moscow and secretly appointed to command the 27th Army, then in the Baltic area not far from the German frontier.

Major-General Vassily Andreyevich Glazunov (later Lieutenant-General and officer commanding the Red Army airborne assault troops) was at the beginning of 1941 commanding the 59th Rifle Division in the 1st Army on the Far Eastern Front. Eremenko was very attached to the 1st Army, and did not want to see it left without a commander and at the mercy of Shelakhov, the 'headquarters rat'. But Stalin had already picked Eremenko's deputy, as well as the corps commanders, and the experienced divisional commanders had long since been transferred westwards. In the 59th Division there was only the experienced, martial clear-sighted General Glazunov. Eremenko told me that he immediately sent an enciphered message to the General Staff proposing that General Glazunov should be given the 1st Army. It was a big jump to go straight from a division to an army. But what else was there to be done when there were no more operational commanders left in the Far East?

Moscow immediately agreed that Glazunov was indeed a worthy commander, and in the enciphered reply ordered Glazunov to give up command of the division immediately, and instead take over command of the 3rd Airborne Assault Corps on the Romanian frontier.

At the beginning of June 1941, Stalin ordered that all Soviet airborne assault troops, including those which had recently been transferred from the Far East, should be concentrated on the western frontiers. Then at the last moment he assembled infantry and cavalry generals from distant frontiers and made them into commanders of airborne assault corps. This applied not only to Generals Glazunov and Zhadov, but to Generals M. A. Usenko, F. M. Kharitonov, and I. S. Bezuglyi as well.

The urgent transformation of infantry and cavalry generals into airborne assault officers is not a preparation for defence. It is not even a preparation for a counter-offensive. It is a sign of aggression in preparation; aggression which is inevitable, imminent, and on a vast scale.

CHAPTER 28

Why Stalin Deployed the Fronts

The war of the poor against the rich will be the most bloody war which has ever been waged between people.

F. ENGELS (*Works*, Vol. 2, p. 504,
Berlin 1959)

A 'front' is an operational-strategic grouping of armed forces. It includes several armies, air force formations, anti-aircraft defence, back-up units and formations, and rear units. Fronts do not exist in peacetime; military districts exist in their stead. A front is usually only created when war begins. (*Soviet Military Encyclopedia*, Vol. 8, p. 332)

The Far Eastern Front was set up within the Red Army in response to worsening relations with Japan in 1938. It consisted of the 1st and 2nd Armies, a tactical air force and reinforcement units. On 13 April 1941, a neutrality pact was signed with Japan. The Far Eastern Front, however, remained a front, and was not turned into a military district.

Fronts were established for short periods in 1939 and 1940 on the Soviet western frontiers in order to serve the 'liberation campaigns' into Poland, Romania and Finland. Once these campaigns had ended, the fronts were immediately disbanded and military districts were set up again to replace them. Historians have reproached Stalin for entering into pacts with both Germany and Japan, while maintaining a front only against Japan. This does indeed seem inconsistent at first glance; but Hitler was doing exactly the same thing. While he was deploying headquarters with impressive names against Britain, he was secretly moving his best generals up to the Soviet frontier. That is how a surprise strike is prepared.

Stalin had set up a front in the Far East, but the troops and the generals were secretly leaving it. Officially, the western frontiers still consisted of military districts, but here a build-up of troops was going on. Any comparison of the power of the Far East Front and that of any western military district would certainly not come down in favour of the front. While the Far East Front had three armies, all of them ordinary, the

Western Special Military District had four armies, including three shock and one heavy shock. Then three more armies belonging to the Second Strategic Echelon arrived on Western Special Military District territory. No one, on the other hand, was going to the Far Eastern Front; divisions and corps were being taken away from it. There was only one mechanized corps on the Far Eastern Front, while in the Western District there were six. There were no airborne assault troops on the Far Eastern Front, while in the Western District there was an entire corps. The Western Special Military District, moreover, was not the most powerful. The Kiev District was much more so.

The Far Eastern Front was not so much a front as a screen intended to show the whole world that war here was possible. But the five western military districts were also screens designed to show that no war was expected there. But the strike power concentrated in these districts after 1939 was rarely equalled by any Soviet front even during the heaviest battles of the war.

The front in the Far East was set up in such a way that everybody knew about it. In the western part of the Soviet Union, however, not one, but five fronts had been established in such a way that nobody knew about them. The Northern, North-West, Western, South-West and Southern Fronts were officially brought into being only after the German invasion. From February 1941, however, these names were already appearing in strictly secret Soviet documents. This security grading was later removed from a number of these documents, and they were put into academic circulation. I quote from one of them: 'In February 1941 the military councils in the frontier districts were sent instructions . . . that they should immediately equip the front command posts.' (*VIZH* 1978, No.4, p. 86)

Officially there were five military districts on the Soviet western borders. Unofficially, each military district was already preparing a front command post. Alongside the usual military-territorial structures, purely military ones were being created -the kind of structures which only spring up in time of war to lead the troops into battle.

Pro-Soviet historians assure us that peace existed between the Soviet Union and Germany until 22 June 1941, when this peace was allegedly violated by Germany. This hypothesis is not borne out by facts. The facts speak of the opposite. By deploying, command posts of the fronts in February 1941, the Soviet Union entered the war against Germany, although it did not officially declare it.

In peacetime the officer commanding a military district has a dual role. On the one hand, he is a purely military commander, with several divisions, sometimes several corps and even on occasions several armies under his command. On the other, he controls a strictly defined territory, and carries out the role of a military governor.

In the event of war, a military district on the frontier becomes a front. When this happens, three situations can arise. The first of these is where the front wages war in the territories of the former military districts. In this case the officer commanding the front continues to function both as a military commander and as a governor of the territories entrusted to him.

The second situation is where the front is forced to retreat under enemy pressure. In that event, the officer commanding the front will remain combat commander, and as he withdraws he will take along with him the organs of local government of his territory.

In the third scenario, the front moves forward on to enemy territory. It is only when this situation has been foreseen that the functions of the officer commanding are divided. He becomes a purely military commander and leads his troops forward. Some one of inferior rank must remain behind on the territory of the district to carry out the functions of military governor.

In February 1941, an event occurred which has so far been overlooked by modern historians. A new post for another deputy to the officer commanding was created in the Western Special Military District. What did this mean? Surely General D. G. Pavlov had enough deputies without yet another one! For several months this extra post of deputy remained vacant. Then Lieutenant-General Vladimir Nikolayevich Kurdumov arrived to take it up.

The significance of this event was considerable. In peacetime, General Pavlov, his deputy, Lieutenant-General I. V. Boldin, and Chief of Staff Major-General V. E. Klimovskikh were all to be found in Minsk. On mobilization, however, Pavlov was earmarked to become the officer commanding the Western Front,

Klimovskikh chief of staff of the Western Front, and Boldin the officer commanding the mobile group in the Western Front.

If the Western Front was meant to fight in Byelorussia, where it had been situated until the war began, there would have been no need to make any structural changes. But the Western Front was preparing to move on to enemy territory. It was for just such a circumstance that Lieutenant-General Kurdumov was brought in. Pavlov was to concentrate on purely military problems, while his new deputy would deal with territorial ones. When Pavlov led the Western Front into enemy territory, General Kurdumov would stay behind in Minsk to act as a purely territorial military governor, protecting the local authorities and lines of communication, controlling industry and transport, carrying out additional mobilization and preparing reserves for the front, which by then would have moved far ahead.

Kurdumov had commanded the Combat Training Directorate of the Red Army before being appointed to Minsk. From the viewpoint of the war of 'liberation', it was a splendid decision to have such an experienced general sitting in a place through which more and more young reservists would pass on their way westwards. He, better than anyone, would be able to give them their final instructions before going into battle.

Four armies, ten detached corps and ten air divisions then stationed on the territory of the Kiev Special Military District were also preparing to leave for enemy territory. They would be led by Colonel-General Mikhail Petrovich Kirponos, the officer commanding the South-West Front. With this in view, it became essential to split the two functions of the commanding officer. Here too an extra deputy's post was created, and Lieutenant-General V. F. Yakovlev was appointed to it. Kirponos would advance with his troops, while Yakovlev would remain in Kiev.

From the beginning of February onwards, the division of the two functions became increasingly evident. A secret command post was set up in Tarnopol. This was the centre of the military structure. The headquarters was kept on in Kiev to function as the centre of the territorial structure. A heavily reinforced underground command post for directing the territorial system was set up in Brovary, in the Kiev region. A command post of a very light type, consisting of dug-outs with one timber platform, was built in Tarnopol. This was entirely logical; why put up concrete casements when the military structure was not intended to remain in the Ukraine for long?

The structure was also divided in the Baltic Special Military District. The senior command staff moved to Panivejis, which from then onwards was to be the secret centre of the purely military structure of the North-West Front. A second-rate general, E. P. Safronov, was left behind in Riga to exercise military-territorial control after the main mass of Soviet troops had moved off westwards.

There was a slight difference in the Odessa Military District. Here it was not the headquarters of the front which was split off from the military district headquarters, but the headquarters for the 9th Army. Most officers belonging to the Odessa Military District headquarters, with its chief of staff Major-General M. V. Zakharov at their head, were secretly transferred to the headquarters of the 9th Army. Marshal of the Soviet Union I. S. Konev testifies that on 20 June the 9th Army headquarters were raised by a stand-to alert and secretly moved out of Odessa to the field command post. (*VIZH* 1968, No. 7, p. 42) Colonel-General Ya. T. Cherevichenko, officer commanding the Odessa Military District, had not been in Odessa for some time. He had secretly been in the Crimea, where he had taken command of the 9th Special Rifle Corps, which had arrived secretly from the Caucasus. Then, passing through Odessa by train, he went to the secret command post of the 9th Army, which had been entrusted to his command. Marshal of the Soviet Union M. V. Zakharov has stated that Cherevichenko was on a train when the German invasion began. (*Voprosy Istory*, 1970, No. 5, p. 46) Another general, N. E. Chibisov, appeared in Odessa *before* the German invasion began; his job was to remain behind to exercise military-territorial control after the 9th Army had left.

The Leningrad Military District was an exception. As in the other districts, a front - the Northern - was secretly set up, but in this case the structure was not divided. This was also logical. The Northern Front had until then made no preparations to advance far from Karelian territory, so two separate structures were not necessary. No extra deputy was appointed. Control of both military operations and of the territory would be exercised from the same centre, the headquarters of the Northern Front.

On 13 June, the day the TASS report was broadcast, these divisions in the control structures of all the western military districts - except Leningrad - were completed. On the same day, the People's Commissariat for Defence ordered all headquarters of the fronts to move to the field command posts.

From that point onwards there were two independent military systems of command in Byelorussia: the secretly created Western Front, commanded by General Pavlov with its command post in the forest near the Lesno railway station, and the Western Special Military District, under Lieutenant-General Kurdumov, with headquarters in Minsk. Two independent military control structures also came into being in the Ukraine, the South-West Front and the Kiev Special Military District. According to Marshal Bagramyan, Zhukov sent a special enciphered message that this development 'must be kept most strictly secret, and the headquarters personnel of the district must be warned to keep it so'. (*Tak Nachalas' Voina*, p. 83)

Lieutenant-General of Communications Troops P. M. Kur-ochkin, who at that time was a major-general and Chief of Communications of the North-West Front, describes the same situation in the Baltic:

Command elements and branches from headquarters began to arrive in the region of Panivejis. The district command was in fact turned into a front command although officially it went on being called a district command until the war began. A group of generals and officers, who had been given the job of running the district, was left behind in Riga. (*Na SZF*, p. 196, 1969)

The creation of two independent systems of control inevitably led to the creation of two independent systems of communications. Major-General Kurochkin personally ran the North-West Front communications, while Colonel N. P. Aki-mov, his former deputy, managed the independent communications system in the district.

General Kurochkin worked hard at setting up the front communication system. In order not to alert the enemy with a sudden upsurge in conversations on the new military channels, civilian communication lines were used. But the word 'civilian' must be placed between inverted commas. No such thing existed in the Soviet Union. The state communications system had been put on a complete war footing in 1939 and placed at the service of the army. The People's Commissariat (or Ministry) of Communications was placed directly under the orders of the People's Commissariat for Defence. In any normal country the military communications system is a component part of the general state communications system, but the reverse is the case in the Soviet Union. General state communications are a component part of military

communications; Ivan Terentievich Peresypkin, the People's Commissar for Communications of the USSR was officially a deputy to the chief of communications in the Red Army.

When the command of the North-West Front left for the field command post, the wartime communications system had been laid down beforehand:

All documents with the frequency plan, call-signs, and authentication signals were kept in the headquarters, for distribution to the troops in the event of war. There were several thousand radio stations in the district. Consequently at least a week was needed to put the work on a war footing. It proved impossible to do everything required in time. (Lieu-tenant-General P. M. Kurochkin, *Pozyvnye Fronta*, Moscow Voenizdat 1969, p. 115)

The entire procedure for changing over from a peacetime communications system to a wartime one was based on the assumption that a preliminary signal would come from Moscow at a time to be determined by Moscow. In other words, the plan was not drawn up to meet the conditions of a defensive war. It was drawn up to meet the conditions of a war which was offensive, aggressive and provided for a period of secret preparations.

The time for these final preparations to invade had now arrived. On 19 June Lieutenant-General P. S. Klenov, Chief of Staff of the North-West Front, issued an order to Kurochkin:

'Take action in accordance with the big plan. Do you understand what I'm talking about?'

'Yes, I understand everything,' I reported. (Kurochkin, *Na SZF*, p. 195)

It is a pity that we do not understand everything about the 'big plan'; no Soviet general has ever explained what it was. But we do understand that something connected with the 'big plan' should have happened in the

next few days. But, by taking the action he did, Hitler prevented the 'big plan' from being put into effect, and compelled the Soviet generals to improvise instead.

This is how General Kurochkin tried to ensure that the 'big plan' would be carried out:

The district communications branch sent documents dealing with the organization of radio communications ... to the headquarters of the armies and of formations under district command. All these documents, duly revised, had to pass along a channel leading through the corps, divisions, regiments, battalions and companies until they finally reached the operating team at every radio station. That would have taken, as I have said already, no less than a week. (*Ibid*, p. 118)

Top-secret information thus reached thousands of radio operators. It was an irreversible process. It was no longer possible to retrieve the secrets and hide them in the safes again. As soon as the material had left these safes, war had become quite unavoidable. Preparing an aggressive war is something like hatching a *coup d'etat*. A very small group of people make the plan. They do not trust the thousands who will take part in it with even a fragment of information. As soon as the leaders of the conspiracy reveal even the tiniest part of the plan to the thousands who will have a role in it, it then becomes totally unavoidable that the *coup* will happen. If they do not do this, the plotters lose their advantage of surprise, which is their greatest trump, and enable the enemy to respond with emergency measures.

But perhaps it was because Lieutenant-General Klenov anticipated German aggression that he ordered that elements of the 'big plan' should be revealed to these thousands who were to carry it out? Klenov, however, was quite categorical in his belief that a German invasion was not possible. He refused to believe it even after it had begun, and did nothing at all to repel the aggression after it had started. At the December 1940 meeting of the senior command staff, Klenov had suggested that only aggressive wars should be fought, and that these should be started by surprise attacks by the Red Army. He exceeded even the bold Zhukov in aggressiveness, and had the courage to argue with Zhukov in Stalin's presence about how a surprise attack should be made. Like Andrei Andreyevich Zhdanov, his protector in the Politburo, and indeed like many other Soviet military

and political leaders at the time including Stalin himself, he simply excluded the possibility that anyone else could make a surprise attack on the Soviet Union.

In the days which followed the publication of the TASS report on 13 June 1941, all the engines of war in the Soviet Union went into action. The deployment on the Soviet fronts had gone so far that thousands involved had already been let into secrets of extraordinary importance. The Soviet Union passed the point of no return in the middle of June 1941. After that, war was inevitable. If Hitler had decided to launch Operation Barbarossa a few weeks later, the Red Army would have reached Berlin much earlier than 1945.

When a large-scale offensive takes place, several fronts are engaged in operational action at the same time. This action has to be co-ordinated, and this co-ordination is done by the Representatives of the High Command.

These Representatives can help make the strategic leadership considerably more flexible in wartime. They have almost unlimited power in the field of combat. On the one hand, the Representative is a member of the supreme military leadership, and as such knows plans which the officer commanding a front does not have the right to know. On the other, he directs combat operations not from some office in Moscow but directly from the command post of a front or an army, where he presents himself just before the operation begins. The Representative is free from the daily routine work of the officer commanding the front and can devote all his attention to the most important issues. At a critical moment, he might find himself alongside the Supreme Commander in Chief, giving him essential advice; or else he might find himself sent by the Supreme Commander to the most critical sector where the fate of the war is being decided.

These Representatives were the best military minds in the country. Their appearance always meant that great events were about to happen.

The day the TASS report was published, many inexplicable events took place. My own information is fragmentary, inadequate, and at times contradictory. On the basis of the little information which can be

checked, however, the secret visit of the Representatives of the Soviet High Command to the western frontiers was clearly the main business of the day.

Among these Representatives was Lieutenant-General Pavel Rychagov, deputy People's Commissar for Defence. He was a favourite of Stalin and a personal friend of Zhukov. Although still only 29, he had already distinguished himself in air warfare in Spain, China, Khasan and at Khalkhin-Gol. He had commanded the 1st Army's air force in the Far East, and then the 9th Army's air force in the 'liberation' of Finland. On Stalin's personal orders, Rychagov always appeared where the Red Army was about to launch a surprise attack. His promotion was rapid. In 1940 Stalin appointed him a deputy chief of the Red Army Air Force; then in the same year first deputy chief; and in August of the same year the head of the Chief Directorate of the air force of the Workers' and Peasants' Red Army.

In December 1940, a meeting was held of the Red Army's senior command staff to discuss the subject of war against Germany. It was attended by Stalin and the principal political leaders. Zhukov's proposal was to put the German Air Force out of action by delivering surprise attacks on German airfields, and then immediately launching powerful attacks by the land troops. (*Istoriya Sovetskoi Voennoi Mysli*, Izdanie Akademii Nauk SSR, Moscow 1980, p. 173) Pavel Rychagov warmly supported Zhukov's proposal. Even before Zhukov, he had recast the training of Soviet airmen in such a way that it almost totally excluded the training of pilots to fight air battles. Instead, they were trained to make sudden concentrated air strikes at enemy airfields. In his memoirs, Zhukov recalled the impassioned speech which Rychagov made at the meeting: 'General P. V. Rychagov, the chief of the air force of the Workers' and Peasants' Red Army, talked a lot of sense.' (*Vospominaniya I Razmyshleniya*, 1969, p. 194) It is only a pity that Rychagov's sensible speech still remains a Soviet state secret half a century after it was made.

Zhukov and Rychagov's arguments apparently convinced Stalin. In the course of the meeting and in the series of strategic map games which followed it, Stalin dismissed the Chief of the General Staff and appointed Zhukov to the post. A few days later Pavel Rychagov was also promoted. In spite of his comparatively modest rank, Lieutenant-General Rychagov was given an extremely high appointment, that of deputy to the People's Commissar for Defence. Stalin appointed Lieutenant-General P. F. Zhigarev to take over command of the air force from Rychagov. Freed from daily routine, Rychagov became a High Command Representative; it was a very high post with access to state secrets, and with no responsibility for day-to-day minor matters. Rychagov

became in his way a sort of minister without portfolio among the senior Soviet military leaders. He continued to work hard on his ideas of surprise, speed, and concentration, and on how to clear the skies for Soviet aircraft with several hours of concentrated bombing raids on enemy airfields. Zhukov and Rychagov, in fact, were preparing to do what Hitler did on 22 June 1941. As General Ivanov put it, 'The Nazi command simply succeeded in forestalling our troops in the two weeks preceding the outbreak of war.' (General of the Army S. P. Ivanov, *Nachal'nyi Period Voyny*, Moscow 1974, p. 212)

In the spring of 1941, Rychagov was permanently on standby, awaiting Stalin's orders to go anywhere that fateful decisions on the war had to be made. Now the hour had arrived. On 13 June 1941, under cover of the TASS report, Rychagov went secretly to the German frontier. Falsifiers of history explain Rychagov's appearance there in quite simple terms. Stalin was worried that the Germans might possibly attack, and so he sent Rychagov to the border to improve the defences there.

If Stalin had been anxious about defence, he should have pulled back the Soviet Air Force from the frontiers and re-based it in the depths of the country. The air force would have been quite capable of covering the frontier areas from the interior of the country, while the few hundred kilometres which lay between the airfields and the frontiers would have deprived the enemy of an ability to make a surprise attack on Soviet airfields. But General Rychagov's visit to the frontier did not coincide with the re-basing of Soviet aircraft in the depths of the country. On the contrary, it coincided with aircraft from the depths of the country being re-based right on the frontiers. In terms of defence, concentrating an air force on the frontiers is tantamount to suicide. But when an offensive is being prepared, it is absolutely essential to concentrate aircraft near the frontiers, so that they can be used over enemy territory to the full extent of their operating radius.

The German generals, incidentally, were doing the same thing, although they were some two weeks ahead, and were sparing no effort to re-base their air force close to the Soviet border. Had Stalin been the first to strike, we would now regard the German generals as madmen. But re-basing an air force near a frontier is madness only from a defensive viewpoint. In terms of an offensive, the German generals were doing everything right, as were their Soviet colleagues.

We can only guess why Rychagov went to the Soviet western border. After Operation Barbarossa began, Rychagov was arrested and executed on Stalin's orders. Why he was executed also remains a mystery. It could not have been for losing a vast number of Soviet aircraft on airfields near the frontier; Pavel Rychagov

had ceased to be responsible for the safety of Soviet aircraft in February 1941. Responsibility for that now lay with Lieutenant-General P. F. Zhigarev. Stalin did not shoot Zhigarev for having lost the aircraft. He did not even reproach him for it. On the contrary, the lieutenant-general rose to the rank of Air Chief Marshal and survived Stalin by ten years. If Stalin did not shoot Zhigarev, who bore the personal, direct and immediate responsibility for the basing of the air force and its security, why then shoot Rychagov, who did not have this responsibility?

It is my opinion that Rychagov went to the Soviet frontier on some crucial mission entirely unconnected with the security of the Soviet Air Force. For failing to complete that crucial mission, of which we know nothing, Stalin shot the youngest deputy to the People's Commissar for Defence that the Red Army ever had.

Colonel-General A. D. Loktionov, candidate member of the Central Committee, held the post of deputy to the People's Commissariat of Defence as early as 1937. Loktionov commanded the Soviet Air Force until 1940, when in the summer of that year Stalin for some reason gave Loktionov the opportunity to make a very detailed study of the frontier with East Prussia. He sent Loktionov off to command the Baltic Military District, which embraced the territories of the recently 'liberated' Baltic states. In February and March 1941 Stalin began secretly to assemble the Supreme Command Staff in Moscow. Loktionov handed over command of the Baltic Military District (the North -West Front) to Colonel-General F. I. Kuznetsov, and set off for Moscow 'for medical treatment'. By 13 June, all Loktionov's illnesses were cured and he secretly returned to the frontier with East Prussia.

We know that Lieutenant-General of Engineering Troops D. Karbyshev had visited the Soviet western border even before this. One of Karbyshev's pupils, Lieutenant-General of Engineering Troops E. Leoshenya, has stated that 'Karbyshev was on a mission for the General Staff in the area of the western state frontier.' (*VIZH* 1980, No. 10, p.96) Karbyshev was not just another of those professors from the military academies who were gathering on the frontier, but one of the Soviet High Command Representatives. He was actively and energetically preparing an offensive operation. It was in Karbyshev's presence that Soviet frontier guards were pulling down the frontier barriers, in order to clear the way for an extra-high-power and very swift Soviet operation. It was Karbyshev who was teaching the crews of the latest T-34 Soviet tanks how to overcome enemy defences and to ford frontier rivers. In addition, along with commanders from the fronts and the armies, Karbyshev was making reconnaissance trips.

Before taking even one step forward, a commander will inspect the terrain which lies before him. Much information will, of course, have been gathered in advance by reconnaissance. Although the commander will certainly trust his reconnaissance, he will always want to inspect the whole terrain personally. This is no empty ritual. Before moving his troops forward, a commander must get the feel of the land. There's a hollow here—would the tanks get bogged down in the mud? There's a small bridge there. Haven't the supports been sawn through? And a counter-attack could come from that wood there . . .

If the commander cannot pass over the whole of the terrain in his imagination, if he is unable to assess all the difficulties which his soldiers will have to face, the price he will pay will be defeat. That is why, before an offensive battle, every commander, irrespective of rank, will put on a soldier's uniform and crawl on his stomach in the mud alongside the state frontier or forward area; and why, if he is in a forward area, he will spend many hours inspecting the terrain in front of him, as he tries to foresee and envisage before the battle all the difficulties which might be awaiting him tomorrow.

This visual study of the enemy and the terrain by the commander is called reconnaissance. It is not the most agreeable surprise when enemy reconnaissance groups turn up on your frontier. It is not too bad if it is only a tank division commander spending long hours watching you through binoculars from the other side of the border. But imagine the officer commanding a Soviet military district appearing on your frontier, not alone, but accompanied by a member of the Politburo, and spending not hours, but weeks at the frontier posts! What would you think then?

It was like that before every 'liberation'. In January 1939, K. A. Meretskov, the officer commanding the Leningrad Military District, accompanied by A. A. Zhdanov, shortly to become a Politburo member, drove up and down the whole of the Finnish frontier in a motor car. Their trips went on throughout spring, summer and autumn. They finished their expeditions as autumn was drawing to a close and returned to Leningrad. The next thing was that the 'Finnish militarist clique provoked war'.

From early 1941, German officers and generals began, gradually at first and then with increasing intensity, to reconnoitre the German side of the frontier. There is a famous photograph on my table showing General

Guderian with officers from his headquarters carrying out the final reconnaissance near Brest-Litovsk on the night of 22 June 1941. The German generals are looking at Soviet territory through binoculars. As Operation Barbarossa approached, Soviet generals and marshals noticed an increasing number of German reconnaissance groups on the border. (*Glavnyi Marshal Aviatsy A. A. No-vikov v Nebe Leningrada*, Moscow Nauka 1970, p. 41) The German reconnaissance groups camouflaged what they were doing by every possible means. They donned the uniforms of frontier guards and ordinary soldiers, but an experienced eye could of course distinguish between a reconnaissance group and a frontier patrol. Reports began to flow from the Soviet border that German officers were carrying out intensive reconnaissance. This was a clear sign that war was approaching. Marshal of the Soviet Union M. V. Zakharov, then a major-general and 9th Army chief of staff, has said that from April 1941 onwards, a 'new situation arose'. It took the form of groups of officers dressed in German and Romanian Army uniforms appearing on the river Prut. All the signs were that they were carrying out reconnaissance. (*Voprosy Istory* 1970, No. 5, p. 43)

Reconnaissance is preparation for an offensive. What were the Soviet commanders doing? Why did they not take immediate measures to repel the coming aggression, the inevitability of which was being confirmed by the presence of the enemy reconnaissance groups? The Soviet generals did not react to what they saw for one simple reason: the Soviet generals were busy carrying out their own reconnaissance.

Major-General Petr Vassilyevich Sevast'yanov was then head of the political branch of the 5th Czechoslovak Proletariat Vitebsk Red Banner Rifle Division of the 16th Rifle Corps of the 4th Army of the North-West Front. He recalled how, 'observing the German frontier guards from a distance of something like 20—30 paces, and exchanging glances with them, we never gave the appearance of realizing that they were there, or that we were in the slightest degree interested in them'. (*Neman-Volga-Dunai*, Moscow Voenizdat 1961, p. 7)

General Sevast'yanov's account shows that he observed the German frontier guards on more than one occasion. In fact it happened regularly. So here is a question: Comrade General, what precisely were you doing so close to the frontier? If you were disturbed at the thought that the Germans might invade, then you should have ordered five or six fences of barbed wire to be stretched out along the frontier, so that nobody could slip through. You should have laid the mined traps more densely. Then you should have laid a real minefield about three kilometres deep behind the barbed-wire entanglements, then dug anti-tank ditches behind the minefields and covered them with static flame-throwers, and behind these, another 20-30

stretches of barbed-wire entanglements, this time on metal stakes, or better still, steel rails set in concrete. Further back still, another minefield - a false one, with the real minefield behind it. Then dig another anti-tank ditch. Then behind all this, construct forest traps, and so on indefinitely.

If the general had really been preparing for defence, there would have been no need for him to stare at the German frontier guards. He would have had to study not foreign territory but his own, and the more deeply he did it, the better. Near the frontier he could have kept small mobile detachments which, in the event of an attack, could easily have withdrawn through secret gaps in the engineered defences zone, mining the path as it went.

This was Finland's exemplary approach when it was preparing to defend itself. The Finnish generals had certainly no need to stand on the border and scrutinize foreign territory. The Soviet Army, however, did not put up any engineered defences on its frontiers, and Soviet generals, like their German colleagues, ended up spending weeks and months just a few paces from the state frontier.

Colonel D. I. Kochetkov recalls that the commander of the Soviet tank division in Brest-Litovsk, Major-General Puganov, selected both the site for his divisional headquarters, and the position of his office in it, so that he could 'sit in the divisional commander's office with Colonel Commissar A. A. Illarionov and look out of the window through binoculars at the German soldiers on the opposite bank of the Western Bug.' (*Zakrytyimi Lyukami*, Moscow Voenizdat 1962, p. 8)

Idiocy, we cry in indignation. Once the war had begun, it would be a simple matter to fire an automatic weapon from the opposite bank at the divisional commander's window, or better still, fire a cannon at it. The divisional headquarters was a sitting target. But let us not be too indignant. Seen from the viewpoint of attack, everything falls into place. Guderian was doing exactly the same thing on the opposite bank. His German tank group on the other side had also been moved right up to the river, and *he* was looking out of *his* window through binoculars at the Soviet side. Sometimes Guderian, hiding his identity, would appear with his binoculars at the river's edge. Just before Operation Barbarossa began, he even stopped trying to disguise himself. There he stood in his general's uniform, along with his officers, looking through binoculars, just like his Soviet enemies. Let us not call the Soviet generals idiots, for we do not see anything idiotic in what the German generals were doing. It was simply the normal preparation for an offensive. It is always done like that, in all armies including both the Soviet and the German. The only difference was that the Soviet Union was

preparing its operation on an incomparably greater scale than the German Operation Barbarossa. That is why the Soviet commanders began their reconnaissance activities considerably earlier than the German commanders, although they did not intend to complete them until July 1941.

In July 1940, on the orders of General K. A. Meretskov, the entire western frontier was reconnoitred. Thousands of Soviet commanders of all ranks took part in it, including generals and marshals holding the most senior posts. Meretskov himself, who had recently surveyed the Finnish frontier, now did the same thing on the Romanian and German frontiers. Then, accompanied by Colonel-General M. P. Kirponos, the officer commanding the South-West Front, Meretskov repeated the reconnaissance along the whole sector of the Kiev Special Military District. 'From Kiev', he recalled, 'I went to Odessa, where I met Major-General M. V. Zakharov, the District Chief of Staff. I went with him to the Romanian cordon. We looked across to the other bank, and saw some military figures looking at us.' (*Na Sluzhbe Narodu*) This same General Zakharov had said in April 1941 that the reconnaissance being done by groups of German generals had brought about a 'new situation'. It is interesting to speculate whether it occurred to him or his fellow officers that the German reconnaissance activities which began in April 1941 were simply a response to the concentrated Soviet reconnaissance which had been going on since July 1940?

Meretskov then hastened from the Odessa Military District to Byelorussia, where he joined General D. G. Pavlov in carefully reconnoitring the Soviet-German frontier and the territory behind it. After a brief visit to Moscow, Meretskov went again to the Northern Front. He said in passing that he had not found the officer commanding the North-West Front in his headquarters, because he was now spending a great deal of time on the frontier. Lieutenant-General M. M. Popov, the officer commanding the Northern Front, was not at his headquarters either. He too was on the frontier.

In 1945 Stalin and his generals launched a brilliant surprise strike at Japanese troops, and seized Manchuria, northern Korea and several Chinese provinces. The preparations to deliver this surprise attack were made in exactly the same way as the preparations had been made to attack Germany in 1941. The same Meretskov turned up on the frontier. He was by then a Marshal of the Soviet Union. He appeared secretly on the Manchurian frontier under the pseudonym of 'Colonel-General Maksimov'. Reconnaissance was one of the main elements in his preparations. 'He went all over every sector in a cross-country vehicle and even on

horseback in places.' (*Red Star*, 7 June 1987) All Soviet generals and marshals did the same before every offensive. Their opposite numbers in the Wehrmacht, Guderian, Manstein, Rommel and Kleist, did the same.

Commanders of Soviet divisions and corps stationed in the depths of Soviet territory were frequent visitors to the frontier. Marshal Rokossovsky (then a major-general commanding a mechanized corps some way back from the frontier) recalls that he often visited I. I. Fedyuninsky, whose corps was directly on the frontier. General Fedyuninsky recalls in his memoirs that his colleagues, including Rokossovsky, did indeed pay frequent visits. The memoirs of Soviet marshals and generals contain hundreds, even thousands, of such instances.

Marshal of the Soviet Union K. S. Moskalenko (then a major-general of artillery and commander of the 1st Anti-Tank Brigade of the High Command Reserve, the RGK) makes a direct connection between the TASS report and the sharply increased involvement of Soviet commanders in reconnaissance. When Major-General of Tank Troops M. I. Potanov, the officer commanding the 5th Army, discussed the TASS report with General Moskalenko, he told him to pick 'some good people who are literate in the military sense and go off to the frontier. Let them do some reconnaissance in the area and observe the Germans and what they are doing. You too will find it useful.' (*Na Yugo-Zapadnom Napravleny*, Moscow Nauka 1961, p.21)

In a defensive operation there is nothing for an anti-tank brigade to do in a forward area. The commanding officer of an army will throw an anti-tank brigade into battle only in a really critical situation, when the enemy has already broken through the defences of the battalions, the regiments, the brigades, the divisions and the corps, when a crisis of army proportions has arisen, and when the direction of the enemy's main thrust is quite clear. This, however, could only happen far in the depths of the Soviet defences.

General Moskalenko's brigade, however, was neither an army nor a front brigade. It was a brigade of the RGK, the High Command Reserve. In defensive action, it would be held in reserve for an even more serious situation, where the army and even the whole front had been broken, and a crisis on a strategic scale had arisen. In order to solve the strategic crisis, the brigade would have to be situated not on the frontier, but dozens or even hundreds of kilometres from it, in the place where the actual strategic crisis had arisen. When defensive operations are in preparation, the commander of an RGK anti-tank brigade has absolutely no reason to be anywhere near a frontier.

But if a grand-scale Soviet offensive were being set up to move from the L'vov salient into the heart of enemy territory, then the left flank of the most powerful grouping of troops ever seen would be covered by the Carpathians (and the mountain armies who were turning up there), while the right flank would have to be covered by an extra-high-power anti-tank formation right on the frontier. That was where the brigade was, and where General Moskalenko in person set off on General Potanov's orders to reconnoitre enemy territory.

If someone should attempt to explain this Soviet grand-scale reconnaissance by saying that the Soviet Union was preparing for defence, I would remind him that there were very many sappers, including some of the best, in the Soviet reconnaissance groups. If defences are being set up, there is no point in having a sapper look at enemy terrain. He has enough work to do on his own ground. The deeper he moves into his own territory, the more work the sapper will have to do. But Soviet sappers for some reason were spending long hours examining enemy territory.

If these grandiose reconnaissance operations had a defensive purpose, then they should not have been performed on the frontier. Positions suitable for defending should have been selected and reconnoitred some hundred kilometres inside the country. Then they should have been thoroughly prepared for defensive battles. That done, the entire senior command staff should have fallen back to the old frontier lines to reconnoitre these old abandoned positions, and then deeper still into Soviet territory, to the Dnieper line for example, to prepare still more defences.

Reconnaissance from frontier posts is reconnaissance for aggression.

The Politburo held a secret session on 21 June 1941. According to the Soviet historian V. Anfilov, 'Communist Party leaders and members of the Soviet government were in the Kremlin throughout the day of 21 June, and resolved some state and military problems of the utmost importance.' (*Bessmertnyi Podvig*, Moscow Nauka 1971, p. 185)

Only four of the problems under discussion at this meeting are public knowledge. It is not known how many other problems were discussed that day. The first of the decisions which we know about was to arm the Red

Army with a BM-13 salvo-fire mobile installation; to begin production in series of BM-13 installations and M-13 rocket missiles; and also to begin forming rocket artillery units. The BM-13 was given its unofficial name of Katyusha in the weeks which followed.

The second Politburo decision was to set up front formations based on the western frontier military districts. (Lieutenant-General P. A. Zhilin, corresponding member of the Academy of Sciences of the USSR, *Velikaya Otechestfennaya Voina*, Moscow I PL 1973, p. 64) The fronts of course existed before then; the Politburo was merely formalizing decisions which had already been taken. Nevertheless, the decision of 21 June is supremely important because it provides official confirmation of the fact that five fronts were set up and formalized in secret *before* the German invasion, not after it.

The Politburo session lasted all day and continued far into the night. A few hours later, Zhukov rang Stalin and tried to convince him that something unusual was going on on the frontier. Many eyewitnesses and historians have described that moment. There is no doubt that not only Stalin but Molotov, Zhdanov and Beria all refused to believe that a German invasion was possible. Their unwillingness to believe this is confirmed by everything the Red Army did: anti-aircraft guns did not fire on German aircraft; Soviet fighters were forbidden to shoot down German planes; troops in the First Echelon had their ammunition taken from them; and draconian orders not to give in to provocation flowed from the General Staff. It is clear from this that the fronts were set up not to repel a German invasion – which the Soviet High Command did not believe was possible -but for some other purpose.

The third decision taken by the Politburo that day was to set up a group of armies of the High Command Reserve (RGK). Marshal of the Soviet Union S. M. Budennyi, first deputy to the People's Commissariat for Defence, was appointed its commanding officer. Major-General A. P. Pokrovsky (later a colonel-general) became the group's chief of staff. Seven armies of the Second Strategic Echelon, which had been moved secretly into the western areas of the country, joined the new army group.

In his memoirs, Colonel-General Pokrovsky called the new formation 'the group of troops of the Stavka Reserve'. (VIZH 1978, No. 4, p. 64) This name indicates the nature of the fourth decision made at this meeting: to set up a Supreme Command Stavka, the supreme body which controls the armed forces in war.

It is quite possible that the decisions to set up the group of armies and the Supreme Command Stavka had been taken previously and were merely ratified at the Politburo meeting of June 21. Evidence of this is provided by repeated indications that the German invasion found Major-General A. P. Pokrovsky already at his battle post in the western part of the country. (F/ZHi978, No. n, p. 126)

The fact is that before the German invasion occurred, the Second Strategic Echelon was not just seven different armies but a fighting machine with one single leadership. Why was this done? In a defensive war, a single leadership for the armies of the Second Strategic Echelon would have been entirely unnecessary. (It was in fact dissolved even before the Second Strategic Echelon came up against the enemy.) In peacetime the Second Strategic Echelon was not needed at all. Nor was there anywhere for it to train or quarter in the European part of the country.

The Politburo meeting gave the overall leadership of the South-West and Southern Fronts to Zhukov, and of the Northern Front to Meretskov. (General S. P. Ivanov and Major-General N. Shekhovtsev, *VIZH* 1981, No. 9, p. 11) Meretskov had commanded an army in the 'liberation' of Finland not long before. He was now sent back there as High Command Representative. Zhukov had recently been in command of the Southern Front when the eastern areas of Romania were 'liberated'. He was now sent back there as High Command Representative to co-ordinate the operations of the two fronts.

Meretskov left immediately. Zhukov delayed leaving Moscow for a few hours, and Operation Barbarossa caught him in the General Staff building. But that was chance. Had Barbarossa begun a few hours later, then Zhukov himself would have become part of that raging torrent flowing towards the western borders of the country, carrying along with it generals from the General Staff, *kombrigs* from the GULAG, labour-camp prisoners and their guards, commanders from the reserve, and military academy students and their teachers from far and wide.

Soviet historians say of the German commanders that 'right up to the time of the invasion of the USSR in June, von Brauchitsch and Halter made one journey after another to visit the troops'. (Anfilov, *Bessmertny Podvig*, 1923, p. 65) Were Zhukov and Meretskov behaving any differently?

The operations of the two armies were strikingly similar. As the one did not know what the other was going to do, the Wehrmacht and the Red Army copied each other down to the last detail. The Soviet commanders

moved their command posts nearer the frontier, like their German colleagues; the Red Army concentrated two extra-high-power groupings on the flanks in frontier salients just as the German Army had done. Soviet aircraft were concentrated right on the frontier, just like the German aircraft. Soviet pilots were forbidden to shoot down German aircraft until a specific moment, just as German pilots were forbidden to shoot down Soviet planes, so as not to set off the conflict before its time, and so that the attack when it came should be a complete surprise. Hitler's command post was near Rastenburg in East Prussia, while the Soviet Chief Forward Command Post (GPKP) was near Vilnius. They are exactly the same distance from the frontier; if the Soviet and German chief command posts were marked on a map, and the map was then folded along the frontier, the two marks would come together.

After the Politburo meeting on 21 June had ended, many of its members dispersed immediately to their war posts. Zhdanov, who had controlled Finland's 'liberation', got ready to go to Leningrad on 23 June. Khrushchev, who had controlled the 'liberation' of the eastern provinces of Poland and Romania, set off for Kiev, and possibly for Tiraspol' as well. Andreev, who was responsible in the Politburo for war transportation (General A. A. Epishev, *Partiya i Artniya*, Moscow IPL 1980, p. 176) sped along the Trans-Siberian Railway in order to accelerate the movement of the Second Strategic Echelon armies. He was seen next day in Novosibirsk. (Lieutenant-General S. A. Kalinin, *Razmyshleniya o Minuvshem*, Moscow Voenizdat 1963, p. 131)

The Politburo's secret decision to deploy the five fronts on the Soviet western frontiers inescapably committed the Soviet Union to beginning active operations. Each of the Soviet fronts were consuming, among other things, up to 60,000 head of cattle per month. (Marshal S. K. Kurkotkin, *Tyl SVSvVO V*, Moscow Voenizdat 1977, p. 325) By the following year, more than three million head of cattle would be needed to feed these five fronts. In addition to these, the seven armies of the Second Strategic Echelon and three NKVD armies which had been deployed behind them all had to be fed, as well as four fleets, the Soviet troops who were preparing to 'liberate' Iran, the air force, the troops of the anti-aircraft defences and, above all, the war industry.

The Soviet General Staff were clearly concerned:

In spite of the great successes in the sphere of agricultural development on the eve of war, the grain problem has not been solved because of a number of reasons. State deliveries and purchases of grain did not meet all the country's needs for bread. (*VIZH* 1961, No. 7, p. 102)

A. G. Zverev, the Stalinist People's Commissar for Finances and member of the Central Committee, claimed that 'by the beginning of 1941 the number of head of cattle we had was below the level in 1916'. (*Zapiski Ministra*, Moscow IPL 1973, p. 188) It must be borne in mind that the level of 1916 was not the normal level for Russia, but the level to which the country's agriculture had sunk after two ruinous years of war. There were less head of cattle in the Soviet Union in 'peacetime' than there had been in Russia at the height of World War I. At these catastrophic levels, disorders can break out, the normal social structure can break down and crowds can take to the streets.

Having themselves been carried to power on a wave of disorders, the communists did not improve the country's food situation. They worsened it to the point where the country was still trying after a quarter of a century to reach the very low level to which the economy had sunk as a result of the Great War. Stalin created a colossal army and a colossal war industry, but for this he sacrificed the nation's patrimony which had been accumulated over the centuries, and also the nation's standard of living which he lowered to below the level at which people were living during the Great War.

From the beginning of 1939, Stalin began to transfer the resources of a catastrophically weakened agriculture to the army and war industry. The army and industry swiftly put on weight, while agriculture became horrifying thin. The process gathered speed. The 1,320 military trains laden with motor vehicles on the Soviet western frontier came not from the war industry but from the collective farms. In May 1941, 800,000 reservists were secretly mobilized into the Red Army. They came not only from the labour camps, as we have seen, but also from the collective farms. There were reserved occupations in industry, but not in agriculture. Thus the mobilization added to the number of mouths to feed, while reducing the number of agricultural labourers to feed them.

The existence of five voracious fronts, and the secret mobilization of peasants and technicians before the harvest had been gathered, would have led inevitably to a famine in 1942, even without any intervention by

the Germans. Once the all-consuming fronts had been deployed, there was no option but to send them into action the same year. If they stayed where they were, they would quite simply have nothing left to eat. A surprise attack by the Red Army in 1941, on the other hand, held the promise of new rich territories with abundant reserves of food. Even if these supplies proved inadequate, it would not matter too much; a famine in the middle of a war is understandable and can always be explained away.

The only Soviet marshal whom Stalin trusted completely was B. M. Shaposhnikov. As early as 1929, Shaposhnikov had expressed the categorical opinion that it was impossible to mobilize hundreds of thousands and millions of people and keep them in prolonged inactivity in the frontier area. (*Mozg Army*, Vol. 3, GIZ, 1929) It is much easier to control an army in the course of a war than millions of armed and hungry men boiling over with frustration and resentment against their leaders.

When he set up the fronts, Stalin destroyed the already unstable balance between his huge armies and the country's exhausted, ruined agriculture. It was all or nothing, and Stalin could no longer wait until 1942 to launch an offensive.

CHAPTER 29

Why Stalin Did Not Trust Churchill

Between June 1940 and the German invasion of the Soviet Union a year later, an interesting correspondence took place between Winston Churchill and Josef Stalin. The letters which the embattled British leader addressed to the Soviet head of state have assumed an almost legendary quality, and are known to history as 'Churchill's Warning'. It is widely believed that in these letters Churchill warned Stalin of the impending German attack on the Soviet Union. Much energy has been expended in speculating why Stalin failed to heed this friendly and obviously well-informed advice.

Perhaps we should be asking, why *should* Stalin have trusted Churchill? After all, Churchill had been an implacable opponent of communism since 1918, when he had proposed an alliance with Germany against the newly-formed Soviet state. Lenin himself had described Churchill as 'the worst hater of Soviet Russia'. (PSS, Moscow, Vol. 14, p. 350) Under the circumstances, it is hardly surprising if Stalin treated any message from Churchill with a considerable degree of scepticism.

One must also bear in mind the political background to World War II. Germany was most disadvantageously placed in the diplomatic war of the 1930s. Situated in the heart of Europe, it was at the centre of all conflicts. Whatever war might begin in Europe, Germany would almost inevitably be involved in it. Therefore the diplomatic strategy of many countries in the 1930s boiled down to this attitude - you go to war with Germany, and I shall try to stay out of it. The Munich agreement of 1938 was a striking model of this philosophy.

Stalin and Molotov won the diplomatic war of the 1930s. With the Molotov—Ribbentrop Pact, Stalin gave the green light for World War II, of which he remained a 'neutral' observer, while training a million parachutists as a contingency against 'any surprises'.

Britain and France lost the diplomatic war and were then compelled to fight a real war, from which France made a rapid exit. Where did Britain's political interest lie? Looking at the situation through the eyes of the

Kremlin, Churchill could have only one political aspiration – to find a lightning-conductor for the German *Blitzkrieg* and deflect the German attack to anywhere else other than Britain. In the second half of 1940, only the Soviet Union could be such a lightning-conductor.

Put more simply, Britain (in Stalin's opinion, which he openly expressed on 10 March 1939) wanted a clash between the Soviet Union and Germany, while it stood aside from the fight. I do not know whether that was Churchill's intention or not, but that is exactly how Stalin would have seen every move made by the British government and its diplomats. As Admiral of the Fleet N. G. Kuznetsov put it, 'Stalin of course had more than enough grounds for thinking that England and America were seeking to have us collide head-on with Germany.' (*Nakanune*, 1966, p. 321)

The strategic situation in Europe also influenced Stalin's response. The concentration of power against weakness is the main principle of strategy. Germany was unable to apply this principle in World War I because it was fighting on two fronts. Attempts to concentrate great efforts on one front automatically led to the weakening of the other front and the enemy immediately exploited it. As a result, Germany had to renounce a strategy of destruction in favour of the only other alternative, a strategy of attrition. But Germany's resources were limited, while the resources of its enemies were unlimited. A war of attrition for Germany therefore could only end in catastrophe.

Both the German General Staff and Hitler himself understood that a war on two fronts would be catastrophic for Germany. In 1939-40, Germany always had in effect only one front. The German General Staff therefore was able to apply the concentration principle, and it did so brilliantly, concentrating the enormous German military power first against one enemy, then against the other.

The main problem facing German strategy was to prevent war breaking out on a second front. As long as the Germans were fighting on one front only, they won brilliant victories. Speaking at a meeting with High Command staff of the German armed forces on 23 November 1939, Hitler said that a war against the Soviet Union could begin only after the war in the West had ended.

Now supposing that someone had told you in 1940 that Hitler intended to renounce that great principle of strategy, and instead of concentration was preparing to disperse his forces. Someone keeps on whispering in your ear that Hitler quite intentionally wants to repeat the biggest mistake Germany made in World War I.

Every schoolboy knows that war on two fronts is suicide for Germany. World War II was to prove this rule once again, and also that, for Hitler personally, war on two fronts would be suicide in the purest sense of the word.

If Soviet Military Intelligence had reported anything like this, I should have advised General Golikov, the head of the GRU, to give up his post, go back to his academy and make another study of the reasons for the German defeat in World War I. If some neutral person from outside had told me about this suicidal war, I should have replied that Hitler was not an idiot, but that you, dear friend, certainly are one if you think that Hitler will begin a war on two fronts of his own free will.

Churchill was more interested than anyone else in the world in Hitler having not one, but two fronts. In such a situation, Churchill had too great a vested interest for Stalin to believe what he said.

Apart from the purely strategic and political situations, account must also be taken of the environment in which Churchill wrote his messages and Stalin read them.

France fell on 21 June 1940. The piracy of German U-boats increased sharply on the sea-routes. There hung over Britain, an island nation with close trade links with the rest of the world, the threat of a naval blockade and the most acute crisis in trade, industry and finance. Worse still, the German military machine, which at that point seemed invincible to many, was making intensive preparations to land on the British Isles.

It was in this environment that Churchill wrote to Stalin on 25 June. On 30 June, the German armed forces captured Guernsey in the Channel Islands. In a thousand years of British history, there have been few occasions when an enemy has landed on the British Isles. What was to follow? A landing on mainland Britain? Guernsey was taken without resistance. For how long would Britain resist?

Stalin received Churchill's message the day after Germany had seized Guernsey.

Where did Churchill's interest lie, one may ask? Did he want to save the dictatorship in the Soviet Union, or save the British Empire? I believe that it was the interests of Britain which made Churchill write his letter. If

we can understand this, surely Stalin must have understood it as well? For Stalin, Churchill was not an unbiased observer who out of friendly sentiments was giving warning of danger, but a man in serious difficulties, needing help and allies in a conflict against a fearful enemy. Stalin therefore was very cautious towards Churchill's letters.

Churchill wrote several letters to Stalin. But unluckily they all reached Stalin at times when Churchill was in great difficulties. The best-known letter in this series reached Stalin on 19 April 1941. It has attracted considerable interest from historians, all of whom agree that it was a serious warning to Stalin. But let us consider Churchill's position rather than the text of the letter. The German Army took Belgrade on 12 April. Rommel reached the Egyptian frontier on 13 April. Yugoslavia surrendered to Germany on 14 April, and St Paul's Cathedral in London was damaged in an air raid on 16 April. Greece was on the point of surrender and British troops there were in a catastrophic situation; it had become a question of whether or not they could be evacuated.

Stalin might have suspected not only Churchill's motives, but also his sources of information. Churchill wrote the letters in June 1940. Why did Churchill not send similar letters to the French government and to his own troops on the Continent in May of that year?

Churchill had written to Stalin in April 1941, a month after the German armed forces executed a brilliant operation to capture Crete. Why was British intelligence, Stalin might have thought, working so well in the interests of the Soviet Union, while it was doing nothing in British interests?

Finally, there is a more serious reason why Stalin did not trust Churchill's 'warnings': contrary to popular belief, Churchill was not warning Stalin about a German invasion.

Communist propaganda has done much to build up the myth about Churchill's 'warnings'. Khrushchev used to quote Churchill's message of 18 April 1941 to Stalin in order to do this. V. Anfilov, that prominent Soviet military historian and highly refined falsifier of history, quotes the message in all his books. Zhukov gives the message in full, and General S. P. Ivanov does the same. The official *History of the Great Motherland*

War constantly hammers Churchill's warnings into our heads and quotes his 18 April message in full. The text of Churchill's message can be found in hundreds of Soviet books and articles:

I have received reliable information from a trustworthy source that the Germans, after deciding that Yugoslavia had fallen into their clutches, that is on 20 March, began to transfer three armoured divisions, of the five stationed in Romania, into the southern part of Poland. As soon as they learnt of the Serbian revolution, this transfer was cancelled. Your excellency will easily appreciate the significance of these facts.

All Soviet sources publish Churchill's message in this form, insisting and assuring that it was a 'warning'. I personally see no warning here. Churchill is talking about three tank divisions. This is many by Churchill's standards. By Stalin's, it is not a great deal. Stalin himself at the time was secretly setting up 63 tank divisions, each one of which was stronger than a German division both in number and quality of tanks. If we consider that a report about three tank divisions amounted to a 'warning' that aggression was in preparation, we need not in that case accuse Hitler of aggressive intentions. German intelligence had already submitted reports to Hitler about dozens of Soviet tank divisions which were grouping on the borders of Germany and Romania.

Churchill suggested that Stalin assess 'the significance of these facts'. How could they be assessed? Poland historically has always been the gate through which all aggressors have passed from Europe to Russia. Hitler wanted to transfer tanks to Poland, but he changed his mind.

Compared to Poland, Romania was a very bad springboard for aggression. German troops would be harder to supply there than in Poland. In an attack from Romania the road to the vital heartland of Russia would be longer and harder for an aggressor, who would have to overcome a multitude of barriers, including the lower reaches of the river Dnieper.

Had Stalin been preparing himself for defence, and had he believed Churchill's 'warning', he should have heaved a sigh of relief and relaxed his military preparations. In addition, Churchill gave the reason why the

German troops were staying in Romania instead of being transferred to Poland: the Germans had problems in Yugoslavia, particularly in Serbia.

Britain at that time was waging very intensive diplomatic and military activity throughout the entire Mediterranean basin, particularly in Greece and Yugoslavia. Churchill's telegram was of enormous importance, but it could in no way be regarded as a warning. It was to a much greater degree an invitation to Stalin. The Germans wanted to transfer divisions to Poland, but have been forced to divert them elsewhere. You have nothing to fear, more so since these divisions in Romania have their backs turned to you. Assess these facts and act!

When Stalin got into a critical situation in the war, he too sent similar messages to Churchill and Roosevelt: Germany is concentrating its main forces against me, with its back turned to you. This is the best time for you — open the second front quickly! Then again came the turn of the western allies. When they got into serious difficulties after opening the second front, the western leaders sent the same message to Stalin in January 1945 : can't you hit harder?

We are not justified in regarding Churchill's letters as a warning. Churchill wrote his first long letter to Stalin on 25 June 1940 before the Barbarossa plan even existed. Churchill's letters are founded on sober calculation rather than on knowledge of German plans. He was simply drawing Stalin's attention to the situation in Europe: Britain has problems with Hitler today, and the Soviet Union will surely have them tomorrow. Churchill was calling on Stalin to come into the war on the side of Britain.

Sir Basil Liddell-Hart, the prominent British military historian, made a brilliant analysis of the strategic situation of that time as seen from Hitler's standpoint. According to General Jodl, to whom Liddell-Hart refers, Hitler repeatedly told his generals that Britain's only hope was a Soviet invasion of Europe. (B. H. Liddell-Hart, *History of the Second World War*, Pan, London 1978, p. 151) Churchill himself wrote on 22 April 1941 that 'the Soviet government knows full well . . . that we stand in need of its help'. (L. Woodward, *British Foreign Policy in the Second World War*, p. 611) What help was Churchill expecting from Stalin, and how could Stalin give it, except by striking at Germany?

Stalin had sufficient grounds for not trusting Churchill. But even Stalin must have understood that had Britain fallen, he would have been left to face Germany alone. In his reply to Churchill's 25 June message, he says that 'the policy of the Soviet Union is to avoid war with Germany. But Germany might attack the Soviet Union in spring of 1941, if Britain has lost the war by then.' (R. Goralski, *World War II Almanac: 1931-1945*, Hamish Hamilton, London, p. 24)

It transpires from Stalin's answer that he intended to live in peace while patiently waiting for Britain to fall, and if he had been left alone face to face with Hitler, to wait for Germany to invade. Ah, how stupid Stalin was, some historians say indignantly. But let us not share their indignation. That message was addressed not to Churchill, but to Hitler! On 13 July 1940, Molotov was ordered by Stalin to hand over to Count von der Schulenburg, the German ambassador, the written record of Stalin's conversation with Sir Stafford Cripps, the British Ambassador. Was it not a strange thing to do, to have negotiations with Churchill through Sir Stafford Cripps, and then secretly pass the minutes of these negotiations to Hitler through his ambassador von der Schulenburg?

But Stalin did not pass the original memorandum to Hitler, only a carefully edited copy in which a mass of unnecessary detail was retained, but key sentences were completely altered. When the diplomatic veneer is stripped away, this is what the document was telling Hitler:

'Adolf, fight, and don't worry about your rear. Advance and don't look back, you have behind you your good friend Josef Stalin who only wants peace and who will never attack you under any circumstances.

'There have been negotiations here in Moscow with the British Ambassador. Don't worry, these negotiations are not directed against you. You see, I'm even sending you the secret minutes of my talks with Cripps. And I've sent Churchill to hell!' (In fact he had not).

Could the sweet siren songs from the Kremlin be believed? Many historians do believe them. But Hitler did not, and after thinking long and hard about the 'copy' of Stalin's conversation with Cripps, he issued the order on 21 July 1940 that a start should be made on the plan for Operation Barbarossa. In other words, Hitler decided to fight on two fronts. This decision seems inexplicable to many people. Many German generals and field-marshal did not understand it either, and they declined to approve such a truly suicidal decision. But Hitler had no choice.

He had gone increasingly further west, north and south, while Stalin stood back with his axe singing sweet songs of peace.

Hitler's one irremediable mistake was made, not on 21 July 1940, but on 19 August 1939. Once he had agreed to the signing of the Molotov-Ribbentrop Pact, Hitler was faced with an inevitable war against the West, while the 'neutral' Stalin stood behind him. From that moment onwards, Hitler had two fronts. His decision to set up Operation Barbarossa in the east without waiting for victory in the west was not a fatal error, but only an attempt to put right the fatal error he had already made. But by then it was too late. The war already had two fronts, and it was already impossible to win it. Even the capture of Moscow would not have solved Hitler's problem; beyond Moscow there still lay another 10,000 kilometres of boundless territory, vast centres of industrial power, inexhaustible natural and human resources. It is always easy to begin a war with Russia, but not so easy to finish it. It was certainly easy for Hitler to fight in the European part of the Soviet Union; the territory is limited, there are many good roads, and the winters are mild. Was Hitler ready to fight in Siberia in the unrestricted limitless expanse, where there were no roads and where the brutality of the frost is close to the brutality of Stalin's regime?

Stalin knew that war on two fronts would be suicide for Hitler. Stalin calculated that Hitler would not commit suicide, and that he would not begin a war in the east without having first ended the war in the west. Stalin was patiently waiting for the German tank corps to land in Britain. He was not alone in looking upon the brilliant airborne assault on Crete as a final rehearsal for landing in Britain. At the same time Stalin did everything possible to convince Hitler of his peaceableness. That was why Soviet anti-aircraft guns were not firing on German aircraft, while Soviet newspapers and TASS proclaimed that there would be no war between the Soviet Union and Germany.

Had Stalin succeeded in convincing Hitler that the Soviet Union was a neutral country, then the German tank corps without any doubt would have landed on the British Isles. And then a truly unprecedented situation would have arisen. Poland, Czechoslovakia, Denmark, Norway, Belgium, Holland, Luxembourg, Yugoslavia, France, Greece and Albania no longer had armies, governments, parliaments or political parties.

Millions of people had been driven into Nazi concentration camps and the whole of Europe was awaiting its liberation. All that remained on the European continent was the regiment of Hitler's personal guards, the guards of the Nazi concentration camps, German rear units, military schools and . . . five Soviet airborne assault corps, tens of thousands of fast tanks built specially for moving along motorways; tens of thousands of aircraft; pilots who had not been trained for fighting in the air, but who had been taught how to make air strikes on ground targets; divisions and whole armies of the NKVD; armies made up of prisoners from the Soviet labour camps; extra-high-power formations of the Glider Air Force to make rapid landings on enemy territory; mountain divisions trained to make swift thrusts into the mountain passes over which flowed oil, the life- blood of war.

Has anyone in history ever been in such a favourable position to 'liberate' Europe? And this situation did not come about by itself. Stalin, working long, persistently and in sustained fashion, had made a subtle mosaic from the smallest of fragments. It was Stalin who helped to bring Hitler to power, and made Hitler, in Stalin's phrase, a real icebreaker for the revolution. It was Stalin who encouraged the icebreaker to move into Europe. It was Stalin who demanded of the French and other communists that they should not prevent the icebreaker from breaking up Europe. It was Stalin who supplied the icebreaker with everything it needed for its victorious advance. It was Stalin who closed his eyes to all the crimes being committed by the Nazis and rejoiced in the pages of *Pravda* 'when the world was shaken to its foundations, when powers perished and greatness fell'.

But Hitler guessed Stalin's design. That was why World War II ended catastrophically for Stalin. He only got half of Europe, and some places here and there in Asia.

One final question. If Churchill did not warn Stalin that an invasion was being prepared, why do the communists hold on so tenaciously to the legend that he did? To show to the Soviet people that Churchill was a good man? Or to prove that the Western leaders were to be trusted? It was not, of course, for either purpose.

The communists need the legend of Churchill's warnings to justify their own preparations for war. The 'warnings' bolster the orthodox view that the 'big plan' for which such elaborate preparations had been made

was simply intended to forestall German aggression. 'We knew that Hitler was going to attack,' they say. 'It was Churchill who warned us . . .'

CHAPTER 30

Why Stalin Did Not Trust Richard Sorge

Stalin prepared himself very seriously for war. He showed particular concern for Soviet military intelligence which is known today as the GRU. It is sufficient to read through the list of all the GRU chiefs since the institution was set up prior to 1940 to appreciate Stalin's touching concern for his valiant intelligence officers:

Aralov	— arrested, spent several years under investigation, in which 'measures of physical coercion' were used
Stigga	— liquidated
Nikonov	— liquidated
Berzin	— liquidated
Unshlikht	— liquidated
Uritsky	— liquidated
Yezhov	— liquidated
Proskurov	— liquidated

It goes without saying that when the military intelligence chiefs were liquidated, their first deputies, their deputies, advisers and directors of their services boards and departments were liquidated as well. And when the heads of departments were liquidated, a shadow invariably fell over the executive officers and agents whom they were directing. The liquidation of the heads of military intelligence, therefore, meant the liquidation of the entire military intelligence.

It is said that this regular blood-letting had disastrous consequences for the intelligence service. This was not the case. Before, during and after World War II, the GRU was, and remains, the most powerful and effective intelligence service in the world. The GRU produces less secret information than its great opponent and competitor, the Ch.K. or KGB (the Soviet secret police), but the quality of its information is considerably

higher. The constant purging in no way weakened the power of Soviet military intelligence. On the contrary, as each generation succeeded its predecessor, it became more aggressive. This succession of generations is like the way in which a shark renews its teeth. The new teeth appear in complete rows, forcing out the old ones, while more and more rows of new teeth can already be seen behind them. The bigger the creature grows, the more teeth it has; the more often they are replaced, the longer and sharper they become.

Intelligence officers who were by Soviet standards innocent, frequently, indeed very frequently, perished in the rapid succession of generations. Strangely, however, the Soviet shark never ended up toothless because of it. Hitler exterminated a large number of ardent Nazis who belonged to the SA, one of the great mass Nazi organizations, without weakening his regime in any way.

The difference between Hitler and Stalin was that Stalin took his preparations for war very seriously. Stalin arranged nights of the long knives not just against his own communist storm-troopers, but against generals, marshals, designers and intelligence officers. Stalin believed that it was very important to accept briefcases crammed full of documents from his intelligence service. But he considered it even more important not to accept a briefcase from his intelligence service with a bomb in it. His thinking on this proceeded not only from considerations of his own personal safety, but from considerations of the state as well. The stability of the leadership in critical situations is one of the most vital factors in the preparations which any state makes for war.

Nobody ever pushed a bomb under Stalin's desk at a critical moment, and it was not just chance that this never happened. Through his sustained, single-minded terror against the GRU, Stalin not only obtained secret intelligence of high quality, but also guaranteed the supreme leadership of the country against 'unexpected events of all kinds' at times of crisis.

Richard Sorge was a spy from the row of teeth which Stalin, as a precaution, ordered to be pulled out on 29 July 1938. He was stationed in Tokyo, where he worked as a journalist under the alias 'Ramsay'. Soviet military intelligence was not so stupid as to publish Sorge's most interesting reports. But even the few which have been published lead us into an impasse:

January 1940: I am grateful for your greetings and wishes about my leave. If I go on leave however it will immediately reduce the information.

May 1940: It goes without saying that we are postponing the date of our return home because of the present military situation. May we assure you once again that this is not the time to raise this question.

October 1940: May I count on coming home after the end of the war?

This is a very odd correspondence. Every intelligence officer knows that he will be allowed to return home after a war. Yet Sorge puts the question again and again, listing the numerous services he has rendered to the Soviet regime. Every transmission in unbroken code from his clandestine radio station put Sorge's entire espionage organization at risk. Had his radio station—intended for agent-running and top-secret codes — really been created to enable Sorge to ask such questions?

A multitude of books and articles have been written about Sorge in the Soviet Union. Some of them ring with strange praise of him. He was such a great intelligence officer, such a true communist that he even spent his own money, which he had earned in his difficult work as a journalist, on his illegal work. What nonsense! Were the labour-camp prisoners in Kolyma no longer digging up gold? Had the GRU become so impoverished that Sorge had to dip into his own pocket? The weekly magazine *Ogonek* (No. 17, 1965), published an interesting report that Sorge was holding very important documents, but was unable to send them to the centre, because the centre had not sent a courier. *Ogonek* did not say why the centre had not sent a courier, adding another puzzling question to the case.

But the explanation was quite simple. While all this was going on, Yan Berzin, the brilliant chief of Soviet military intelligence who had recruited Richard Sorge, was liquidated after suffering appalling torture. Solomon Uritsky, another GRU chief who had personally given Sorge his instructions, was also liquidated. Gorev, the Soviet illegal resident who had fixed Sorge's passage from Germany, was in jail. (*Komsomol'skaya Pravda*, 8 October 1964) Aina Kuusinen, a secret collaborator of Sorge's who was married to a deputy head of the GRU who was both the President of the Finnish Democratic Republic and future member of the Politburo of the Central Committee of the CPSU, was also in jail. Ekaterina Maksimova, Sorge's wife, had been arrested,

admitted having links with enemies, and was liquidated. Karl Ramm, the illegal GRU resident in Shanghai and former deputy of Sorge's, was summoned back to Moscow 'on leave' and liquidated.

Then Sorge received the order to come back on leave. Soviet sources do not conceal the fact that 'Sorge refused to travel to the Soviet Union.' A good deal of material on this subject was published during the Khrushchev era, including the frank admission that 'Undoubtedly Sorge guessed what was awaiting him in Moscow.'

Not wishing to return to a certain death, Sorge continued to work for the communists, but now no longer in the role of a secret collaborator (*seksot* for short), but rather as an amateur informer, for his own satisfaction. Sorge had calculated carefully; I shan't go now, but after the war they will understand that I spoke only the truth. They can pardon, and appreciate. That was why he was paying agents out of his own pocket, and why there were no couriers speeding towards him. The centre did not lose contact with him until the end. It accepted his telegrams, but apparently only to reply 'Come home, come home, come home.' To which Ramsay replied 'Too busy, too busy, too busy . . .'

Stalin, therefore, did not trust Richard Sorge because he was a defector, with at least two capital sentences hanging over his head. One was due to his co-workers, who had denounced him in 1938 and put his name on the 'general list'. The other was added later for malicious defection. Comrade Sorge himself did not greatly trust Comrade Stalin, which is why he would not go back. How could Comrade Stalin trust someone who did not trust him?

Someone has made up the legend that Richard Sorge supposedly submitted highly important information about the German invasion to the GRU, but nobody believed him. Sorge was a very able intelligence officer, but he told Moscow nothing of significance about the German invasion. What is more, he fell victim to disinformation and fed the GRU with false reports. On 11 April 1941, he telegraphed Moscow that: 'The representative of the [German] General Staff in Tokyo has stated that war against the Soviet Union will begin immediately after the war in Europe ends.'

Hitler knew that it had already become impossible to conceal his preparations to invade the Soviet Union. He therefore said in secret, in a way that all should hear, 'Yes, I want to attack Stalin . . . after I have finished the war in the west.' We already know that exactly one month later, Stalin would do the same thing in his 'secret' speech when he said, 'Yes, I want to attack Hitler ... in 1942.'

If Sorge's telegram of 11 April (and other telegrams like it) were to be believed, there was no need to worry. The war in the west would continue, alternately dying down and flaring up with new force. But when the end of that war came, it would be obvious. It would then be possible to concentrate all the efforts of the German war machine on the east. In other words, said Sorge, Hitler intended to fight on one front only.

The GRU did not need Sorge to tell them this. After making a profound study of all the economic, political and military aspects of the situation, the GRU drew two conclusions: firstly, that Germany could not win a war on two fronts; and secondly, that Hitler would not begin a war in the east without first finishing the war in the west. The first conclusion proved correct. The second did not. Sometimes a war is started without any prospects of winning it.

Even before Sorge's 'warnings', Lieutenant-General Filip Ivanovich Golikov, the new head of the GRU, submitted a detailed report to Stalin on 20 March 1941, which concluded that 'the earliest possible date on which operations against the USSR may begin is the moment following victory over England or after an honourable peace for Germany has been concluded with her'.

But Stalin knew this simple truth without Golikov having to tell him. That is why Stalin replied to Churchill's letter of 25 June 1940 that Hitler might begin a war against the Soviet Union in 1941, *on condition* that Britain had ceased to resist by that time.

But Hitler, whom Stalin had driven into a strategic impasse with the Molotov-Ribbentrop Pact, suddenly realized that he had nothing to lose and that inevitably Germany had two fronts. He began to fight on two fronts. Neither Stalin nor Golikov expected this. It was a suicidal decision, but Hitler had no choice. Stalin simply could not understand that having found himself in a strategic impasse, Hitler would take such a suicidal step. General Golikov, the head of the GRU, had not contemplated this either. Sorge simply confirmed this view with the false information in his telegrams.

Later, on 15 June, Sorge correctly named the date of the German invasion as 22 June. But which Richard Sorge was to be believed? The one who said that Hitler would not fight on two fronts, or the one who said he would? Sorge's two reports cancel each other out. That apart, Sorge's reports were only reports. The GRU, quite rightly, does not believe any reports; what it requires is reports with proof.

Sorge was a great intelligence officer, and fully deserved his posthumously-awarded title of Hero of the Soviet Union. Sorge's greatness, however, was brought to bear not on Germany, but on Japan. S. Uritsky, when still head of the GRU, personally gave Sorge his mission: 'the point of your work in Tokyo is to deflect the possibility of a war between Japan and the USSR. Your main target is the Germany embassy.' (*Ogonek*, 1965, No. 14, p. 23) The German embassy was only a cover, to be used by Sorge to fulfil his main mission. His brief was not to warn about preparations for German invasion, but to deflect Japanese aggression onto another course.

Sorge is widely known to have told Stalin in autumn 1941 that Japan would not come into the war against the Soviet Union. Stalin used this extremely important information to withdraw dozens of Soviet divisions from the Far Eastern frontiers and to throw them into the fighting near Moscow, thereby changing the strategic situation in his favour.

What is less well known is the reason why Stalin believed Sorge on this occasion: he believed him because Sorge gave him proof. Soviet historians prefer to pass over this proof in silence, and that is understandable. If Sorge said that Japan would not move against the Soviet Union, he could only prove it by indicating another enemy, against whom Japan was in fact preparing a surprise attack.

As he followed his GRU brief, Sorge did not just forecast events. He directed them on a number of occasions. In August 1951 the United States Congress was examining the Sorge affair. In the course of the hearings it was proved beyond all shadow of doubt that, through the person of Ramsay, its illegal resident in Tokyo, Soviet Military Intelligence did a vast amount to ensure that Japan began an aggressive war in the Pacific, and that this aggression was directed against the United States. (*Hearings on American Aspects of the Richard*

Sorge Spy Case, House of Representatives 82nd Congress, First Session, 19, 22 and 23 August, Washington 1951)

Intelligence is the most thankless work in the world. It is the ones who fail who become famous, the ones who get hanged - like Sorge, for example. Stalin also had military intelligence officers whose achievements were truly outstanding; but, precisely because they were so successful, they remain entirely unknown to us. One Soviet intelligence officer had access to some of Hitler's real secrets. According to Marshal of the Soviet Union A. A. Gretchko, 'eleven days after Hitler accepted the final plan for the war against the Soviet Union (18 December 1940), this fact and the basic details of the decision taken by the German High Command became known to our intelligence organs'. (*VIZH* 1966, No. 6, p. 8)

We shall probably never learn the name of the great intelligence officer who performed this feat. It cannot be excluded that it was the same GRU resident who obtained the plan for Operation Citadel in 1943. But that is only my suggestion.

In December 1940, Lieutenant-General F. I. Golikov, the GRU chief, reported to Stalin that he had confirmed reports which indicated that Hitler had decided to fight on two fronts, that is, to attack the Soviet Union without waiting for the war in the west to end.

This highly important document was discussed in Stalin's presence in early January in a very restricted circle in the Soviet High Command. Stalin did not believe it, saying that any document could be forged. Stalin demanded of Golikov that he organize Soviet military intelligence in such a way that it would know at any moment whether Hitler was really preparing for war or just bluffing. Golikov reported that he had already done this. The GRU was attentively following a whole range of aspects of German military preparations, and from these the GRU would accurately identify the moment when preparations for invasion would begin. Stalin asked Golikov to explain how he could know this. Golikov answered that he could only tell Stalin personally and not anyone else. Subsequently, Golikov regularly reported to Stalin personally, and each time he told him that the preparations for invasion had not yet begun.

At the Politburo meeting held on 21 June 1941, Golikov reported on a massive concentration of German troops on the Soviet border, on enormous reserves of ammunition, on the regrouping of the German Air Force, on German deserters, and about other matters. Golikov knew the numbers of nearly all the German divisions, the names of their commanders, and where they were stationed. He knew many important secrets, including the name of Operation Barbarossa and the time of its inception. After giving his report, however, Golikov said that preparations for invasion had not yet begun, and without these preparations it was not possible for Germany to begin the war. In the course of the meeting Golikov was asked whether he could guarantee what he was saying. Golikov replied that he would answer for his information with his head, and if he were mistaken, then the Politburo would have the right to do to him what had been done to all his predecessors.

Some ten to twelve hours after he had said this, Operation Barbarossa began. What did Stalin do to Golikov? Do not fear, it was nothing bad. On 8 July Stalin entrusted Golikov with a trip to Britain and the United States, and briefed him personally. The visits were a success, and Golikov was then put in command of armies and fronts. In 1943 Stalin appointed him to the vitally important post of deputy to the People's Commissar for Defence, that is deputy to Stalin himself, to deal with cadre matters. Stalin allowed only his most trusted men to handle the delicate task of selecting and placing cadres. Beria, for instance, was never allowed to do this.

Golikov continued to rise in rank after Stalin died, and eventually became a Marshal of the Soviet Union. It is understandable that he should not say one word in his memoirs about how he covered German preparations for war, how he remained alive, or why he had such swift advancement after Operation Barbarossa.

If one recalls what happened to all his predecessors, to whom nothing resembling a German invasion ever happened, and compares their fate with what happened to Golikov, then one's bewilderment knows no bounds. The mystery of Golikov had been worrying me personally for a long time when I found the answer I was seeking in the Academy of the GRU. Later, when I was working in the central organization of the GRU, I found confirmation of this answer.

Golikov used to report to Stalin that Hitler was not preparing for war against the Soviet Union. It turned out that Golikov was reporting the truth to Stalin, for in reality Hitler was not making such preparations. Golikov knew that Stalin did not trust documents. Golikov did not trust them himself. He therefore looked for some

other indicators which would unerringly signal the moment when Hitler began his preparations for war with the Soviet Union. All the GRU residents in Europe were ordered to infiltrate organizations directly or indirectly connected with sheep farming. Over a period of months, intelligence was gathered and carefully processed on the numbers of sheep in Europe, on the main sheep-breeding centres and slaughterhouses. Golikov was informed twice a day about mutton prices in Europe.

In addition Soviet intelligence began to hunt for dirty cloths and oil-stained pieces of paper left behind by soldiers cleaning their weapons. There were many German troops in Europe. The troops were stationed in field conditions. Each soldier cleaned his weapon at least once a day. Cloths and paper which have been used for weapon cleaning are usually either burned or buried, but of course this rule was not always obeyed. The GRU had ample opportunity to collect an enormous quantity of dirty cloths.

Large amounts of these cloths were sent across the frontier, wrapped around various iron implements, so as not to arouse suspicion. Should any complications have arisen, the police would concentrate their attention on the inoffensive iron object, but not on the dirty cloth in which it was wrapped. In addition, considerably larger amounts than usual of kerosene lamps, gas stoves, primus stoves, lamps and lighters were sent across the border by both legal and illegal means. All this was analysed by hundreds of Soviet experts, and the results reported immediately to Golikov. He immediately informed Stalin that Hitler had not yet begun his preparations to invade the Soviet Union, so there was no need to pay heed to every build-up of German troops or German General Staff documents.

Golikov had good grounds for believing that very serious preparation was required for a war against the Soviet Union. One of the vital things which Germany would need if it were to be ready to fight such a war was sheepskin coats; no less than six million of them. As soon as Hitler decided to attack the Soviet Union, the General Staff would have to order industry to begin producing millions of sheepskin coats. This would be reflected immediately on the European markets. In spite of the war, mutton prices would fall because of the simultaneous slaughter of millions of animals, while sheepskin prices rise sharply.

Golikov also calculated that, if the German Army was going to fight in the Soviet Union, it would have to use a new type of lubricating oil for its weaponry. The German oil usually used on weapons would congeal in the frost, component parts would freeze together and the weapons would not work. Golikov waited for the German Army to change the type of oil it used in weapon-cleaning. Soviet expertise in dirty cloths showed that the

German Army was still using its usual oil, and there were no signs of a change over to a new type. Soviet experts also watched motor fuel. In heavy frost the normal German fuel broke down into incombustible particles. Golikov knew that if Hitler decided to open a second front, he would have to order the mass production of a fuel which would not disintegrate in heavy frost. It was samples of German liquid fuel which Soviet intelligence was sending over the border in lighters and lamps.

The GRU had many other ploys like these which would have served as warning signals. They proved useless for the simple reason that Hitler set Operation Barbarossa in motion without making any preparations at all. Why Hitler acted like this will surely remain a mystery. The German Army was built for war in western Europe, but Hitler did nothing to prepare his army for war in Russia.

Stalin therefore had no reason to punish Golikov, who had done everything humanly possible to discover German preparations for an invasion. He told Stalin that no preparations were taking place, and this was the simple truth. There had only been a great build-up of German troops. Golikov gave instructions that not all German divisions should be targets of attention, but only those which were ready to invade; those divisions, that is, which each had 15,000 sheepskin coats in its storage depots. There were simply no such divisions ready for war throughout the entire Wehrmacht. Golikov could hardly be blamed for not seeing any preparations for invasion when no serious preparations existed.

CHAPTER 31

How Hitler Frustrated Stalin's War

*We have been fully prepared for an aggressive war.
It was not our fault that we were not the ones to
carry out the aggression.*

Major-General P. GRIGORENKO
(*Memoirs: 'Dentinez'*, New York 1981,
P. 138)

On 17 June 1945, a group of Soviet military investigators were interrogating some senior Nazi military leaders. In the course of his interrogation, Field-Marshal Keitel maintained that

all the preparatory measures we took before spring 1941 were defensive measures against the contingency of a possible attack by the Red Army. Thus the entire war in the East, to a known degree, may be termed a preventive war . . . We decided ...to forestall an attack by Soviet Russia and to destroy its armed forces with a surprise attack. By spring 1941, I had formed the definite opinion that the heavy buildup of Russian troops, and their attack on Germany which would follow, would place us, in both economic and strategic terms, in an exceptionally critical situation . . . Our attack was the immediate consequence of this threat . . .

Colonel-General Alfred Jodl, the main author of the German military plans, adopted the same stance. The Soviet investigators did their best to force Keitel and Jodl out of their postures, but did not succeed. Keitel and Jodl did not change their testimony and, along with the principal war criminals, were sentenced to be hanged by the international tribunal at Nuremberg. One of the main accusations against them was 'the unleashing of an unprovoked aggressive war' against the Soviet Union.

Twenty years went by and new evidence appeared. Admiral of the Fleet of the Soviet Union N. G. Kuznetsov was, in 1941, an admiral, People's Commissar for the Navy, member of the Central Committee of the Party, member of Stavka from the time it was set up. In the 19603, he shed some startling new light on the matter:

For me there is one thing beyond all argument - J. V. Stalin not only did not exclude the possibility of war with Hitler's Germany, on the contrary, he considered such a war . . . inevitable . . . J. V. Stalin made preparations for war . . . wide and varied preparations - beginning on dates . . . which he himself had selected. Hitler upset his calculations. (*Nakunune*, Moscow Voenizdat 1966, p. 321)

The admiral is telling us quite clearly and openly that Stalin considered war inevitable and prepared himself seriously to enter it at a time of his own choosing. In other words, Stalin was preparing to strike the first blow, that is to commit aggression against Germany; but Hitler dealt a preventive blow first and thereby frustrated all Stalin's plans.

Admiral Kuznetsov is a witness of the highest rank. In 1941, he was even more highly placed in the Soviet military-political hierarchy than Zhukov. Kuznetsov was a People's Commissar; Zhukov was a deputy People's Commissar. Kuznetsov was a member of the Central Committee; Zhukov was only a candidate member. Not one of those who have written their memoirs was as highly placed as Kuznetsov in 1941, and no one was closer to Stalin than he.

What Kuznetsov says after the war, incidentally, is in full accord with what he said before the war, for instance at the 18th Party Congress in 1939. This was the Congress which marked out a new path: to reduce the terror inside the country and to transfer it to the Soviet Union's neighbours. At this Congress, Kuznetsov's speech was perhaps the most aggressive. It was for this speech that Kuznetsov was made a member of the Central Committee at the end of the Congress, passing over the candidate-member level, and given the post of People's Commissar.

Everything which Kuznetsov said openly had been said many years before by Stalin in his secret speeches. Everything which Kuznetsov said has been borne out by what the Red Army and Fleet actually did. Finally,

Admiral Kuznetsov has to be believed in this case, because his book has been read by all friends and enemies alike; it has been read by political and military leaders in the Soviet Union; it has been read by marshals, diplomats, historians, generals and admirals; it has been read by paid friends of the Soviet Union abroad, and nobody has ever tried to deny Kuznetsov's words.

Let us compare Keitel's words with those of Kuznetsov. Field-Marshal Keitel said that Germany was not preparing an aggression against the Soviet Union; it was the Soviet Union which was preparing the aggression. Germany was simply using a preventive attack to defend itself from an unavoidable aggression. Kuznetsov says the same thing — yes, the Soviet Union was preparing for war and would inevitably have entered into it, but Hitler disrupted these plans with his attack. What I cannot understand is why Keitel was hanged, and Kuznetsov was not.

Soviet marshals and generals do not hide their intentions. General S. P. Ivanov, Chief of the General Staff Academy of the Armed Forces of the USSR, along with a group of leading Soviet historians, wrote a scientific paper entitled *The Initial Period of War (Nachal'nyi Period Voyny*, Moscow Voenizdat 1974), in which he not only admits that Hitler launched a preventive attack, but also puts a time to it: 'the Nazi command succeeded in forestalling our troops literally in the last two weeks before the war began', (p. 212)

Another open declaration of Soviet intentions in 1941 can be found in the *Military Historical Journal (VIZH* 1984, No. 4) The journal is the official publication of the Soviet Ministry of Defence, and cannot be published without the stamp of the Minister of Defence and the Chief of the General Staff. (At the time these were, respectively, Marshals of the Soviet Union S. Sokolov and S. Akhromeev). The *Military Historical Journal* explained why such great stockpiled reserves of ammunition, liquid fuel and provisions were built up so close to the frontier. The explanation was simple: they were for offensive operations, (p. 34) It is stated quite openly on the same page that the German attack disrupted the Soviet plans.

Had the Red Army been preparing for defence or even a counter-attack, it would have been no simple matter to disrupt its plans. Quite the contrary, for a German invasion would have served as a signal to Soviet troops to act according to plans which had already been drawn up. Only if the Red Army had intended to

attack could the German invasion have disrupted its plans. Soviet troops would then be compelled to defend themselves, that is to improvise, and act in a situation which had not been envisaged.

On 6 June 1941, German intelligence received information that the Soviets intended to transfer their seat of government to Sverdlovsk. Only Hitler and those closest to him were informed about it. Dr Goebbels noted in his diary that he had received such a report, and spoke very unflatteringly about the Soviet government's intention to run away further to the east.

Only now, several decades later, can we evaluate the report on its merits. We now know that a *decoy command post* had been built in Sverdlovsk. It was only during the war that it turned out that it was not Sverdlovsk which was to be the emergency capital, but Kuibyshev. Even Kuibyshev, however, was not the whole truth, but only half of it. The institutions which were set up in Kuibyshev were those whose loss did not affect the stability of the country's top military and political leadership, such as the Supreme Soviet with 'President' Kalinin, unimportant people's commissariats, and embassies.

All the important bodies were located nearby, not in Kuibyshev itself, but in great underground tunnels hewn out of the Zhiguli rocks. Before the war the construction of this giant had been disguised by the building of the Kuibyshev hydro-electric power station. Thousands of labour-camp prisoners, thousands of tons of construction materials and building machinery were sent there and everybody knew why. It was to build the hydroelectric power station. After the war the entire gigantic edifice was moved higher upriver on the Volga, and the hydro-electric station arose on a new site. The original site had been selected in a place where a power station should not have been built but which was an eminently suitable place for an underground command post.

I found no mention in pre-war German archives of Kuibyshev as the emergency capital, or of the underground command post in Zhiguli. German intelligence only had information about the transfer of the Soviet government to a command post in Sverdlovsk. But a government cannot move to a command post which does not exist. Who was spreading these reports about the transfer to a fictitious command post? This could only have been done by the person who invented the bogus command post in the first place, that is the

Soviet government, or more exactly, the head of that government, Stalin. That bogus command post was created so that the enemy should find out about it one day. That day came, and German intelligence acquired the secret which had been specially manufactured for it.

If German intelligence obtained a false report about Soviet government intentions, it meant that the Soviet government itself must have been trying to conceal something at the time. It is not difficult to guess what. If the Soviet leaders were spreading false information about their intention to move eastwards, it meant without any doubt that they were going to do the opposite.

The subtlety was that, in addition to the powerful Zhiguli command post, whose location was difficult though not impossible to establish, there was another government command post. It was a railway train. In the event of war, this command post, under cover of several armoured trains of the NKVD and accompanied by three trains belonging to the People's Commissariat for Communications, could go at any time to any area where hostilities were in progress. This capability to move alongside an area where the main events of the war were taking place was reflected in the name of the train-the PGKP, or Main Forward Command Post. Several carefully hidden, camouflaged stations were built expressly for this command post. Government telegraph lines were led into these stations before the war, and all the trains had to do was to plug into them with their own communications equipment.

There is no need to explain that the mobile command post was intended for an offensive war; in a situation where the troops are rapidly pressing forward, the command, with its cumbersome paraphernalia of control and communications, must keep up with them. In a defensive war, on the other hand, it is simpler, more reliable and safer to exercise direction from an office in the Kremlin, from an underground station in the Moscow Metro, or even from the tunnels of Zhiguli.

Were we to gather up all available snippets of information and put them together, we should be able to conclude with a fair degree of certainty that a very high-calibre command post had been established, or must have been established nearer to Vilnius, on the Minsk-Vilnius main railway line. Several days after the German leaders received their 'secret' report about the Soviet government's transfer eastwards, the Soviet government began its secret move towards the Soviet western frontier near Minsk and Vilnius.

Every military man knows how a large headquarters is moved in exercises or in a combat situation. The operations branch selects the site for the future headquarters, the senior commander approves the site and then authorizes the move there. The forest where the headquarters will be located is cordoned off, in order to keep out unauthorized persons. Then sappers and signallers appear to build shelters and a communications system. Then the head of communications turns up and personally checks that the communications are functioning reliably. Finally, when that has been done, the headquarters itself arrives. All its officers have to do is to plug in their telephones and enciphering machines.

In 1941, the Red Army was functioning like a single well-oiled machine. Dozens of officers in charge of signals in rifle and mechanized corps appeared in the forests near the border. The secret deployment of the command posts of these corps followed in their wake. Immediately after this, the signals chiefs of the armies turned up in other forests. Their appearance was a sign that army headquarters would shortly arrive. Sure enough, the headquarters did indeed turn up. It was exactly on the day that the TASS report was published that the signals chiefs of the fronts appeared in secluded corners of these prohibited, well guarded woods. After the communications had been checked, the front headquarters secretly moved their columns to their new positions.

The moment then arrived for the most important signals chief of all to appear, 150 kilometres from the East Prussian frontier. I. T. Peresypkin, People's Commissar for Communications, secretly moved to Vilnius. Can we guess for whom Peresypkin was going to check communications there? People's Commissar Peresypkin has only one direct superior, and that is the Chairman of the Council of People's Commissars, Comrade J. V. Stalin himself.

The People's Commissar for Communications went to the East Prussian frontier in such a way that no one could know about it. He travelled in an ordinary train running to the regular timetable but with an additional special wagon, for Peresypkin and his deputy, coupled on to it. The journey of the People's Commissar for Communications was a total secret. He even received encoded messages from Moscow signed in his own name, so that the cipher clerks should believe that Peresypkin was still in Moscow.

Peresypkin's own account of his journey is revealing:

Literally on the eve of war, J. V. Stalin sent me to the Baltic republics. I somehow mentally linked this crucial mission with approaching military events. On the evening of 21 June 1941, I travelled to Vilnius along with a group of executives from the People's Commissariat for Communications. The war broke out while we were on the way . . . (*Svyazisty v Gody Velikoi Otechestvennoi*, Moscow Svyaz' 1972, p. 17)

On the morning of 22 June, while he was at the Orsha railway station, Peresypkin received a telegram from Moscow: IN CONNECTION WITH CHANGE IN SITUATION DO YOU NOT THINK IT NECESSARY TO RETURN MOSCOW? PERESYPKIN. (*Ibid*, pp. 32-33)

Peresypkin was travelling on a railway system which not only had been completely turned over to the military, but which had been ordered a few days before to place itself on a war footing and to be ready to work under conditions of war. (V. Anfilov, *Bessmertnyi Podvig*, 1971, p. 184) Having been ordered to take with him 'only what is necessary for life and battle', Peresypkin went to an area where troops were being secretly concentrated in vast numbers on the frontier, and where a government command post was being secretly set up. Travelling on Stalin's personal orders, Peresypkin knew that his journey 'was connected with approaching military events'.

But as soon as Hitler attacked, Peresypkin abandoned his secret railway wagon and rushed back to Moscow on a lorry which happened to come to hand. Had Hitler not attacked, then Comrade Peresypkin, People's Commissar for Communications, would have gone to the secret command post near Vilnius to co-ordinate the military, governmental and state communications systems during the war. The German attack constituted such a serious change in the situation that it caused the Soviet government to abandon many of its most important measures and compelled it to improvise, even to the extent of a People's Commissar having to return to Moscow on the back of the first lorry he could lay his hands on.

It had been planned that leading figures in the People's Commissariat for Defence, the NKVD, the People's Commissariat for State Control, and other important Soviet governing bodies, should move into the

western areas that same night, travelling along the same Moscow—Minsk railway line. The purpose of that journey was war. Among the leaders of the Stalinist empire who were getting ready that night to make the secret journey to the western borders were the People's Commissar for the Interior, candidate member of the Politburo and Commissar General for State Security, L. P. Beria; member of the Central Committee, People's Commissar for State Control, Grade I Army Commissar L. Z. Mekhlis; and candidate member of the Central Committee, People's Commissar for Defence, Marshal of the Soviet Union S. K. Timoshenko. It cannot be excluded that even Stalin was also preparing himself to make that secret journey westwards.

Mixed groups were then formed consisting of the most senior executives from those People's Commissariats which would be most important in wartime. Each of these groups was then allotted to a leader. By the morning of 21 June the formation of these operational groups was completed, and all their members knew that they were going to war.

Surprisingly, however, nobody, including the group leaders then sitting in the Kremlin, even suspected that a German invasion was then in preparation. Even more surprisingly, when reports that an invasion was under way came flooding in that evening, the top Soviet leaders refused to believe them. Then directives and shouts down the telephone poured out to the frontier from the Kremlin, from the People's Commissariat for Defence, and from the General Staff: 'Don't give in to provocation!'

If the Soviet leaders did not believe that a German invasion was possible, for what war were they preparing themselves? There can be only one answer. They were preparing themselves for a war which would begin *without the German invasion*.

The groups who were to accompany the leaders spent many weary hours waiting before being told at 6 o'clock in the morning of 22 June that their trains to the western frontier had been cancelled, since Hitler had started the war. If it had been the intention of the Soviet leaders to travel to the western borders to man the secret command posts in order to contain a German invasion, they would have hurried westwards as soon as they had received a signal that such an invasion had begun. Instead, they cancelled their trains which were to have taken them to war. They were ready to turn up on the frontier and direct a war, but one which began as part of a Soviet scenario, and not a German one. Hitler deprived them of this satisfaction.

On 21 June 1941, Dmitri Ortenberg was head of the organizational instructors department of the People's Commissariat for State Control. He himself described his job as 'dealing with military ideas - a sort of chief of staff. His account vividly evokes the events of that night:

Sometimes they would ask me, 'When did you leave for the war?'

'Twenty first of June.'

'What?!'

Yes, it was like this ... In the morning I was called into the People's Commissariat for Defence and told that a group of officials from the Commissariat headed by Marshal S. K. Timoshenko was leaving for Minsk. I was notified that I was to go with it. They suggested that I should go back home, put on military uniform and report back to the Commissariat . . . The waiting-room of the People's Commissar for Defence was choc-a-bloc full of military people, carrying files and maps, and obviously excited. They spoke in whispers. Timoshenko had gone to the Kremlin . . . The Commissar got back from the Kremlin about five o'clock in the morning of 22 June. He called me:

'The Germans have started the war. Our trip to Minsk has been cancelled.' (Ortenberg, *lyun' Dekabr' Sorok Pervogo*, Sovetsky Pisatel' 1984, pp. 5-6)

Nobody knows where the legend has come from that on 22 June 1941 Hitler began the war in the east, almost having to drag the Soviet Union into it by force. If we listen to those officers - from Kuznetzov to Ortenberg — who were right alongside the most important Soviet leaders in those minutes, hours and days, everything appears quite differently. On 22 June 1941 Hitler spoilt the war by carrying it on to the territory where it had been planned on 19 August 1939. Hitler did not allow the Soviet leaders to wage the war as they had intended. He forced them to improvise and do something for which they were unprepared: to defend their own territory.

CHAPTER 32

Did Stalin Have a War Plan?

Since Stalin never explained or expounded his points of view or his plans, many people thought that he did not have any. This was a typical error made by talkative intellectuals.

ROBERT CONQUEST
(The Great Terror)

'Strategic defence was an involuntary form of combat operations, it had not been planned beforehand.' That is what the Soviet military textbooks say. We do not need the textbooks, though, to tell us that in the summer of 1941, the Red Army's defensive operations were pure improvisation. Before the war, the Red Army had not been preparing itself for defence, nor had it ever held any exercises to practise defensive subjects. Soviet regulations contain not one word about defence on a strategic scale. Even in the purely theoretical field, problems of how to conduct defensive operations had never been worked out. What is more, neither the Soviet people nor its army had even been prepared psychologically for defence. People and army alike had been trained to do defensive things by using offensive methods: 'It is precisely the interests of defence which demand that the USSR should conduct extensive offensive operations on enemy territory, and this in no way contradicts the nature of a defensive war.' (*Pravda*, 19 August 1939)

In the first hours following the beginning of the German invasion, the Red Army kept on trying to go over to the offensive. Modern textbooks call what the Red Army was doing counter-strikes and counter-offensives. But it was pure improvisation. The problem of counter-strikes had never been worked through in any pre-war exercises, nor indeed had it ever been considered in theoretical terms: 'the subject of counter-offensive . . . had never been raised before the Great Motherland War'. (*I VOSS* (the official history of the 'Great Patriotic War'), Vol. i, p. 441)

Before the war, therefore, Soviet military staffs did not work out any plans for defence, nor did they work out any for a counter-offensive either. Yet they were working very hard on war plans. According to Marshal of the Soviet Union A. M. Vasi-levsky, in the year preceding the war, the officers and generals of the General Staff, the headquarters of the Military Districts and the naval fleets were working fifteen to seventeen hours a day, with no holidays or days off. Marshals Bagramyan and Sokol-ovsky, Generals Shtemenko, Kurasov, Malandin and many others say the same thing. General Anisov reportedly worked a 20-hour day, and the same was said of General Smorodinov.

General Zhukov became chief of the General Staff in February 1941. The General Staff in effect went on to a war footing from that moment. Zhukov himself worked assiduously and did not allow anyone else to slacken. In the summer of 1939, Zhukov, still holding his rank of *komkor*, had appeared in Khalkhin-Gol. He personally got to know the situation, quickly drew up plans, and began to carry them out with a vengeance. The slightest carelessness on the part of any subordinate meant immediate death. In the course of a few days Zhukov put seventeen officers on trial, demanding that they be sentenced to death. The tribunal immediately passed death sentences on all of them. Of the seventeen, one was saved on the intervention of the senior command, and the rest were shot. By February 1941, Zhukov had risen to great heights. His authority had increased several fold, and there was nobody who could save any poor unfortunate from his anger. General Staff veterans recall Zhukov's rule as the most terrible period in history, even more terrible than that of the Great Purge. At that time the General Staff, and all other staffs, were working under inhuman pressure.

So how could it have happened that the Red Army went into the war without plans? There is something else which cannot be understood. If the Red Army went to war without any plans, then why did Stalin not shoot Zhukov, and all those who should have been helping to make the plans, as soon as he learnt about it? That did not happen. On the contrary, those involved in making the Soviet plans, such as Vasilevsky, Sokolovsky, Vatutin, Malandin, Bagramyan, Shtemenko and Kurasov, who had all begun the war as major-generals or even colonels, ended it, if not as marshals, then at least as four-star generals. They all showed themselves to be brilliant strategists in the course of the war. They were all conscientious and even pedantic staff officers, who could not conceive of life without a plan. So how could it come about that the Red Army was compelled to improvise in the first months of the war? And why did Stalin not even reproach Zhukov and his planners, let alone shoot them?

When asked the straight question as to whether the Soviet command had any war plans, Zhukov replied categorically that it did have such plans. Then another question arises: if there were plans, why did the Red Army operate in an uncontrolled mass, without any plans at all? Zhukov has never answered this question. But here the answer suggests itself. If Soviet staffs were working very hard to make war plans, and these were neither defensive plans or plans for counter-offensive, then what kind of plans were they? Purely offensive plans.

Stalin did not shoot Zhukov and the other war-planners for one very simple reason. They had never been given the job of working out plans for a *defensive* war. Of what then could they be accused? Stalin gave the task of making plans of some other kind to Zhukov, Vasilevsky, Sokolovsky and other outstanding strategists. These were very good plans, but the moment the defensive war began they became unnecessary, just like the motorway tanks and the airborne assault corps.

Murder will out. The Soviet High Command took measures to destroy everything related to Soviet pre-war war plans. But these plans were held by all the fronts, all fleets, dozens of armies, more than one hundred corps, all warships, hundreds of divisions, and thousands of regiments and battalions. Something must have survived.

Research carried out by the Academy of Sciences of the USSR has shown that before the war the operational mission of the Soviet Black Sea Fleet was to undertake 'active hostilities against enemy ships and transport near the Bosphorus and in the approaches to enemy bases, and also to co-operate with land troops as they move along the Black Sea Coast'. (*Plot v VO V*, Moscow Nauka 1980, p. 117)

Admiral of the Fleet of the Soviet Union Sergei Georgiyevich Gorshkov has said that, as well as the Black Sea Fleet, the Baltic and Arctic Fleets had been given purely defensive missions, but it was planned that these missions should be carried out by purely offensive methods. This was standard Soviet thinking before the war, and was expressed both at secret meetings in the Soviet command, and openly in *Pravda*: 'To wage a defensive war in no way means to stand on the borders of one's own country. The best form of defence is a swift advance until the enemy has been completely destroyed on his own territory.' (14 August 1939)

Operations of the Soviet fleets in the first minutes, hours and days of the war show sufficiently clearly that they did have plans, but that these were not plans for defence. On 22 June 1941, Soviet submarines of the Black Sea Fleet immediately put to sea and headed for the coasts of Romania, Bulgaria and Turkey. The same day submarines of the Baltic Fleet set sail for the coasts of Germany, with a mission to 'sink all enemy ships and vessels, in accordance with the rights of unrestricted submarine warfare'. (Order of Officer Commanding Baltic Fleet, 22 June 1941, *Plot v Velikoi Otechestvennoi Voine*, Moscow Nauka 1980, p. 279) The order did not even make an exception for hospital ships flying the Red Cross flag.

Beginning on 22 June, the air arm of the Black Sea Fleet carried out active combat operations in support of the Danube Naval Flotilla with the objective of opening a way upstream for the flotilla. On 25—26 June, surface warships of the Black Sea Fleet appeared off the Romanian port of Constanza and began an intensive artillery bombardment with the obvious intention of making a naval assault landing. At the same time the Danube Naval Flotilla began to carry out assault landing operations in the Danube Delta.

On 22 June, the garrison at the naval base at Hanko, on Finnish territory, instead of going over to a stonewall defence, initiated some sustained assault landing operations, and held nineteen Finnish islands for several days. On 25 June, in spite of the enormous losses which the Soviet Air Forces had sustained in the first hours of the war, 487 aircraft belonging to the Baltic and Arctic Fleets launched a surprise strike at Finnish airfields. Again in spite of these enormous losses, the Soviet air forces conducted themselves with exceptional valour and aggression. On 22 June the 1st Air Corps made a concentrated raid on military objectives in Königsberg.

None of this was improvisation. At 6.44 am on 22 June the Soviet Air Force was given the mission of operating in accordance with its plans, and for a few days it tried to do this. On 26 June, the 4th Air Corps began bombing raids on the Ploesti oilfields in Romania. During the few days' duration of these raids, oil output in Romania fell almost by half. Even in conditions where practically the whole of the Soviet Air Force had been destroyed on the ground, it still found sufficient strength to wreak great damage on the Romanian oilfields. In any other situation the Soviet Air Force would have been even more dangerous, and could have paralysed completely Germany's military, industrial and transport power with its operations against these oil-producing areas. Hitler understood this threat only too well, and considered that his only defence was to invade the Soviet Union.

On 22 June 1941, the 41st Rifle Division of the 6th Army's 6th Rifle Corps, without waiting for orders from above, crossed the state frontier near Raval-Russkaya. That same morning, and without waiting for orders from Moscow, Colonel-General F. I. Kuznetsov, officer commanding the North-West Front, ordered his troops to launch an attack towards Tilsit in East Prussia. This decision came as no surprise either to the headquarters staff of the North-West Front or to the officers commanding the armies and their staffs, for a version of the attack on Tilsit had been played out in headquarters exercises held a few days previously, 'and it was very familiar to the commanders of the formations and their headquarters'. (*Bor'ba za Sovetskuyu Pribaltiku*, Eesti Raamat, Tallinn 1980, Vol. i, p. 67) Colonel-General Kuznetsov simply put the pre-war plan into action. On the evening of the same day, the Soviet High Command, still unaware of General Kuznetsov's operations, ordered him to do precisely what he was doing already, that is, to attack Tilsit. The High Command gave the adjacent Western Front the task of launching an extra-high-power attack in the direction of the Polish town of Suwalki. And that came as no surprise either to General D. G. Pavlov, the officer commanding the Western Front. He himself knew what his front had to do, and had already given the order to advance on Suwalki long before the directive to do so arrived from Moscow. To advance was hardly the best thing to do, however, when the German Air Force had not been destroyed on the ground as planned, and the Soviet Western Front had itself lost 73 8 aircraft in the first hours of the war.

This operational mission had been spelt out to all Soviet commanders. Of course, the commanders at tactical level were not entitled to know what their tasks would be, but in the senior headquarters, these tasks had been exactly defined and formulated, placed under seal in secret envelopes, and kept in the safe in every headquarters, up to and including the level of battalion. For instance, the Reconnaissance Battalion of the 27th Rifle Division, concentrated close to the frontier near the town of Augustow, was preparing to carry out combat reconnaissance in the direction of Suwalki. (Arkhir MO SSSR, Archive 181, list 1631, item i, p. 128) The task of the Reconnaissance Battalion was to ensure the swift advance of the entire 27th Division from near Augustow to Suwalki. We know even more about this from overt sources than we do from pre-war archives. Enormous Soviet forces were concentrated near Augustow. That was the place where the Soviet frontier guards had been cutting the barbed wire on their frontier. That was the place where Lieutenant-General V. I. Kuznetsov, officer commanding the 3rd Army, and High Command Representative Lieutenant-General of Engineering Troops, D. Karbyshev, had spent long hours surveying German territory from frontier

posts. That was the very place where General Karbyshev had been training assault groups to cut off and neutralize the enemy's reinforced-concrete defensive installations.

Enormous numbers of Soviet troops had been assembled near Augustow long before the war. Right on the frontier and flowing parallel with it on Soviet territory is the Augustow Canal. If defence had been in preparation, the troops would have deployed behind the canal, using it as an impassable anti-tank ditch. But the Soviet troops crossed over to the western bank of the canal and deployed on the narrow stretch of terrain between the canal and the frontier, from which all barbed wire had been removed. At dawn on 22 June, thousands of Soviet soldiers were wiped out by sudden destructive fire. The troops, with the canal behind them, had nowhere to go to retreat.

Is not this perhaps just the usual Russian stupidity? Not at all. German troops had also been assembled in great numbers right up against the frontier, from which they also had removed their barbed wire. Had the Red Army attacked the day before, the losses on the other side would have been no less. Deployment of troops right on the frontier is exceptionally dangerous in the event of the enemy launching a surprise attack, but a deployment of that nature is eminently suitable for launching such an attack. Both armies were doing the same thing.

Soviet generals never concealed that it was offensive tasks which they had been given. General K. Galitsky, when speaking of the concentration of Soviet troops near Augustow, insists that the Soviet High Command did not believe that a German offensive was possible, while the Soviet troops were preparing to carry out an offensive operation. And since the Soviet fronts facing East Prussia and Poland were preparing only for an offensive, it follows that the fronts concentrated against Romania, Bulgaria, Hungary and Czechoslovakia must also have long been preparing themselves only for an offensive as well. Major-General A. I. Mikhalev frankly admits that the Soviet High Command did not plan to use either the Southern or South-West Fronts for defensive or counter-offensive operations: 'it was intended that the strategic aims should be to have the troops of the fronts go over to decisive offensive'. (VIZH 1986, No. 5, P- 49)

Whether we believe the Soviet publications or not, the Red Army operations in the first days of the war are the best evidence of Soviet intentions. Zhukov, who co-ordinated the operations of the Southern and South-West Fronts aimed at Romania, Bulgaria, Hungary and Czechoslovakia, went on insisting on offensives until 30 June 1941, and demanded nothing but offensives from the officers commanding the fronts. It was only in

July that he and his colleagues came to the conclusion that the Red Army would no longer find it all that easy to advance.

It would be a mistake to underestimate the enormous strength and vast resources of Stalin's war machine. Despite its grievous losses, it had enough strength to withdraw and gather new strength to reach Berlin. How far would it have gone had it not sustained that massive blow on 22 June, if hundreds of aircraft and thousands of tanks had not been lost, had it been the Red Army and not the Wehrmacht which struck the first blow? Did the German Army have the territorial expanse behind it for withdrawal? Did it have the inexhaustible human resources, and the time, to restore its army after the first Soviet surprise attack? Did the German generals have any defensive plans?

CHAPTER 33

The War Which Never Was

*The Russian High Command knows its job better
than the High Command of any other army.*

General V. F. Von MELLENTIN
(*PanzerBattles*, London 1977, p. 353)

Hitler considered that a Soviet invasion was inevitable, but he did not expect it to happen in the very near future. German troops were diverted to activities of secondary importance, and the beginning of Operation Barbarossa was postponed. The operation finally began on 22 June 1941. Hitler himself clearly did not realize what a tremendous stroke of luck he had had. If Operation Barbarossa had been put off again, say from 22 June to 22 July, Hitler would have had to do away with himself considerably earlier than in 1945.

There are quite a few indications that the date for the beginning of the Soviet Operation Groza ('Thunderstorm') was fixed for 6 July 1941. Memoirs of Soviet marshals, generals and admirals, archival documents, the mathematical analysis of information or the movements of thousands of Soviet military railway trains all point to 10 July as the date on which the full concentration of the Second Strategic Echelon of the Red Army would be achieved on the Soviet western borders. Soviet military theory, however, lays down that the move over to a decisive offensive should not follow *but precede* the full concentration of troops. In that event, a number of those military trains belonging to the Second Strategic Echelon could have been off-loaded directly on enemy territory, for its troops to go directly into battle.

Zhukov and Stalin liked to deliver their surprise strikes on Sunday mornings, and 6 July 1941 was the last Sunday before the concentration of Soviet troops was complete. General Ivanov's statement directly points to this date: 'The German troops succeeded in forestalling us literally by two weeks.'

Let us suppose that Hitler had once again put back the date on which Barbarossa was to be launched by three to four weeks. Let us try to imagine what would have happened then. We do not need to exert our imagination. It is sufficient to look at the groupings of Soviet troops, at the unprecedented concentration of troops, at the airfields right up against the frontier, at the airborne assault corps and the motorway tanks, at the accumulation of submarines in frontier ports or at air assault gliders at forward airfields. It is sufficient for us to open Soviet pre-war military-regulation books, textbooks of Soviet military academies and schools, and the newspapers *Red Star* and *Pravda*.

The German troops are making intensive preparations for the invasion, which is fixed for . . . 22 *July* 1941. The concentration of troops is proceeding: military trains are off-loading at stations and halts; the forests near the borders are full of troops; at night groups of aircraft from distant airfields fly over the field aerodromes located right on the frontier; and there is feverish building of new roads and bridges. In a word, everything is just as it is in the Red Army. On the other side, the Red Army does not seem to be reacting at all to the German preparations.

At 3.30 am Moscow time on 6 July 1941, tens of thousands of Soviet guns shatter the silence, announcing to the world that the great 'liberation' campaign of the Red Army has begun. The Red Army's artillery is superior both in quality and quantity to any in the world. There are vast reserves of ammunition stockpiled on the Soviet frontiers. The rate of Soviet artillery fire swiftly increases until it becomes an infernal thunder roaring along the thousands of kilometres of front stretching from the Baltic to the Black Sea. The first artillery salvo coincides to the minute with the arrival of a thousand Soviet aircraft flying across the state frontier. The German airfields have been extremely badly sited right on the border, and the German pilots do not have the time to get their aircraft airborne. There is a great number of aircraft assembled on the German airfields. They are standing wing-tip to wing-tip, and when one burns the fire spreads to the others like a fire in a matchbox.

Black columns of smoke rise above the airfields. These black columns act as beacons for Soviet aircraft, which come on in wave upon wave. Very few planes have been able to take off from the German airfields. German aircrews have been categorically forbidden to open fire on Soviet aircraft, but in spite of the ban imposed by the command, several pilots go into battle, shoot down Soviet aircraft, and when they have used up all their ammunition, they crash head-on into an enemy aircraft in a final suicidal attack. Losses in Soviet

aircraft are enormous, but the advantages of surprise remain. Any army, whether the Soviet, the German, or the Japanese, would have felt no happier under a similar surprise attack.

The artillery preparation grows in power. On the frontier, the Soviet regiments and battalions who have been raised by the alert are given vodka. The thunderous *ura*, the battle-cry of the troops, rolls through the frontier forests. The order of Comrade Stalin, the supreme commander-in-chief, is being read to the troops: 'The hour of reckoning has come! Soviet intelligence has exposed Hitler's perfidy and the time has come to settle accounts with him for all his evil deeds and crimes! Glorious warriors, the world is looking to you and awaits liberation!'

Infringing all established standards and prohibitions, the soldiers are told the numbers of Soviet troops, tanks, artillery, aircraft, and submarines which will take part in the liberation campaign. The rolling *ura* again rumbles out across the wooded glades and forest cuttings. Endless columns of tanks darken the horizon with clouds of dust as they move along roads through field and forest on their way to the frontier. 'Don't spare your fire, you deaf-eared lot!' the tank crews shout through clenched teeth at the deafened artillery troops.

The rumble of artillery fire grows, reaches a critical level, then suddenly stops. Then ringing silence oppresses the ears, and immediately the fields fill with masses of tanks and infantry, the

clank of armour and the fierce hoarse roar of the Soviet troops. The powdery smoke and the poisonous fumes from the tank diesel engines mix with the delicate smell of field flowers, while overhead wave upon wave of Soviet aircraft fly westwards. The artillery, having fallen silent for a minute, restarts, as though unwillingly, its powerful conversation. The artillery goes over from preparation to accompanying support. The batteries have opened up again, concentrating their fire on distant targets. Slowly but inexorably, the firing is stepped up again, and more and more artillery regiments join the battle.

Avoiding becoming involved in protracted battles with scattered enemy groups, the Soviet troops drive forward. The frontier bridges in Brest-Litovsk have been captured by Colonel Starinov's saboteurs. The Soviet saboteurs are astonished that the German bridges have not even been mined. How can one possibly explain such a scandalous degree of unreadiness for war?

The suddenness of the attack has a stunning effect, bringing a whole chain of catastrophes in its wake, each one of which, in its turn, brings on others. The destruction of the air force on the ground renders the

troops vulnerable from the air, and since they have neither trenches nor ditches in the frontier area, they are compelled to withdraw. Withdrawal means that thousands of tons of ammunition and fuel are abandoned at the border. Withdrawal means that airfields are left behind, and the enemy immediately destroys the remaining aircraft there. Withdrawal without ammunition and fuel means inescapable destruction. Withdrawal means that the command has lost control. The command does not know what is happening with the troops and is therefore unable to take any expedient decisions, while the troops are given no orders at all, or they are given orders which are completely out of keeping with the situation which has come about.

At the same time, Soviet saboteurs, who crossed the frontiers with time in hand, are active everywhere on the lines of communication. They either cut the communication lines, or plug into them and transmit false signals and orders to the enemy troops. The enemy's operations become separate, unco-ordinated battles. The German commanders ask Berlin what they should do. It is a serious question, because the Wehrmacht has not prepared itself for defence. What do we do? Advance? Operate in accordance with the pre-war Barbarossa plan? Without an air force? Without air supremacy?

The 3rd Soviet Army delivers a surprise strike at Suwalki. The 8th Army from the Baltic Military District goes to meet it. From the very beginning there are blood-letting engagements with great losses in Soviet troops. But they have one advantage: the Soviet troops have the latest KV tank, the armour of which the German anti-tank guns cannot penetrate. The Soviet Air Force rages overhead. The 5th Airborne Assault Corps has landed behind the German forces. The Soviet 8th, 9th, and 3rd Armies have become bogged down in long drawn-out bloody battles with the extra-high-power German forces in East Prussia, but behind this titanic battle, the extra-high-power Soviet 10th Army, having broken through the almost nonexistent defences, drives on to the Baltic Sea, thereby cutting off three German armies, two tank groups and Hitler's command post from the rest of the German troops.

From near L'vov, the most powerful Soviet front launches an attack on Cracow and a secondary attack on Lublin. The right flank of the extra-high-power Soviet grouping is covered by hills. On the left flank, a great battle flares up in which the Red Army loses thousands of tanks, aircraft and guns, and hundreds of thousands of soldiers. Under cover of this battle, two Soviet mountain armies, the 12th and the 18th, launch attacks along the mountain ridges, thereby cutting off Germany from its sources of oil. Soviet airborne assault

corps have landed in the hills. They capture and hold the passes, and prevent reserves being transferred to Romania.

The main events of the war are not taking place in either Poland or Germany. In the first hour of war, operating along with the air arm of the 9th Army and the Black Sea Fleet, the 4th Soviet Air Corps delivers a heavy shock strike at the Ploesti oilfields, turning them into a sea of fire. Bombing raids on Ploesti continue round the clock. The glow from the oil fires is visible at night for many kilometres, while by day columns of black smoke hide the *horizon*. The 3rd Airborne Assault Corps has landed in the hills to the north of Ploesti. Operating in small elusive groups, it is destroying everything connected with the production, transportation and the refining of oil. Lieutenant-General Batov's 9th Special Rifle Corps has landed in the port of Constanza and to the south of it. Its objectives are the same: pipelines, oil storage tanks, and refineries. The most powerful of all Soviet armies, the 9th, has burst out onto the Romanian plains.

The Soviet 10th Army has not been able to break out to the Baltic Sea. It has suffered fearful losses. The Soviet 3rd and 8th Armies have been completely wiped out and their heavy KV tanks destroyed by German anti-aircraft guns. The Soviet 5th, 6th and 26th Armies have lost hundreds of thousands of soldiers, having been stopped on the approaches to Cracow and Lublin. At this moment, the Soviet High Command throws the Second Strategic Echelon into the battle. The difference is that the Wehrmacht has only one echelon and insignificant reserves, while the Red Army had two strategic echelons and three N K V D armies behind them. In addition, mobilization was declared in the Soviet Union as soon as the war began. This had given the Soviet High Command five million reservists in the first week of the war. These will replace Soviet losses, and over the months which follow will be formed into more than three hundred new divisions who will enable the war to continue.

Five Soviet airborne assault corps are completely destroyed, but their headquarters and rear sub-units remain on Soviet territory. These immediately take in tens of thousands of reservists to make up their losses, and in addition to this, five new airborne assault corps are formed. Both Soviet tank troops and air force suffer enormous losses in the initial battles, but Soviet war industry is not destroyed by the enemy air force, nor does it fall into enemy hands. The biggest tank-producing plants in the world, in Khar'kov, Stalingrad, and Leningrad do not stop their production of tanks, but considerably increase it. But even that is not the most important thing.

The German Army still has tanks, but no fuel for them. The infantry still has armoured personnel carriers, and the artillery still has tractors, but no petrol for them. There are still aircraft, but no fuel for them. Germany has a powerful naval fleet, but it is not in the Baltic. Even if it were to appear there, there would be no fuel for active operations. The German Army has thousands of wounded who have to be evacuated to the rear. There are ambulances, but no fuel for them. The German Army has a great number of motor vehicles and motorcycles for moving troops about, to keep them supplied, and for reconnaissance, but there is no fuel for them either.

The fuel is in Romania, which has proved impossible to defend by the usual methods. Stalin knew this, and so did Zhukov. Hitler also knew this all too well.

In August 1941, the Second Strategic Echelon completes the Vistula-Oder operation by capturing bridges and springboards on the Oder. A new operation in great depth is begun from here. The troops cross the Oder in a continuous stream of artillery, tanks and infantry. There are heaps of caterpillar tracks, covered by a light film of rust, lying at the roadsides; as soon as they join German roads, the high-speed tanks discard their tracks and forge swiftly ahead.

The troops meet endless columns of prisoners. Dust rises on the horizon. There they are, the oppressors of the people -shopkeepers, bourgeois doctors and architects, farmers and bank employees. The Chekists' work will be hard. Prisoners are cursorily interrogated at every stopping place. Then the NK VD investigates each one in detail, and establishes the degree of his guilt before the working people. But by now it has become necessary to expose the most dangerous of the millions of prisoners: the former Social Democrats, pacifists, socialists and National Socialists, former officers, policemen and ministers of religion.

Millions of prisoners have to be sent far away to the east and the north, in order to give them the opportunity, through honest labour, to expiate their guilt before the people. But the railways are not conveying prisoners. The railways are working for victory. The railways are carrying thousands of military trains laden with ammunition, fuel and reinforcements.

Where are the prisoners to go? The 4th Mechanized Corps has captured a concentration camp near Auschwitz. It was reported to higher authority, and permission was awaited to use it for its intended purpose.

Permission was refused; it was ordered that a museum be made of Auschwitz. New concentration camps must be built nearby.

More and more columns move westwards. The commissars take a few men from each of the passing columns, and take them to Auschwitz and show them around saying, 'Take a good look, and then go back and tell your comrades.'

The soldiers are then driven back to their battalions in political department cars, and they talk.

'Well, what was it like in Auschwitz, pal?'

'Nothing much, really.' The worldly-wise soldier in his black jacket shrugs his shoulders. 'Just like at home. Only their climate is better.'

The battalion drinks raw vodka before going into battle. The news is good. There's permission to take trophies, there's permission to pillage. The commissar is shouting. He has become hoarse. He's quoting Ilya Erenburg - let's break the pride of the arrogant German people!

The black jackets laugh. How shall we break their pride, with mass rape?

So none of this happened? Indeed it did happen - not in 1941, it is true, but in 1945. Then the Soviet soldier was permitted to plunder, though the term used for it was 'collecting trophies'. And they were also ordered to 'break German pride'. Millions of people fell into the clutches of the Soviet secret police. And they were driven off in endless columns to distant places. Not everyone returned.

There are few who remember that the slogan about liberating Europe and the whole world first rang out, not in 1945, but at the end of 1938. As he was completing the Great Purge in the Soviet Union, Stalin rewrote the entire history of communism and set it new goals in his book *History of the CPS U(b): A Short Course*. This became the principal handbook for all Soviet communists and all communists throughout the world. It concludes with a chapter on how the Soviet Union is encircled by capitalism. Stalin set the great goal, which

was to replace capitalist encirclement with socialist encirclement. The fight against capitalist encirclement had to go on until the last country in the world had become a 'republic' forming part of the Soviet Union.

'The USSR in capitalist encirclement' became the main subject of political studies in the Red Army. Propagandists, commissars, political workers, and commanders all united to lead every soldier in the Red Army to Stalin's simple and logical answers to problems. And over the iron battalions of the Red Army there thundered forth the song about the war of liberation which would begin on the order from Stalin:

With spitting fire and gleaming steel now flashing
Machines set forth, their fierce crusade alight,
When Comrade Stalin sends us into battle,
And our First Marshal leads us in the fight.

This is how a Soviet air general described the future war in *Pravda*:

What joy and happiness will shine in the faces of those who will receive here in the Great Kremlin Palace the *last* republic into the brotherhood of nations of the whole world! I envisage clearly the bomber planes destroying the enemy's factories, railway junctions, bridges, depots and positions; low-flying assault aircraft attacking columns of troops and artillery positions with a hail of gunfire; and assault landing ships putting their divisions ashore in the heart of the enemy's dispositions. The powerful and formidable air force of the Land of the Soviets, along with the infantry and tank and artillery troops will do their sacred duty and will help the enslaved peoples to escape from their executioners. (*Pravda*, Georgi Baidukov, 18 August 1940)

It is characteristic that, in the course of his lengthy article on the forthcoming war, the air general did not once call the war 'defensive', just as he did not once mention fighter aircraft which fight battles in the air. As

far as the general was concerned, only bomber planes, low-flying assault aircraft and assault landing aircraft would be needed in the war of 'liberation'.

Enough statements like this were published to fill many volumes. Wanda Vasilevskaya, the Polish communist who was given the rank of colonel-commissar in the Red Army, proclaimed in the pages of *Pravda* (9 November 1940) that not for long would the butchers go on drinking blood, not for long need the slaves go on rattling their chains - we'll liberate them all!

The Soviet communists declared their main objective quite openly - to liberate the whole world, and Europe first of all. This plan was actively pursued; in the course of 1940 alone, while Germany was fighting in the west, five new 'republics' were annexed into the Soviet Union. After this, it was openly declared that 'liberation' campaigns would continue, and enormous forces were created for this purpose. The next victim of 'liberation' could only have been Germany, or Romania; for Germany this would have meant immediate defeat.

Preface

Hitler had a red flag. And Stalin had a red flag. Hitler ruled in the name of the workers' class, his party was called the workers' party. Stalin also ruled in the name of the workers' class; his power system officially bore the title of "dictatorship of the proletariat." Hitler hated democracy and struggled against it. Stalin hated democracy and struggled against it. Hitler was building socialism. And Stalin was building socialism. Under the title of socialism Hitler saw a classless society. And Stalin, under the title of socialism, saw a classless society. In the midst of the classless society built by Hitler, and in that built by Stalin, flourished slavery in the truest sense of the word.

Hitler held his road to socialism as the only correct one, and viewed all other paths as distortions. Stalin also held his road to socialism uniquely correct, and saw all other paths as diversions from the principal line. Hitler mercilessly destroyed all his party comrades, such as Roehm and his followers, when they strayed from the correct path. Stalin also mercilessly destroyed all who strayed from the correct path. Hitler had a Four Year Plan. Stalin had Five Year Plans.

In Hitler's Germany, one party was in power, the others in jail. And in Stalin's Soviet Union, one party was in power, the others in jail. Hitler's party stood above the nation, and its leaders ruled the country. Stalin's party also stood above the nation, and its leaders ruled the country.

The most important holidays in Stalin's empire were May 1 and November 7–8. In Hitler's empire, they were May 1 and November 8–9.

Hitler had the *Hitler Jugend*, young Hitlerists. Stalin had the *Comsomol*, young Stalinists.

Stalin's official title was Fuehrer; Hitler's was leader. Pardon, Stalin's was leader and Hitler's Fuehrer. In translation, they are identical. Stalin declared that Russians were responsible for all outstanding scientific and technological advances: the hot-air balloon, locomotive, airplane, radio, etc. Hitler claimed the same for Germans.

Hitler loved grandiose structures. He laid in Berlin the foundation to the largest building in the world—the House of Assembly. Its dome spanned 250 meters in diameter, by

some counts. The main hall was to have the capacity to hold 150,000 people. Stalin also loved grandiose structures. He laid in Moscow the foundation for the largest building in the world—the Palace of Soviets. Stalin’s main hall was smaller than Hitler’s, but the entire edifice was much higher. The 400-meter-high building resembled a pedestal for the 100-meter-tall statue of Lenin.

Hitler planned to tear down Berlin, and in its place to raise a new city of monstrous structures. Stalin planned to tear down Moscow, and in its place to raise a new city of monstrous structures.

In Germany, Hitler was an outsider. He was born in Austria, and did not have German citizenship almost until the moment he came into power. For Russia, Stalin was an outsider. He was neither Russian, nor even a Slav. He was born in Georgia.

Sometimes, on rare occasions, Stalin invited foreign visitors to his Kremlin apartment. They were shocked by the modesty of the interiors: a plain table, a closet, an iron-post bed, a soldier’s bedcover. Hitler ordered the press to run a photograph of his living quarters. The world was shocked by his modesty: a plain table, a closet, an iron-post bed, a soldier’s bedcover. Nevertheless, in secluded areas in the midst of magical natural surroundings, Stalin created quite cozy and well-protected residential fortresses, which did not at all resemble an ascetic’s cell. Hitler also built impenetrable residence-fortresses in secluded areas in the midst of natural wonders, without frugality in his use of granite and marble.

Hitler’s mother dreamed that her son would become a priest. Stalin’s mother had the same dream for her son.

Hitler’s beloved, Geli Raubal, was more than twenty years his junior. Stalin’s beloved, Nadezhda Alliluieva, was more than twenty years his junior. Geli Raubal committed suicide, as did Nadezhda Alliluieva. The circumstances of Raubal’s death remain unclear. A theory proposes that Hitler murdered her. The circumstances of Alliluieva’s death are mysterious. A theory proposes that Stalin murdered her. The means of suicide (murder) for Geli Raubal was a handgun. It was Hitler’s personal handgun. The means of suicide (murder) for Nadezhda Alliluieva was a handgun. It was Stalin’s personal handgun.

Hitler said one thing, and did another. So did Stalin. Hitler began his rule under the slogan “Germany Wants Peace.” He proceeded to occupy half of Europe. Stalin fought for the “collective security of Europe,” without holding back any strength or means. Afterwards, he proceeded to occupy half of Europe.

Hitler had the Gestapo. Stalin had the *Narodnyi Kommissariat Vnutrennikh Del* (NKVD)—the People’s Commissariat of Internal Affairs. Hitler had Auschwitz, Buchenwald, and Dachau. Stalin had the *Glavnoe Upravlenie Lagerei* (GULAG)—the Main Prison Camp Directorate.¹

Hitler had Babyi Yar. Stalin had Katyn. Hitler massacred people by the millions. Stalin also killed people by the millions.

Hitler did not decorate himself with medals of honor, and neither did Stalin. Hitler wore a semi-military uniform without any signs of distinction, and Stalin wore a semi-military uniform without signs of distinction. Some might argue that later on Stalin acquired a taste for military titles, marshal batons, and gilded epaulettes. This is true, but Stalin only named himself Marshal in 1943 after the Stalingrad victory, when it finally became clear that Hitler would lose the war. At the time of receiving this title, Stalin was sixty-three years old. He wore the Marshal’s uniform for the first time for the Tehran Conference, while meeting

with Churchill and Roosevelt. We cannot in this respect compare Hitler and Stalin simply because Hitler did not live to a comparable age, to see comparable meetings, or comparable victories.

In all other respects, the comparison fits. Stalin did not wear a beard, but had a famous mustache. Hitler had no beard, but a famous mustache. Where does the difference lie? The difference lies in the shapes of the mustaches.

The difference also lies in the fact that Hitler's actions were seen by the world as the greatest of crimes, while Stalin's actions were considered by the world as a struggle for peace and progress.

The world hated Hitler, and commiserated with Stalin. Hitler conquered half of Europe, and the rest of the world declared war against him. Stalin conquered half of Europe, and the world sent him greetings. To ensure that Hitler could not hold on to the conquered European countries, the West sank German ships, bombed German cities, and then landed a massive and powerful army on the European continent. To enable Stalin to conquer and hold on to the other half of Europe, the West gave Stalin hundreds of warships, thousands of war planes and tanks, hundreds of thousands of the world's best war vehicles, and millions of tons of its best fuel, ammunition, and supplies.

This book is about Stalin's aggressive endeavors, about his role in plotting World War II—the bloodiest slaughter in human history. Perhaps one might become suspicious: in exposing Stalin, am I attempting to exonerate Hitler? No, I am not. For me, Hitler remains a heinous criminal. But if Hitler was a criminal it does not at all follow that Stalin was his innocent victim, as Communist propaganda portrayed him before the world.

Acknowledgments

I have planned to write this book since I discovered that the Soviet version of the history of World War II was a lie and concealed the USSR's responsibility for planning the start of the war. The primary reason for my decision to defect to the West in 1978 was to make my discoveries available to the Russian people and the world public. Since then I have been able to publish several books on military topics. All of them received wide acclaim in the West, but that was not the case with the book of my lifework—*The Icebreaker*, published in English in Great Britain in 1990. It quickly sold out, but for reasons never explained to me, the publisher refused to print further editions.

It quickly became apparent that the Western academic community was as reluctant as the Communist propaganda apparatus to accept my new interpretation of the cause of World War II. Instead of confronting my arguments the way the Soviets did, my Western opponents chose a different kind of confrontation—silence.

Meanwhile, communism and the Soviet Union collapsed. In 1990 *The Icebreaker* was published in Russian in Moscow and produced a firestorm. The first edition of *The Icebreaker* totaled 320,000 copies; the second, 1,000,000. Hundreds of thousands of copies of my other books on the same topic, including *The Day M*, *The Last Republic*, *The Purification*, and *The Suicide*, quickly sold out. Two television documentaries based on *The Icebreaker* were produced in Russia. Dozens of Russian historians rushed to explore the new horizons opened by my book. Some of them argued and disagreed with my interpretations of specific episodes or details; others raised new questions and suggested new theories.

A similar response to my book was aroused in former Communist countries. In Poland I became a celebrity overnight. Baltic countries incorporated my findings into their official history and textbooks. More important was the flood of letters I began to receive from 1990 from all over the world, but mostly from the former Soviet Union. People provided me with their unique insights and sent me copies of documents in support of my theory. Many of these details, as well as evidence from newly published materials, are incorporated in *The Chief Culprit*.

However, after encountering a virtual academic boycott in the West, I gave up trying to publish my books in the West. In 1999 I received an inquiry from a man who introduced himself as Alexei Sobchenko, an American of Russian origin, about the English-language version of *The Icebreaker*. I curtly replied that there was no interest in the West for this book. Besides, I was too busy to waste time pursuing an unrealistic goal. “Well, probably, you should write another book, since *The Icebreaker* was written for Russian readers, and hardly can be understood by people who did not live in the Soviet Communist society,” replied Sobchenko. “Besides, you wrote four more books after *The Icebreaker* and it would be a good opportunity to update and summarize them, and add your new discoveries.”

Alexei was introduced to Jerry and Leona Schecter, who found my ideas challenging, and Leona agreed to become my literary agent for this book. Eventually they became my friends and did much more for this book than a literary agent’s job requires. I would also like to thank Dr. Albert Weeks for his longtime support and efforts on my behalf.

Maria Samorodina-Erb, who at the time was a student at the University of Pennsylvania, volunteered to translate the book into English. Russian Americans Vlad Barash, Leonid Avrashov, and Olga Cherny helped to translate additional chapters. Serghei Kharlamov—a Moscow-based historian, checked the text for factual accuracy. Yuri Felshtinsky, a historian from Boston, worked to tailor the text for Western readers. Misha Shauli, from Israel, skillfully applied his wide knowledge of World War II history to correcting, editing, and retranslating the text as it evolved. Actually, Misha’s role in this book was so crucial that, unwillingly, he ended up becoming my editor for *The Chief Culprit*. Copy editor Jehanne Moharram’s diligence and concern improved the final editing and proofreading. Nothing, neither the first Russian-language version of *The Icebreaker* nor this new book, would have been possible without the assistance of my devoted wife Tatiana.

I often doubted that this book would be published. It never would have been possible without the dedication of those I have mentioned and those who must remain anonymous, for their safety, who sent me new corroborating archival materials and relevant personal details. Richard Russell, director of the Naval Institute Press, has been instrumental in bringing *The Chief Culprit* to print, and to him and his dedicated colleagues I am deeply grateful. Happily, he proved me wrong in thinking its publication would never happen in the West.

Introduction

Solving puzzles is not for everyone, but for me it is a passion. I feel that I am truly blessed, for fitting pieces together is my job. It is strenuous work that mobilizes your patience and attention; but the benefits are great. You switch off the world of turmoil, you forget about your concerns, debts, and ailments. Hated faces of enemies and opponents dissolve into darkness. Your heart starts beating calmly and steadily. Your brain is cleansed of evil plots, and your soul freed of dirt and soot. No, I am not an archaeologist who, out of clay pieces, assembles an ancient Egyptian pot, and from glass fragments, a precious Roman vase. Neither am I an anthropologist, who out of tiny splinters of bone assembles the skeleton of a mammoth hunter. I am a spy. An intelligence operative of a rare breed, an analyst from the Main Intelligence Directorate of the General Staff of the Soviet Armed Forces (GRU).¹

For some, intelligence work is violent: kidnapping and killing, or breaking into safes to steal secrets. For others, like myself, it is an office stuffed with books and thick folders piled high to the ceiling with papers that can never be straightened out. It is a green table lamp and a pot of coffee. The puzzles I had to work on were so huge they encompassed more than a hundred thousand pieces. Can you imagine the challenge? Nobody, including me, knew how many puzzles there were in the pile—one, two, or three? All I knew for sure was that some pieces were missing and could never be found. Which pieces belonged to which puzzle? Which ones were complete strays? Then came the most important task—to fill in the blanks. It is essentially the same as restoring a gigantic dinosaur from a fragment of a bone, or predicting the existence of a planet in the darkness of space based on gravitational anomalies. Archaeologists or astronomers can easily be compared to the people who process intelligence information. The difference is that intelligence achievements rarely come out in the open.

You might wonder, how does one become an intelligence operative? I started early. I was eleven years old when I joined the Soviet Army. Seven years of the “Military Boarding School” was a tough school of life. Not everyone who trained there became an intelligence analyst. They taught us situation analysis. They gave us pieces of a puzzle: one, two, three pieces. What did they mean? The answer had to come immediately. For example: the opponent has a tank company here, an artillery battalion there, a bridge here, and there is an ammo dump on the premises. What does he intend to do? What do we have to do if we are

stronger at the moment? What if we are weaker? After graduation some of us were chosen for the Frunze High Command Army School in Kiev. That school was training intelligence operatives. Instead of four years it took me three and I graduated with honors.

I started my service duty as an officer in the Carpathian military district. Soon I was transferred to the Volga Military District whose headquarters were in Kuibyshev, the unofficial capital of the Soviet Union that was created when Moscow was threatened by the German invasion in 1941. Stalin and the most important government organizations were in Moscow, but the larger part of the government ministries and all of the foreign embassies and missions were in Kuibyshev. In case of a crisis Stalin was supposed to relocate there. This “spare” capital of the Soviet Union continued to function in the time of peace. All the political, economic, and military data on the United States of America and other countries was processed in Moscow. Simultaneously and independently of Moscow that same data was analyzed in Kuibyshev. That is what I was doing there at the command post.

They had taught us at the Academy to trust no one, to question every fact, to verify every piece of data, to doubt everything. If a hundred secret agents are reporting one way, and one sounds out of place and makes no sense, deal with him. No one will trust him or you, they will laugh at you, and they will not believe you. But this is how great discoveries are made. It is easy to repeat known facts. It is much more difficult to find something that nobody knows. And if you find it, you will be misunderstood and contradicted a lot at first. Then you find proof for it and convince your superiors. I did exactly that, and I was noticed. They sent me to the topmost secret military academy in the Soviet Union. It was called the Soviet Army Academy. It was so secret that no one ever mentioned it in public. It took me three years to complete the course of study there. The curriculum was so intense that it could take fifteen years to complete, but it was compressed for a reason: it was a test. Those who could not handle the stress would not be able to handle intelligence work. The tempo was inhuman. You were flooded with thousands of messages simultaneously: pieces of secret telegrams, secret agents’ reports, images from space, photos from passing cars, fragments of taped conversations, wrinkled and dirty topographic maps found at the site of recent maneuvers. All that raw material had to be sorted, analyzed, and evaluated. Everybody knew those who excelled would get the most interesting assignments.

After graduation I was sent to Geneva, the world capital of espionage. My first job was attaché of the USSR Permanent Mission to the United Nations in Geneva. That was my official title, but in reality I spent four years processing intelligence information.

At school they had taught me to ask, “Why?” They had taught me to look for reasons and the internal logic for everything. I believe my instructors overdid it because I started asking too many questions. Why could the Soviet Union launch the first satellite into space, and send up the first dog and human beings, but could not raise enough wheat to feed its own people? Why is America our enemy? Why doesn’t the United States like us? What if it is us who do not like them? Why? What do we need Africa for? What are our interests in Vietnam, Cuba, and Chile? Don’t we have enough land of our own? Have we resolved our own problems at home, and if not why are we trying to teach everybody else?

The head of my country told Americans: “We will bury you!” That was the essence of the Soviet Union’s foreign policy at the time. We were digging a grave for the United States and all the other countries of the world. Our foreign policy was the top priority. We had more nuclear submarines than all of the countries of the world combined. We also had more air-

borne divisions, tanks, and field artillery. We filled the world with Kalashnikovs. At the same time we could not feed ourselves. So here was the question: Why should we bury America? Are they in our way? If we bury the United States, who is going to feed us?

I became more and more bewildered as I tried to answer my own questions. I had been taught to notice strange occurrences, anomalies, exceptions to the rules. One strange thing that I noticed: No matter what happened in the Soviet Union our leaders always tried to conceal the negative aspects and show the positive. There were no private enterprises in the Soviet Union back then. All the media—and everything else, for that matter—belonged to the government. Our newspapers reported only what was advantageous to the government. For example, the media reported that crime was almost nonexistent and steadily declining. They wrote that everything was fine, culture was flourishing, the quality of life was getting better and better, we would soon surpass the United States. You could not find any negative news.

On the night of October 6, 1948, the city of Ashkhabad was leveled by an earthquake reported to have reached magnitude 10 on the Richter scale, the maximum strength. The epicenter was only twenty kilometers away from downtown. The disaster struck in the middle of the night when all of the people were asleep. The whole city collapsed instantaneously. The only building left standing was the city prison. Everything else turned into broken brick and stone rubble; 110,000 people died under the debris. The facts of this disaster became public only thirty years later. Back in 1948 not a single Soviet newspaper or radio station reported it. Not one government official commented on it. Furthermore, those who spoke about the earthquake were arrested and put in prison for “spreading false rumors.” You would ask yourself, why conceal an earthquake? That was the way the Soviet system worked: we are so good that we do not even have earthquakes!

On the same premise no media outlet or official in the Soviet Union mentioned the Chernobyl disaster when it occurred. The Swedes were the first to sound the alarm. The wind had blown the radioactive cloud from the Ukraine through Belarus, Lithuania, Latvia, Poland, and across the Baltic Sea to Sweden where the emergency warning equipment went off at a local nuclear power station. Swedish engineers could not figure out why their equipment was going off; they were looking for problems at their own station. It took them awhile to figure out that the radiation was in the air, carried by the wind from afar. After the international investigation had started the Soviet government admitted that there had been a small accident at the nuclear plant in Chernobyl. Even then the Soviets claimed that the accident was completely insignificant and no one should pay any attention to it.

There were other terrible catastrophes at the Soviet nuclear power stations and nuclear sites prior to Chernobyl, but they were kept under wraps. Soviet television shows relished tragedies elsewhere but nothing was said about our own. On October 24, 1960, the Chief Commander of the Strategic Rocket Forces, Chief Artillery Marshal M. I. Nedelin, was killed as a result of a rocket explosion. His death could not be concealed. The Soviet command announced it, but did not reveal how many people perished with him. Even now, eighteen years after Marshal Nedelin’s death, the *Soviet Military Encyclopedia*² does not specify where or how he died. The encyclopedia lists dates and places of birth and death for everyone but him.

Modern Russia inherited the tradition of hiding everything negative. When the nuclear submarine *Kursk* sank it was not possible to hush that up. The Russian authorities announced that the submarine was submerged, that communication with the crew was established, there

were no victims, and there was a hose pumping air into the vessel. For a week, the Russian government told tall tales about how everything at *Kursk* was going just fine. Later it turned out that there had been no communication with the people on board the *Kursk*, and nobody had pumped air in to them.

I gave you all of those examples to show that these are our traditions and rules. But there is an exception to these rules: June 22, 1941, the day when Germany attacked the Soviet Union. This day is described by Communist propaganda in truly dark colors. Thousands of books, tens of thousands of articles, and radio and TV broadcasts told about the blatant unpreparedness of the Red Army for military action. All of those sources paint a picture of stupid, cowardly Stalin who trusted Hitler. They tell us that after the Germans attacked, Stalin was so scared that he went into hiding and would not show himself. They talk about the army that had no good commanders, about outdated tanks and airplanes that were called “flying coffins,” about the terrible ineptitude of the Soviet military leaders, about the absence of war planning.

Hundreds of Western historians fell for those stories: if the Russians themselves were talking about their own stupidity, why not repeat it? Everyone is happy to laugh at someone else’s stupidity. As a result the whole world is laughing. I was taught to look for incoherence. There it was, gaping right at me. Why could we not talk about an earthquake, but could speak about bad tanks? Why was it that the Soviets, who thoroughly hid any mistakes, accidents, or catastrophes, made such a tremendous effort to emphasize the mistakes of 1941? Why did we expose the negative developments of 1941, while hiding data about a bad harvest? I took a closer look at the way our history was written and found something even more curious. In 1942 the Red Army suffered a number of monstrous defeats: in the Crimea, near Kharkov, Leningrad, and Rzhev. Our textbooks did not mention those. It struck me as strange that it was acceptable to talk about the defeats of 1941, but not about the defeats of 1942.

Let us look further. In July, August, September, and October of 1941 the Red Army suffered crushing defeats near Smolensk, Kiev, Uman, and Viazma. Our history books did not and still do not mention those either. What could that mean? When, where, and under what kind of circumstances would a person or a nation passionately try to prove that they are stupid and unfit for a fight? I found one example. Imagine a murderer in court trying to convince the jurors that he is not guilty of the crime because he is mentally challenged, completely blind and therefore cannot shoot, and too weak to raise an ax. In addition he says that he has no bullets to shoot, his gun is broken, and his ax is rusty. There is no reason anyone would deem themselves stupid, powerless, and unfit to do anything other than to get out of a situation where they can be accused of a crime.

That is exactly the way Communist propaganda behaved while describing the events of June 1941. Communist historians and propaganda masters went out of their way to hide any details that would enable an outsider to restore the reality of what was happening at the time. They would only show their stupidity and incapacity to the world. For example, Soviet textbooks did not give information about the number of tanks that the Red Army had at that time. The texts just said that the tanks were badly suited for battle. The books did not say anything about the number of planes. They just stated that the planes were outdated. I decided to compose the picture myself, to re-create that reality. I had to find all the shards, all the fragments, all the pieces that were scattered all over. I decided to start from the top. How many field armies were there in the Soviet Union in 1941? I looked through many books on

the subject but could not find the answer. Then I started to collect information about every field army individually in order to put the pieces together later. The results were amazing.

In June 1939, when Hitler was the enemy and his name was used to scare children and adults alike, the Soviet Union had two field armies. Neither of them was deployed in the European part of the Soviet Union. In August 1939 Stalin and Hitler, represented by Molotov and Ribbentrop, signed the non-aggression pact. We were told that Stalin decided to believe Hitler. I trusted that information, but here are some statistics: In June 1941 the Soviet Union had thirty-one field armies. Twenty-six of them were deployed in the European part of the country. This surprised me. While Hitler was considered an enemy we did not possess any armies against him, but as soon as the pact between Stalin and Hitler was signed, Stalin increased the number of Soviet armies from zero to twenty-six in a period slightly less than two years. How does that fit with stories of Stalin trusting Hitler?

A corps is the next level within an army. How many of those did we have? The answer is hidden. There are thousands of books about the war, but nobody ever talks about how many corps there were within the Red Army in June 1941. I collected all the data. When I put it together the results were, again, astounding.

How many divisions were there? And most importantly where were they positioned?

If you were analyzing a chess match you would want to know not only the number of pieces on the board but their positions too. The problem was that although there were mountains of books about the war written in the Soviet Union, none of them had a map demonstrating the deployment of the Soviet Forces. In a famous book by Marshal Zhukov, all the maps are colored. The only map that shows the deployment of the armed forces at the moment of Hitler's attack is black and white. It is also very small and shows the span from the Baltic Sea to the Black Sea in six centimeters, less than two and a half inches. You could cover the whole theater of war between the Soviet Union and Germany with the palm of a child's hand. The map says that the 3rd, 4th, and 10th armies were deployed on the German border. It also states that there were other armies. But only nine of the twenty-six are named. The rest are omitted. Most important is that the deployment of the armies is not shown on the map. It is completely unclear where they really were. How can you analyze the beginning of a war if you do not know the number of the armed forces and their positions? I was determined to solve the puzzle. But how does one go about it?

I found a way. I was a student at the Academy at the time. Our professors urged us all to conduct independent scientific research in order to figure out who would make the best intelligence analysts. I took advantage of the situation and chose "The Attack of Germany on the Soviet Union on June 22, 1941" as the title of my paper. I explained my interest in the subject easily. I said that it was a horrible tragedy and I wanted to study how Germany prepared for the attack, in order to make sure that nothing of the kind would ever happen again.

The topic of my research was approved and I was given access to closed archives. The most important things that I needed were the archives of the German army. The Red Army had captured them at the end of the war, transferred them from Berlin to Moscow, and placed them under lock and key. Almost nobody has access to these archives. I was bewildered: If Hitler was the aggressor, why not open the archives for all to see?

There could be only one answer: there was something in those archives that the Soviet leadership did not want to admit. There is an incredible number of German documents in

the archives in Podolsk, a small town near Moscow. There are piles and piles of boxes, most packed right after the end of World War II and never opened.

I had to be extra careful not to show my real interest. I asked the archive workers to assist me in my search to find maps of the deployment of the German troops. We found those, but I was looking for something else too and I finally found it. One of the maps showed the deployment of all the German troops just before the invasion. It also showed the positions of all the Red Army divisions the way German military intelligence pictured them just before the beginning of the war. That was exactly what I needed. I made a copy of it and all the other maps.

The map of the German troop deployment gave me quite a shock. The position of the divisions of the Red Army mirrored the position of the German Army. The border between the Soviet Union and Germany went through the territory of Poland which Stalin and Hitler had divided between them. The border was wavy. There was a big foreland of Soviet territory jutting into the German territory, like a Communist cape in the Nazi ocean. Then there was a big foreland of German territory that heavily indented the Soviet land. After that one could see a Soviet landmass going deep into the German territory again, and a German cape in the Soviet territory. The border took the form of two notched wheels. The red notches were cutting into Hitler's brown wheel, and the brown notches were cutting into Stalin's red wheel.

The Soviet forces were concentrated in those two masses of land, two capes that were indenting the German territory. The German divisions, tanks, artillery, and airfields were situated right in front, on the left and on the right of the Soviet troops. Even in peace time, Soviet divisions, corps, and armies were almost encircled by German troops. From a defensive point of view such deployment of the Soviet troops was useless and stupid. The only thing Hitler had to do was to attack the troops at the base of those promontories and the best units of the Red Army would be trapped. The German divisions were also situated in the promontories reaching far into the Soviet territory. They also were almost encircled by Soviet troops in peacetime. Stalin could close the mousetrap just as easily. From the defense point of view this kind of deployment of the German troops was pure suicide. I can only say that the Germans were not preparing for defense. They were getting ready for a sudden strike. For a sudden attack this position was very beneficial.

The Red Army was also preparing for a sudden attack. If you look at the position of the Soviet divisions from the point of view of an offensive, you could not imagine a better deployment. The airfields of the Red Army were moved all the way up to the border. Communist propaganda masters laugh at that. They say: "Look how stupid the Soviet generals were, they situated the airfields in such a fashion that they fell to the enemy in the first hours of the war."

The German airfields were also situated almost on the border itself. Why is it that nobody laughs at them? This way of positioning the troops and logistical forces does not make sense from a defensive point of view. If you look at it from the point of view of offense it makes total sense.

There was no difference between the actions of Stalin and those of Hitler. Hitler just happened to strike first. If Stalin had been the one to attack first, all the advantages of the deployment of the German troops would have turned into disadvantages.

In order to understand what happened I will begin the story from 1917 when the Communists took power in Russia, instead of 1941, when Hitler attacked Stalin.

It is legitimate to wonder if German intelligence made a mistake. What if the Germans were wrong in assessing the situation in the summer of 1941? I had to find an answer to that, and I did. German intelligence saw the situation correctly, but it did not see all of it. The real picture was much graver. The concentration of Soviet troops on the German border was frightful. Anyone can see it for themselves. All you would have to do is open the memoirs of the Soviet generals and put all the data about Soviet divisions, corps, and armies into a computer. Every Soviet general describes his division or corps but also speaks about his neighbors, about superior units, and about subordinates. It takes years to put it all together, but anyone who does that will be convinced that all the data confirm what I said earlier, and the general picture is terrifying.

The following simple fact can serve as additional proof of the aggressive ambition of the Red Army. More than sixty years have passed since the Germans attacked the Soviet Union, but neither the government of modern Russia nor the General Staff ever made public any maps that would demonstrate the deployment of all Soviet divisions on June 21, 1941. All that information remains a state secret. The highest level of secrecy in the Soviet Union is a document labeled “Top Secret: Special Folder.” At present the Kremlin archives contain 215,000 “Special Folders.” Nobody has access to them. In addition, there are hundreds of thousands of documents labeled “Secret,” “Top Secret,” and “Top Secret: Of Special Importance.”

Sometimes the Kremlin rulers try to show their liberalism and good will. A small number of those secrets come out in the open. They are always heinous secrets. For example, the cooperation agreement between the People’s Commissariat for Internal Affairs (NKVD) and the Gestapo became public knowledge. It was signed on November 11, 1938. Beria and Muller signed that document. What areas of cooperation could there be between two of the bloodiest organizations in the world’s history? The answer is the following: in their main specialty—suppressing freedom and engaging in the mass elimination of people.

Another document that surfaced recently speaks about secret contacts between Stalin and Hitler. It is dated February 19, 1942. Stalin was an ally to Franklin D. Roosevelt and Winston Churchill. He was trying to strike an agreement with Hitler behind their backs. When papers like these become available to the public one should remember that they are just a drop in a bucket. Those documents are the ones the authorities are not ashamed to show. All the documents that are not accessible to researchers contain secrets that are much scarier and dirtier.

I am not a historian but I believe that there are a lot of similarities between history and intelligence. Both a historian and an intelligence officer have to look for things that nobody knows about. The difference is that a historian would treat the Soviet Union as a regular country, just like any other. That is why he would use traditional methods of historical science. I consider the Soviet Union a criminal conglomerate. The Soviet leaders have committed uncountable acts of atrocity against their own people and against neighboring nations. That is why for me the history of the Soviet Union should be studied using methods of criminology and intelligence rather than classical scientific research. Vladimir Bukovsky was correct in noticing that Western politicians and diplomats just cannot understand the motives of the Soviet leaders. If a policeman from Manhattan were to try to deal with them he would have made sense of their behavior immediately. A policeman would have understood and would have been able to predict all of the moves and actions of the Kremlin rulers. I

study the history of the Soviet Union using methods of intelligence. The first rule is: do not believe what is officiously demonstrated to you; seek what is hidden. They are demonstrating the “unpreparedness” of the Soviet Union for the war, but hiding the offensive war plans.

There are documents that point directly to the fact that the Soviet Union was readying itself for an offensive against all of Europe in the summer of 1941. I figured out that one of those documents was kept in the Central Archive of the Russian Ministry of Defense, in holding #16, register #2951, case #241, pages 1 through 16. It is a long story. I would have to write a separate book about how I managed to figure out that this document exists. Juxtaposing facts and evidence, I came to the conclusion that on March 11, 1941, Marshal Timoshenko and Generals Zhukov and Vasilevsky, the heads of the USSR People’s Defense Commissariat, forwarded to Stalin the plan of invading Germany. Both generals became marshals two years after that.

While talking on BBC radio on August 17, 1996, I addressed the Russian leaders. I told them: “If you have nothing to hide, publish the document!”

What was left for them to do? They published the document. The book titled *1941* came out a year and a half later, in March 1998. It was a collection of documents. The collection was compiled by A. N. Yakovlev, a former member of the Political Bureau of the Central Committee of the Communist Party of the Soviet Union, E. T. Gaidar, a former head of the Russian Government, E. M. Primakov, a former head of the foreign intelligence service (who later became the head of the Russian government), and many other respectable politicians.

The answer to my public demand to publish the document came almost immediately, although the documents still had to be collected and the book prepared for print. The document I speak about can be found on page 741 of the first volume. I started reading it with excitement. But what was going on? Out of sixteen pages only five were published. The document starts with the description of the German army, and with suppositions about the intentions of the German command. That is all. Once the document goes into describing the Red Army Forces and the plans of the Soviet Union, there is a heavy square bracket, followed by an ellipsis, and another square bracket. After that one can see the signatures of Marshal Timoshenko, and Generals Zhukov and Vasilevsky. The document stops at the most interesting moment.

Two volumes are filled with garbage, documents that are completely insignificant. The leaders of the former Soviet Union ran out of paper before they could publish the war plan. Respectable Russian politicians act as petty crooks. The trick is very old: you take paper and cut it neatly; then you put it in a wad of money to make it seem bigger. That is exactly how they comprised the collection of documents they called *1941*. It looks like a serious publication, it has good solid binding, the paper is high quality, and names of respectable authors are on the cover. There is a lot of unimportant flimflam in order to distract the reader’s attention, but no substance, just emptiness.

I want to use this opportunity to repeat my demand: Rulers of Russia, publish document CA MD RF, H. #16, R. #2951, C. #241, pp. 1–16. I will tell you more: open the war archives! Sixty years have passed since the German invasion. It happened in *the first half of the last century*. Why are the archives still closed? What are you hiding from the world?

Until you stop fooling the world with your grifter tricks, I will be forced to use methods of military intelligence to study the history of the twentieth century.

The Struggle for Peace, and Its Results

We rely entirely on the hope that our revolution will unleash a European revolution. If the rising people of Europe do not crush capitalism, we will undoubtedly be crushed ourselves. Either the Russian revolution creates a whirlwind of struggle in the West, or the capitalists of all nations will strangle our revolution.

—LEON TROTSKY, SPEECH DURING SEIZURE OF POWER, THIRD SPEECH AT THE SECOND ALL-
RUSSIAN CONFERENCE OF SOVIETS, OCTOBER 26, 1917

World War I ended on November 11, 1918. Within forty-eight hours, on the morning of November 13, an attempt was made to bring about a second world war. At that time the concepts and names “World War I” and “World War II” did not yet exist. The war of 1914–18, because it was a collision of gigantic empires, was called the Imperialist War. It was also called the Great War, because it surpassed all previously known wars in magnitude, expenditure, and number of participants. No previous wars had known such extended fronts, such intense battles, such massive losses, or such great social and economic consequences. The barbarity of a global slaughterhouse was so obvious that an overwhelming majority of people considered a repeated occurrence of such madness impossible. For this reason, the war of 1914–18 had another name, which is now forever forgotten, the Last War. Many thought that the gory absurdity of the Great War would sober all its participants, and eternally eradicate the desire to fight.

Nevertheless, a small group of people existed in Russia, who dreamed that a second world war would be crueler, that the bloodshed would encompass not only Europe and part of Asia but all the other continents as well. These people called themselves Bolsheviks, or Communists. Vladimir Lenin headed the group, and called their organization a political party. However, the infrastructure, tactics, and strategies of Lenin’s group did not resemble those of a political party, but of a small, well-organized, conspiratorial cult. Lenin’s party had a perceptible structure, parallel to which ran a secret, invisible organization. Just like a mafia organization, Lenin’s party had open and entirely legal associations and undertakings, along

with a secret unifying force that always remained in the shadows. On the one hand, representatives from Lenin's party sat in the Russian parliament (the Duma). On the other hand, Lenin and his followers believed the party's funds could be enhanced by any means, including bank robbery. They reasoned there was nothing wrong if occasionally, during the robberies, arbitrary casualties arose, as long as the most important goal of maintaining money in the party cashbox was met. From this point of view, Lenin's cult must be called an organized crime gang, not a political party of a new sort.

The leaders of this cult concealed their real names. Lenin, Trotsky, Stalin, Zinoviev, Kamenev, Molotov, and Kirov: these are all aliases. They all had serious reasons for not revealing their true names. For example, under the alias of "Stalin" hid a bank robber whose real name was Dzhugashvili. He was in charge of filling the party's cashbox.

Lenin and his gang worked hard to draw out World War I as much as possible. As early as September 1916, during the peak of the war, Lenin declared that one world war might be insufficient, and humanity might need another one of the same or even greater destructive scale. He reasoned that war is the mother of revolution, and world war is the mother of world revolution. The longer the war lasts, the more bloodshed and destruction it brings, the sooner revolution takes place. If a world revolution did not arise as a result of the first world war, a second world war becomes necessary.

Lenin's party was not only the most militaristic in the world, but also the most peace-loving. In 1914, almost all political parties of the nations at war voted in unison in the parliaments of their countries to create war credits. Lenin's party counted among the very few exceptions. Together with another branch of Russian Social Democrats, the Mensheviks, Lenin's party voted against increasing military expenditures, despite the obvious understanding that during wartime military expenditures cannot be the same as during peacetime. On July 26, 1914, during an emergency session of the Duma, the Bolsheviks and Mensheviks left the meeting hall "as a protest against the current military insanity."

Lenin's party began an unprecedented campaign for peace. By September–October of 1917, the Bolshevik party had seventy-five newspapers and magazines, with a total daily run estimated as high as 600,000 copies. All these publications advocated for immediate peace. The Communists distributed their publications free of charge in city streets, in factories, in military barracks, and in the trenches at the front. On top of the newspapers and magazines, Lenin's party printed millions of books, brochures, pamphlets, and proclamations. Soldiers were told to try to establish friendly relations with the enemy, instead of shooting at them. Communist slogans urged the troops: "Put down your rifles!" "Go home!" "Let's transform the Imperialist War into a Civil War!"

In the fall of 1917, under the leadership of Leon Trotsky and Vladimir Lenin, the Communists carried out a coup and seized control of the capital of the Russian empire, Petrograd (formerly St. Petersburg). For the first time in world history, a group of people living and working under fake names gained control of the capital of such a vast country. Most nations of the world did not recognize the new authorities as legitimate. The only exceptions were countries with which Russia was at war, Germany and Austria-Hungary. Only the enemy recognized Lenin's command. German money was secretly transferred to Lenin's party—both before and after the coup.

Moments after the new power came into being, the first official document—the Peace Decree—was created and signed. The army and navy immediately ceased all military activity.

Every regiment elected committees of soldiers. Delegates from each regiment began conducting their own peace talks with the enemy. They paid no attention to their regimental or division commanders, or higher authorities. At first every regiment, and later on every battalion, independently designed the conditions for peace, without taking into consideration the demands of the other battalions. The Russian army crumbled into hundreds of uncontrollable regiments and thousands of battalions, ceasing to exist as a single unified organism. The front collapsed. Nobody was left to defend Russia. Following the decree to stop fighting, Lenin and his cohorts immediately instituted committees to demobilize and take apart the Russian army.

No major power had ever voluntarily dismantled its army during peacetime. Yet Lenin and Trotsky demolished the Russian army during the peak of World War I, when victory was within their grasp. Germany's position was already completely hopeless during this time. Germany had almost no natural resources. Germany and her allies were blockaded, and had no supply route by sea. Russia's natural resources, in contrast, were limitless. In the fight against Germany, Russia was allied with the mighty French and British colonial empires. In April 1917, the United States of America joined the conflict and declared war on Germany. Against such formidable adversaries, Germany could not have triumphed under any circumstances. All Russia had to do in the given situation was to patiently wait for Germany to beg for peace.

Instead, what happened was something even the German Kaiser could not have dreamed of. The Russian army, acting under Lenin and Trotsky's orders, abandoned its trenches and went home. Thousands of guns, mortars, machine guns, millions of small arms, and huge stores of ammunition, uniforms, and supplies were left behind on the frontlines. Lenin's "Peace Decree" was an act of Russia's utter capitulation before Germany. From this moment the Eastern Front ceased to exist. Germany received the chance to concentrate its efforts on the Western Front against Russia's former allies. In adopting the "Peace Decree" Russia betrayed her allies. Lenin and Trotsky singlehandedly brought Russia out of the war and made their country subject to Germany's mercy.

Despite Russia's withdrawal, the situation in Germany and Austria-Hungary continued to worsen. A general strike broke out in Austria-Hungary in January 1918. During the same month, a general strike was called in Germany. Both countries stood on the verge of chaos. Russian Communists saved their day. To be capable of fighting in the war as long as possible, Germany needed strategic resources in large quantities. Lenin and Trotsky again came to Kaiser Wilhelm's aid. They signed the Brest-Litovsk Treaty in March 1918. The Russian Communists, without battle, handed over approximately a million square kilometers of their territory to the Germans. Fifty-six million people, about a third of the Russian empire's population, inhabited this territory. The occupied area encompassed more than a quarter of the nation's cultivated lands; it housed 26 percent of the railways, and major industrial capabilities. Seventy-three percent of Russia's iron and steel was cast in these territories, and 89 percent of Russia's coal was mined there.

Most important of all, these were Russia's most fertile lands. Mass export of food to Germany began immediately. A financial agreement, signed on August 27, 1918, stated that Russia had to pay Germany war reparations totaling 6 billion marks.¹ Without such a gift, Germany would have been unable to support herself until November of 1918.

Communists are proud of their love of peace. However, the stubbornness with which they fought for peace far surpasses common sense, to the point of suspicion. For the sake of

peace, Lenin and Trotsky sacrificed 56 million of their subjects, without considering their wishes and needs. What good was peace for these people, if their homes were taken over by foreign occupants? For the sake of peace, Lenin and Trotsky handed Russia's most fertile lands over to Germany, causing widespread famine in the remaining territories. Without bread, meat, gold, steel, iron, and coal, Russia could not exist. What good is peace if it brings the death of the nation?

It was clear that Germany could not successfully continue to fight on two fronts, but the defeat of Germany would mean the end of the war. Consequently, Lenin's task, to prolong the war, was to create a situation in which Germany fought on only one front. For this purpose, he took Russia out of the war. Lenin's plot was simple: let Germany and Austria-Hungary fight against Great Britain, France, and the United States. Let them wear out each other's strengths. Most importantly, do not allow the flames of war to be extinguished. Russia would remain on the side and add fuel to the fire. While "peace" was being made on Lenin's orders in Brest-Litovsk, intensive preparations for a revolt against the German government were underway in Petrograd. The revolutionaries published half a million copies of a Communist newspaper in German, *Die Fackel* (The Torch). Even before the Brest-Litovsk Treaty was signed, in January 1918 a German Communist organization, *Spartakus*, was formed in Petrograd. The newspapers *Die Weltrevolution* (The World Revolution) and *Die Rote Fahne* (The Red Banner) were also born, not in Germany but in Russia under Lenin's orders, while he made peace with Germany's government. Communism would become deeply rooted in Germany in the 1920s. Part of the credit for this goes to Lenin, who fueled the instability of German politics precisely at the time when he had a peace treaty with the German government. While Germany was conducting a hopeless and devastating military campaign in the West, Lenin was subverting its political system.

Finally, World War I ended. In November 1918 Europe's condition was exactly what the Kremlin leaders had hoped it would be. The economic hardships caused by war had reached their limits in all the nations. Europe was facing an unprecedented crisis that encompassed all spheres of life, including the economy, politics, and ideology. Germany admitted her defeat. The monarchy crumbled. Anarchy and famine ruled the land.

Just then, Lenin and Trotsky's love for peace vanished. The government of Soviet Russia issued, on November 13, 1918, an order for the Red Army to begin offensive operations against Europe.

A review of the protocols of any of the countless meetings and congresses of that period reveals that the only question on the agenda was the World Revolution. The aim of the Soviet advance narrowed down to installing Communism on the European continent. In a few days, the Red Army crossed into the Baltic countries. The Communist government of Estonia was formed on November 29, that of Latvia on December 4. Lithuania followed on December 8, 1918. On December 17, a manifesto published in Riga named Germany as the imminent objective of the offensive. The most important goal of the operation: fuel a new world war.

Lenin's calculations were precise: Worn out by World War I, the German empire is unable to bear the pressures of another war. The war ends with the crushing of the empire and is followed by a revolution. In war-torn Europe, on the remaining fragments of the old empires, Communist countries arise, remarkably similar to Lenin's Bolshevik regime. Lenin was ecstatic: "We are at the doorstep of world revolution!"

2

First Attempts to Unleash a Second World War

The West, full of imperialist cannibals, has turned into the hearth of darkness and slavery. Our task lies in destroying this hearth, and bringing happiness and consolation to all worker nations.

—JOSEPH STALIN, MOSCOW, DECEMBER 15, 1918

As a result of World War I, Europe found itself in a situation which the Communists called revolutionary. In 1918 Communist parties formed in many European countries. In Kiel, German navy seamen called a strike on November 3, 1918. Two days later, the strike spread to all of northern Germany, and on November 7–8 it reached the main industrial regions and the capital city, Berlin. The strikes were suppressed, or subsided on their own. But in January 1919, a Soviet republic was declared in Bremen. The Hungarian Soviet Republic formed in March. In April, the Bavarian Soviet Republic followed. Following the Soviet example, these Communist nations formed Red Armies and secret police squads, which called themselves “extraordinary commissions in the struggle against counterrevolution.” These extraordinary commissions immediately instigated a reign of terror against all layers of society, and the Red Armies threw themselves into revolutionary wars to “liberate” the neighboring nations. A part of the Hungarian Red Army marched into Slovakia and, on June 20, 1919, proclaimed the Slovak Soviet Republic. A Communist government formed immediately and declared a policy of nationalization of all private lands and annulment of private property. It nationalized all commercial enterprises, banks, and transportation systems. For silencing the voices of discontent, they formed the Slovak Red Army and Extraordinary Commission. At the same time Soviet Ukraine declared war on Romania, and began preparations to advance west, to connect with Soviet Hungary.

Lenin and Trotsky prepared to establish Communism in Asia as well as in Europe. On August 5, 1919, Trotsky wrote a secret memorandum arguing that “the road to Paris and London lies through the cities of Afghanistan, Punjab, and Bengal.” He proposed “preparations for a march on India, to help the Indian revolution.” To achieve this goal Trotsky said

it was necessary to form “a political and military command center of Asian revolution, and a revolution academy” in the Urals or in Turkestan, to form a special corps of 30,000 to 40,000 horsemen and “unleash them on India” to help the “native revolutionaries.”

Civil war raged in Russia and distracted the efforts to ignite a second world war in 1918 and 1919. The main resources of the Red Army were tied up on internal fronts fighting against those who opposed Communism. Lenin and Trotsky were not able to send aid to the Communist nations that sprouted in Central Europe, nor could the Red Army reach Germany.

In 1919 in Moscow, Lenin and Trotsky created the Communist International, abbreviated as Comintern. This organization defined itself as “the Headquarters of World Revolution.” The goal of the Comintern was the creation of a “World Soviet Socialist Republic.” Thus began the process of creating and strengthening Communist parties on all continents. These parties constituted sections of the Comintern and were subordinate to its leadership.

Allegedly, all Communist parties in the world, including the Russian party, had an equal status. They all contributed to the communal bank of the Comintern. Delegates from all Communist parties of the world held congresses, developed strategies and tactics, and elected a common leadership—the Executive Committee of the Comintern. This organ oversaw all the Communists of the world. The Communist Party of Russia officially was a section of the Comintern, on equal footing with all the other parties, and bound to abide by commonly developed decisions.

In practice, however, the reality was an entirely different story. All the funds in the Comintern budget came from the gold reserves of Soviet Russia. All the Communist parties of the world were paid for by Moscow and existed only through financing from the Kremlin. The Comintern itself was also created with Kremlin funds. The leaders of the Comintern lived and worked in Moscow, under tight control of the Soviet secret police. All their directives came from the Kremlin. Only those who were agreeable to the Kremlin leaders, and who carried out all their orders without dissent, were chosen.

The Comintern was unique. Never before had history seen anything like it. In practically all the nations of the world, from Japan to Uruguay and Chile, Communist parties sprouted and conducted a line of politics that was dictated from Moscow. In many cases, delegates from Communist parties in those countries were members of trade unions, of legislative bodies in their governments, and sometimes even members of governments—but that was only the visible side of Comintern activity.

At the same time, Communists conducted not only an open struggle, but also a secret one. Stated briefly, their ideology narrowed down to advocating:

- The old world must be destroyed, and a new one built in its place.
- To destroy the old world and build a new one, it is necessary to gain political power. Gaining political power requires using all measures, ranging from the most peaceful to the most violent, from the most open to the most secretive.
- The struggle for a new world must unfold not on a national scale, but on a world scale. The interests of the World Revolution are more important than the interests of individual countries.

Every person joining the Communist Party accepted this ideology, meaning he or she agreed to fight against the interests of their own nation, if it became necessary, and to use all

methods, including covert and violent action. Suddenly the intelligence services of the Soviet Union received legions of volunteers from practically every nation in the world. All that remained was to select the most competent ones, train them, finance them, and assign them to missions in the fight against their own countries and governments.

In the 1920s Soviet intelligence suddenly became the most powerful intelligence organization in the world. Thousands of Germans, Czechs, Hungarians, Americans, English, Japanese, and French selflessly worked in the name of a bright future for all humanity. In actuality, they worked for the interests of the Kremlin.

On June 28, 1919, the Versailles Treaty was signed, establishing peace between Germany and the allied victors. Victors always come in large numbers. The victors, aside from Great Britain, the United States, and France, also included Bolivia, Guatemala, Haiti, Cuba, Ecuador, Honduras, Liberia, Nicaragua, Panama, Peru, Uruguay, and many others. However, overall the Versailles Treaty was a treaty between vanquished Germany and victorious France and Great Britain, which had the full support of the United States of America.

The conditions dictated by the Allies at Versailles demanded from the vanquished country virtually complete disarmament. All military drafts were abolished in Germany, the number of armed forces fixed at 100,000, the General Staff and all academies disbanded. The treaty forbade the creation of a new General Staff and new academies. Armed forces could only be assembled through voluntary enlistment and used only for maintaining internal order and security. The surface naval fleet was cut drastically; the submarine fleet was abolished completely. The majority of German fortifications were to be blown up. Germany lost the right to have heavy artillery, tanks, submarines, and aviation (including blimps). It was forbidden to have or to design chemical weapons, and all supplies of poisonous gas were destroyed. The treaty also strictly forbade all import into Germany of any weaponry or war material. Arms production in Germany fell under international control.

Germany lost 67,273 square kilometers, one-eighth of its territory, with a population of 5,138,000 people. Germany lost all her colonies. All merchant ships with a capacity over 1,600 tons' displacement were confiscated, as well as one-half of the merchant ships exceeding 1,000 tons' displacement, a quarter of the fishing fleet, and one-fifth of the river fleet. Germany was also required, for the next five years, to build for the Allies merchant ships, totaling 200,000 tons' displacement per year. Germany was obligated to supply France with up to 140 million tons of coal, Belgium 80 million tons, and Italy 77 million tons. Also, it was required to transfer to the winners half of its paints and non-military chemicals and to provide up to a quarter of the future production through 1925.¹ The Allies received the right to use German ports, railroads, and waterways on very beneficial terms. On top of all this, Germany was forced into paying astronomical amounts of retribution.

The Versailles Treaty was not only extremely unfair and degrading to Germany, it was ineffective and did not carry any basis for a lasting peace. The Versailles Treaty only contained the seeds of World War II. Lenin was the first to understand that World War I left a rocky legacy. The victorious allied nations, especially France, were carried away in demanding reparations from Germany. Forced into making huge payments to the victors, Germany faced a sharp economic crisis, and the German people experienced hunger, poverty, and constant misfortune.

Lenin was the first to understand that the Versailles Treaty was a bomb waiting to explode under Europe. Germany would never make peace due to the unfairness of the pact;

there would always be those who opposed the treaty, who would call out for revenge and act to get it. On October 15, 1920, Lenin declared: “The order held by the Versailles peace treaty lies over a volcano, since the seventy percent of the world’s people who are enslaved are anxiously awaiting someone to come and start a struggle for their liberation, and to rock the foundation of their countries.”²

Lenin did not know that this someone had already come. His name was Adolf Hitler. In September 1919 this someone joined the German Workers’ Party as number 007, and began the fight against the Versailles Treaty. This fight he called “My Struggle”—*Mein Kampf*.

In 1920 Russian Communists undertook a new attempt to spark a second world war by ripping through Poland into Germany. Although the most favorable conditions for revolution had already lessened, Germany in 1920 was still an acceptable place for class struggles. Germany was ruined and dishonored. All her ideals were besmirched and mocked. The country was enveloped in a harsh economic crisis; in March 1920 Germany experienced a general strike, estimated to have had more than 12 million participants. Germany resembled a powder keg, waiting for just one spark. The Red Army was supposed to bring this spark to Germany. The mood of the Red Army was reflected in its songs and marches. One of the most popular Soviet marches of 1920 included the words: “We’re getting Warsaw, Give us Berlin!” The contender for the unofficial march of the Red Army was another song of 1920 called “White Army, Black Baron,” which contained the famous verse:

Fanning the world fire,
We will level churches and prisons
Since from the vast taiga to the British seas
No one is more powerful than the Red Army.

In the summer of 1920, the western front of the Red Army, under the leadership of the ruthless General Mikhail Tukhachevski, began to advance with the objective of crushing Europe. Excerpts from order #1423 given to the western front on July 2, 1920, announced: “Fighters of the Workers’ Revolution! The fate of the World Revolution will be decided in the West. The path to the world fire lies over the dead body of White (anti-Communist) Poland. We will carry happiness and peace on our bayonets to the working people of the world. To the West! To decisive battles and thundering victories!”³

In the days when the Red Army was advancing toward the Polish cities of Warsaw and Lvov, a second congress of the Comintern was taking place in Russia. The Headquarters of the World Revolution then issued a call:

Brothers—Red Army Fighters, you should know your fight against the Polish slave drivers is the most just war in history. You are fighting not only for the interests of Soviet Russia, but for the interests of the whole of working mankind, for the interest of the Communist International. . . . Soviet Germany, united with Soviet Russia, will immediately become more powerful than all the capitalist powers combined! The Communist International declared that Soviet Russia’s goal is its own goal too. The international proletariat will not sheath its sword until Soviet Russia joins the Federation of the Soviet Republics of the World as an integral link.⁴

On July 23, 1920, directly from the Comintern congress, Lenin telegraphed Stalin at the Polish front: "Situation in Comintern is outstanding. Zinoviev, Bukharin, and I think that it would be proper to encourage a revolution in Italy. My personal opinion is that, to do so, Hungary has to be sovietized, possibly along with Czechoslovakia and Rumania."⁵ In a conversation with the French delegates to the congress, Lenin was even blunter: "Yes, the Soviet troops are in Warsaw. Soon, Germany will be ours. We will conquer Hungary again; the Balkans will rise against capitalism. Italy will tremble. Bourgeois Europe is cracking at the seams in the storm."⁶

The Red Army stepped onto Polish territory and immediately in the first occupied city declared the creation of the PSSR—the Polish Soviet Socialist Republic.⁷ Felix Dzerzhinski, the head of the Soviet secret police and an ethnic Pole, led the PSSR. By the end of the second congress of the Comintern, Warsaw was half surrounded by the units of the Red Army. Prior to the Polish counterattack, the Red Army crossed the Vistula River in the vicinity of the town of Włocławek—360 kilometers, or ten marching days, from Berlin.⁸

There was no common border between Soviet Russia and Germany. In order to spark the fires of revolution, it was necessary to tear down the dividing barrier—Poland. On September 22, 1920, Lenin spoke to the Ninth Conference of the Russian Communist Party and bluntly described the logic guiding the Bolsheviks in their drive: "The defensive war against capitalism is over, we have won. . . . We are now going to try to attack them, to help the sovietization of Poland. . . . We have set ourselves a task: to seize Warsaw. . . . It turned out that not just the fate of Warsaw is being decided, but the fate of the whole Versailles Treaty."⁹

To the Communists' misfortune, Tukhachevski, who did not understand strategy, was in command of Soviet troops. Tukhachevski's armies were crushed near Warsaw and fled in disgrace. In the critical moment, Tukhachevski lacked strategic reserves, and this decided the outcome of the grandiose battle. This time, Europe was fortunate. The Soviet Communists had to postpone the revolution in Europe until 1923.

3

The First Contact

If a revolutionary shake-up of Europe is to begin, it will be in Germany . . . and a victory of the revolution in Germany will secure the victory of the international revolution.

—JOSEPH STALIN, *WORKS*

The crushing of Tukhachevski's army in the summer of 1920 in Poland created unpleasant consequences for Russian Communists. The Russian people, whom the Communists, it seemed, had succeeded in drowning in blood and completely subordinated to their control, suddenly made a last-resort attempt to rid themselves of the Communist dictatorship. At that moment, Lenin and Trotsky were making preparations for a new world war. On December 22, 1920, Lenin advised his fellow party members: "We ended one line of wars, we must prepare ourselves for the second."¹ Lenin was ready for any sacrifice in the name of war: "We are severely lacking in everything, yet we are no poorer than Viennese workers. Viennese workers die, starve—their children also die, starve—but they do not have the most important thing that we possess: hope. They die, oppressed by capitalism, they find themselves in a position to make sacrifices, but their sacrifices are not like ours. We sacrifice for the sake of the war that we are waging against the entire capitalist world."²

However, the Russian people demanded peace, not world domination. St. Petersburg, the "cradle of the revolution," experienced one workers' strike after another. The workers demanded bread and freedom. The Bolsheviks crushed the workers' demonstrations, but in March 1921 all of a sudden the Baltic fleet intervened on the workers' behalf. The sailors of the seaport city of Kronstadt (a naval base), the same ones who gave power to Lenin and Trotsky, now sought their freedom from Communist rule. They demanded that the Soviets (the workers' and peasants' councils, the basic organizing units of society created by the Communists) be purged of Communists. In addition, the nation experienced a wave of peasant uprisings. In the forests of the Tambov region, peasants formed an anti-Communist army—well organized, but poorly armed.

The peasants' and sailors' uprisings and the workers' demonstrations were crushed by the same man who lost the Polish war, Mikhail Tukhachevski. He showed inhuman cruelty, and disregarded all international rules of law and human rights. Under his leadership thousands of hostages were executed by firing squad, peasants were shelled with poison gas, and villages were burned. Villagers were drowned in swamps; sailors were drowned, pushed into holes cut in the ice.

Communist leaders were desperately looking for a way out of the crisis. The Comintern, finding itself in this desperate situation, made a decision that the only thing that could save Bolshevism was a revolution in Germany. The head of the Comintern, Grigori Zinoviev, sent his loyal follower, the Hungarian revolutionary Bela Kun, to Berlin. Kun, who in 1919 had been the actual head of the short-lived Hungarian Soviet Republic, arrived in Berlin in March 1921 with an order from Zinoviev and the Executive Committee of the Comintern to the Central Committee of the German Communist Party to seize power. For this the German Communists had to organize an immediate uprising and abolish the Weimar Republic.

On March 22 a general strike was declared in the industrial regions of central Germany. On March 24 the Communists took control of government buildings in Hamburg. In Leipzig, Dresden, Chemnitz, and other cities of central Germany, the Communists organized a takeover of courts, municipal buildings, banks, and police headquarters. The official organ of German Communists, *Die Rote Fahne*, openly called for revolution.”³

Walter Krivitsky, one of the most highly positioned chiefs of Soviet intelligence, who took part in the events, wrote: “We were sent to Germany for reconnaissance, mobilization of dissident elements in the Ruhr region, and preparation of workers for an opportune moment to start an uprising. We immediately formed three types of organizations in the German Communist party: an intelligence and reconnaissance service, acting under the supervision of the Fourth Directorate of the Red Army; military formations to serve as the core of the future Red Army of Germany; [and] small fighter squads, whose orders included lowering the morale of the *Reichswehr* (German Army)”⁴ (The intelligence officers of the German and all other Communist parties worked under the leadership of the Fourth Directorate of the Red Army. The Fourth Directorate, after changing its name several times, subsequently became known as the Main Intelligence Directorate of the General Staff of the Soviet Armed Forces, or GRU.)⁵

Although the attempt to take control of Germany in 1921 suffered defeat, in Moscow preparations immediately began for a new seizure of power in Germany and the world. On December 30, 1922, the Union of Soviet Socialist Republics (USSR) was born. In this name there are no national or geographical limits. According to the plans of the founders of the USSR, the Union was meant to spread throughout the world. The “Declaration of the Founding of the Union of the Soviet Socialist Republics” proclaimed that the USSR is only the first decisive step in a creation of the World Soviet Socialist Republic. The number of republics was planned to expand until the entire world formed one giant Communist state. The Founding Declaration of the USSR was an open and direct declaration of war to the rest of the world. This was an official document that stated the main purpose of the existence of the giant state: to destroy and subordinate all remaining states of the world.

The coat of arms of the USSR contains an image of the globe with symbols of Communism superimposed upon it. On the day of the formation of the USSR, a member

of the Central Committee of the Communist Party, Sergei Kirov, proposed to build a “Palace of the Soviets.” Kirov explained: “This building must serve as the symbol of future might, the victory of communism not only here, but also there, in the West.” He emphasized that the palace must be built for the purpose of holding the ceremony of acceptance for the final republic into the Soviet Union. At that time, nobody could forecast which republic in particular would be the last to come into the Union of Soviets—the Argentine Soviet Republic or the Uruguay Soviet Republic—but the Soviet Communists were certain that this moment would inevitably come.

Attempts to unleash a war and revolution were repeated by the Soviet Communists many times over. There was an attempt to start a “Balkan revolution,” and obtain, in Trotsky’s words, a direct route from the Balkan region to the ports of France and Britain.⁶ An assassination attempt was made against the Bulgarian Tsar Boris, but miraculously he survived. In September 1923 armed uprisings began in Bulgaria, started on the Comintern’s orders. On September 27, 1923, the Soviet Politburo ordered ten Bulgarian Communists (officers and pilots) to the navy base in Sevastopol. If a nearby Bulgarian city close to the shore was in rebel hands, the pilots would establish a connection by airplane between the south of Russia and Bulgaria. Then, “upon the establishment of the connection, to send out arms that have been in Sevastopol since last year, prepared for the Bulgarian revolution . . . and . . . send Bulgarian Communists currently in Moscow and other Russian cities to Bulgaria with arms.”⁷ The leader of the uprisings was Georgy Dimitrov—future head of the Comintern. Attempts were also made to spark revolutions in South America, Estonia, Latvia, Lithuania, China, India, and many other countries.

However, Germany remained the ultimate objective. One of the several attempts to take power in Germany is especially interesting. This attempt was undertaken in the fall of 1923 when Lenin no longer participated in the leadership. The reins of power were almost completely in Stalin’s hands, although neither the country, nor the world, not even his rivals within the party, had come to understand this. Stalin’s personal secretary, Boris Bazhanov, described the preparations for seizure of power in Germany: “At the end of September an emergency meeting of the Political Bureau of the Central Committee of the Russian Communist Party of Bolsheviks (the former name of the Communist Party of the Soviet Union—the CPSU, as it was renamed in October 1952) was held, so secret that it was attended only by the members of the Politburo and myself. No regular member of the Central Committee was permitted to be present. This meeting was called in order to fix a date for a coup in Germany. It was decided on November 9, 1923.”⁸

Bazhanov wrote that the funds earmarked to support the German revolution were tremendous, and a decision was made to support the effort without limits. Inside the Soviet Union, all Communists of German origin and all Communists who knew the German language were mobilized. They were trained and sent to Germany for underground work. Not only regular Soviet Communists were sent to Germany, but leaders of higher rank as well, among them the People’s Commissar (member of the cabinet of ministers of the Soviet government) Vasily Schmidt, the members of the Central Committee of the Soviet Communist Party Karl Radek and Grigory Piatakov, the candidate for membership to the Politburo of the Communist party of the USSR Nikolai Bukharin, and many others. In 1923 many others, also under aliases, arrived in Germany: Tukhachevski, Unshlikht, Vatsetis,⁹ Menzhinskii,¹⁰

Trillisser,¹¹ Yagoda,¹² and many others. The Soviet ambassador to Germany, Nikolai Krestinski, formed a powerful web of secret intelligence. The Soviet embassy transformed itself into the headquarters of the revolution. Through it orders were passed from Moscow, along with a flow of funds, which were immediately transformed into a storm of subversive propaganda, arms, and war supplies.

The Comintern commission dealing with German affairs consisted of the entire Soviet leadership: Stalin, Trotsky, Zinoviev, Bukharin, and Radek. Stalin thought that it was necessary to avoid at all cost anything that might reveal that the revolution was “dictated” or “instigated” by the USSR. The plan was simple: November 7—the anniversary of the Communist takeover in Russia—would be the day for workers’ demonstrations of solidarity in Germany. Special units, trained in Moscow by Communist secret police and military intelligence under the supervision of Joseph Unshlikht, would act as *provocateurs* and incite conflicts with police. Their goal was to cause violent clashes and arrests thus inflaming the anger of the workers. On November 8, the clashes were to grow from street fights into more serious threats. On the night of November 9, Unshlikht’s units were to seize the most important government establishments, making it appear to be a spontaneous reaction of the masses against police brutality.

The script was simple, yet reliable. The so-called “Great October Socialist Revolution” followed the same script; so did the “proletarian revolutions” in Estonia, Lithuania, and Latvia in 1918 and in 1940. Following this blueprint, Communists took control of many states after World War II: a “spontaneous demonstration” of workers, the wrath of the people—and small units of cunning professionals.

The difference was that in the German revolution of 1923 the Communists had reliable allies: the Nazis. At this point in time, the German Workers’ Party already had a new name—it was the National Socialist German Workers’ Party (NSDAP was the German acronym)—and it had a new Fuehrer: Adolf Hitler. “A slogan of the Comintern was: ‘War on Stresemann [the chancellor and foreign minister of Germany]’¹³ and Poincaré [the prime minister of France]!’¹⁴ A slogan of the Nazis was: ‘War on Poincaré and Stresemann!’ There had even been talks between Radek and certain leaders of the Nazi party.”¹⁵

Karl Radek was a member of the Executive Committee of the Comintern and a member of the Central Committee of the Communist Party of the USSR. He had been to Germany several times with the goal of triggering a revolution. In 1919 he was arrested by German authorities, but was quickly sent home. In 1923 he once again returned to Germany. Could any of the Nazi party leaders conduct talks with the member of the Executive Committee of the Comintern, Comrade Radek, without having Hitler’s express consent for doing so? And could Karl Radek conduct talks with Nazi leaders without a direct order from Stalin? It is remotely possible that Radek acted on his own but, knowing Stalin’s obsession with control, it is highly unlikely. Stalin told the Central Committee that “[a] German committee of the Comintern, consisting of Zinoviev, Bukharin, Stalin, Trotsky, Radek, and a number of German comrades, adopted a number of specific decisions dealing with the direct assistance to the German comrades in [the] task of seizing power.”¹⁶ Radek expressed an open enthusiasm for Hitler’s storm troopers and said: “We can see on the faces of German students wearing brown shirts the same devotion and the same inspiration which shone on [the] faces of Red Army officers.”¹⁷ Radek praised the storm troopers as “great guys,” adding: “You will see that they will fight for us, lobbing hand grenades.”¹⁸

Let's examine the dates. In August of 1923, Stalin decided that "German Communists, by themselves, will have to seize power in Germany." After this, in October, high-ranking Soviet officials were sent to Germany, and one of Stalin's agents conducted talks with the Nazis and discussed cooperative actions. In other words, the Soviets were saying on the one hand, "Dear Nazis, please help the Communists take power in Germany." On the other hand, they were saying "Let the Communists rule Germany by themselves."

This is a familiar Communist maneuver, and it was Stalin's personal trademark. Communists took power in Russia in alliance with other parties. Then they destroyed their allies after they became useless. Stalin personally acted in the same fashion. He eliminated his political adversaries by using his allies, and then eliminated the allies.

The Communist and Nazi parties did attempt a joint takeover in Germany in 1923. Communist propaganda wants us to believe that in 1923, there was no conspiracy between Communists and Nazis. However, on November 8, 1923, in Munich Hitler and a group of armed followers tried to arrest the government of Bavaria. Hitler declared that the revolution had begun, that the Bavarian and Weimar governments were demolished. A new "government" was formed immediately. On the night of November 8, a group with Ernst Roehm at its head took control of the headquarters of the military district.¹⁹ Attempts to take over other infrastructure and government facilities were put down by the army and the police. On November 9 Hitler proclaimed a demonstration of his supporters. A clash occurred between the demonstrators and the armed police; sixteen of Hitler's supporters and three police officers were killed.

The attempted takeover was crushed by force. Hitler and his closest associates fled, but were soon captured, stood trial, and were sent to serve prison terms in the Landsberg fortress. It was from this prison cell that Hitler wrote *Mein Kampf*. Later, when he came to power, Hitler declared his fallen associates national heroes, and named the dates of the rebellion, November 8–9, as the most important German national holiday. An interesting note: the book *Mein Kampf* is dedicated to Hitler's sixteen fallen comrades, killed on November 9, 1923. But in the huge text (the first volume alone consists of almost six hundred pages in small print) Hitler writes nothing about the events of November 8–9. Hitler wrote the book in a prison cell, but does not mention why and how he came to be behind bars. For some reason, Hitler conceals all that preceded these events. Instead of a detailed explanation, the last page briefly states: "I will not venture here into discussions about events which led us to November 8, 1923." That is all.

This seems strange. The book is titled "My Struggle," and the author describes himself, his party, and his struggle for influence over the masses and for power. The events of November 8–9, 1923, are the culmination point of this struggle, after which Hitler's party was outlawed and he was imprisoned. At the time Hitler wrote his book, nothing more important had happened in his life or in the life of his party than the events of those two days. And yet he omits a description of these most important events.

In fact, he had something to hide. Hitler's failed revolution coincided in a most peculiar fashion with the failed Communist revolution. There are several coincidences, and they are astonishing. The date of the revolution was set in Moscow and kept under the utmost secrecy. But Hitler decided to conduct his coup on the same day, under the same red flag, shouting the same slogans calling for the expropriation of non-workers' income, the nationalization of industrial conglomerates, and the confiscation of German industrialists' war profits. Hitler's

tactics completely paralleled the ones Moscow dictated to its agents: conduct demonstrations despite bans on such actions, provoke clashes with police forces, and seize government buildings. There was a total convergence of goals, methods, place, and time down to the hour and minute of the act.

Even stranger, Lenin, Trotsky, and Stalin believed in plots, coups, and the seizure of power by a well-organized minority. This is precisely what they accomplished in Russia, and many times over tried to repeat in other nations of the world. Hitler had a different method. Hitler was a demagogue, an agitator. *Mein Kampf* is a tale of a leader of masses, who knows how to handle the crowds, how to win their trust and affection. *Mein Kampf* is a book about how to obtain power through legal means, but there is not a word in it, not a hint, about underground methods akin to those used by Lenin and Stalin. In the sphere of legal open struggle for power over the masses, Hitler was much stronger than Lenin, Trotsky, and Stalin. But in the sphere of mutiny and plots Hitler was clearly weaker. He was not even prone to think in this direction. Ten years later, he came to power through legal means, through agitation, propaganda, and voting booths. Hitler's way was that of loud speeches and dramatic uplifting parades. He understood his full strength as an orator, and was proud of it.

Then why was Hitler in 1923 drawn to the Lenin-Stalin methods of taking power through armed conflict and at the same time as a coup staged by Moscow? For nearly a century, Soviet and East German historians have been telling us that this was merely a strange chain of coincidences. Sometimes this happened: Communists decided to stage a coup, and Hitler decided the same thing—on the very same day. In fact, Soviet Communists made attempts to use Hitler and his party for destabilizing the political situation in Germany long before Hitler's coming to power.

Stalin's Role in the Rebirth of German War Power

Only one country—Soviet Russia—can win in the event of an all encompassing conflict.

—ADOLF HITLER, DURING A MEETING WITH LORD HALIFAX,
THE BRITISH FOREIGN MINISTER, NOVEMBER 19, 1937

After World War I, Central and Western Europe were in such a debilitated state that a large war could not arise because no nation was capable of starting one. France was among the main victors. Under the terms of the Versailles Treaty, Germany paid huge reparations to France, and the French had no motive to start a new war in Europe. The main concern of the French government was to maintain the new existing situation in Europe as long as possible. French generals chose strictly defensive strategies. They built the Maginot Line along their border, fashioned after the Great Wall of China.

Great Britain was also among the victors. Great Britain had no claims on any territories in Europe. Therefore, Great Britain had no desire to see a new European war. Great Britain's interests included preserving the newly formed balance of power in Europe. Britain was at the center of the greatest colonial empire in history, and its main interests lay outside of Europe: to preserve its colonies. Great Britain had a powerful navy to defend its colonies and trade routes, and a relatively small army to defend the homeland and maintain order in the colonies. Even if the British government had the desire to start a new war in Europe, its army was insufficiently strong to do so.

Germany, according to the Versailles Treaty, was completely disarmed. The Versailles Treaty not only demanded that Germany pay dues, dues, and more dues to France, but it also forbade Germany to have, buy, construct, test, or produce any offensive arms, and strictly limited defensive arms. The remaining Central and West European nations could not unleash a large war because they did not have sufficient economic or military might to do so and, most importantly, they had no desire to do so.

The Kremlin leaders in this situation could have breathed a sigh of relief and completely devoted themselves to the building of a peacetime economy. In order to avert war in Europe,

all that was necessary was to make sure the Versailles Treaty was not breached, that Germany stayed disarmed and weak militarily. Germany was Russia's main opponent in World War I and her most likely opponent in any future conflict. Soviet Russia was not a signatory of the Versailles Treaty, but the pact did give Russia, which turned into the Soviet Union, invaluable advantages. The Soviet Union could produce any model of weapon or military technology. Meanwhile, Germany not only stood still in terms of military progress, it fell far behind.

The Kremlin leaders should have used all the powers of the Soviet diplomacy and intelligence services to uncover and root out all attempts to revive the German military machine. Let Germany stay weak! If Germany does not have tanks, aviation, heavy artillery, poison gases, submarines, if Germany has no trained panzer corps, pilots, navigators, if the German generals are banned from developing new tactics and methods of conducting operations, if German engineers do not have the ability to create new models of weapons, and factories do not produce these weapons—then Germany would never start a new war.

But the Kremlin leaders did not order their intelligence services to undertake a mission for the strict execution of and adherence to the Versailles Treaty. They did the opposite. A secret reorganization of the German army began with the help of the Soviet government. Moscow gave the German commanders all that they were forbidden to possess: tanks, heavy artillery, war planes, training classes, and weapons testing and shooting ranges. Germany was also provided with access to the Soviet factories that produced tanks and airplanes that were the most advanced in the world so the Germans would be able to look, to memorize, to copy. Stalin allowed the German government to create secret design bureaus and training centers on Soviet territory.

On November 26, 1922, an agreement about the production of metal airplanes and plane engines was signed with the German aviation firm Junkers Flugzeugwerke. It was this agreement with Junkers that paved the way for large-scale Soviet-German military cooperation. In July 1923 two new agreements were set out: one was about the production of munitions and military equipment and the other about the construction of a chemical plant. On April 15, 1925, an agreement was signed about the creation of a secret air force center in the Russian city of Lipetsk for training German military pilots. One hundred D-XIII-type military planes were bought by the Soviet government for Germans from the Dutch company Fokker. The preparations for the blossoming of the Third Reich's airpower had begun. Over the years, the German models Heinkel He-45, He-46, He-51, Arado Ar-64 and Ar-65, Junkers K-47, and Dornier Do-11 were successfully developed and tested in the USSR for the Germans. By the end of 1933, the school had prepared 450 fighter pilots, air reconnaissance observers, and members of bomber squads. Many of them later entered the core of *Reichsmarschall* Hermann Goering's command staff. It is safe to say that the Luftwaffe (the German air force) was born in the Soviet town of Lipetsk.

Nobody was supposed to know that Stalin was preparing Germany for a new world war. Planes, designed for training and testing, arrived by non-stop flights at high altitude.

All those Germans who headed to the German aviation school in Lipetsk were formally discharged from the *Reichswehr*. Their names were changed. The return of bodies of those who perished during the frequent training accidents was quite a challenge. They were sent by sea through Leningrad, in containers labeled "Mechanical Parts." Their relatives were not told of the true causes of death.

Stalin understood that the new war would not only be an air war, but a tank war as well. Therefore, he gave particular attention to preparing German Panzer corps. In 1926, near the Soviet city of Kazan, a tank school for the *Reichswehr* was created. German tankers wore Soviet uniforms there. Stalin fully equipped future German Panzer generals: he gave them tanks, fuel, ammunition, transport, housing, repair facilities, and a gigantic well-guarded weapons range—to create, to invent, to test. Kazan became the birthplace and alma mater of German armored divisions. The best Panzer generals of the *Wehrmacht Heer* (the German army) were bred and trained there. In Kazan they mastered the art of modern warfare; later, they led tank units to Warsaw, Paris, Belgrade, and Athens, to the shores of the English Channel, the Adriatic Sea, and the Atlantic Ocean.

It is critically important that engineers constantly work on improving weapons. A break of even ten years carries irreversible consequences. Old engineers and designers either leave for other branches of industry or retire, without passing their experience and knowledge to the new generation. In a few years a twofold problem arises: on the one hand, a technology lapse, on the other hand, the absence of competent and experienced engineers who could bridge this lapse. Fifteen years separate the end of World War I and Hitler's coming to power. Stalin's merit before Hitler's Germany lies in that he did not allow Germany to fall behind its enemies in technological and scientific advancement. Stalin bridged the gap between the retiring generation of engineers from the Kaiser era and the newly ascending generation of the Third Reich. Stalin's efforts secured the transfer of all amassed scientific and technological potential, knowledge, and experience from the retiring designers to the newly starting creators of military equipment and weapons.

The development and production of chemical weapons (poisonous agents such as mustard gas) were set up on the premises of the firm Bersol in Ivashchenko (now Chapaevsk) near the Soviet city of Samara. The daily output of mustard gas, which sadly earned its fame during World War I, reached 3.3 tons, and the daily output of the deadly poisonous gas phosgene was 2.6 tons. That made a total of 5.9 tons per day, which meant over two thousand tons per year. Joint testing of chemical weapons was conducted on two training ranges: one called "Tomka," near the city of Volsk in the Saratov region, and another, "Podosinki," which is today Kuzminki, a district of Moscow. It was there that in 1926–1927 the first joint Soviet-German chemical weapon tests were conducted.

It was not enough to train personnel and perfect models of weapons. One also needs military factories that will produce these weapons. Here as well the Kremlin leaders already, at the end of the 1920s, showed full understanding, and came to the aid of the German war industry. An agreement was worked out about the creation in Russia of production facilities for the German war industry, masked as Soviet-German enterprises. The Junkers deal was the first such enterprise. In 1922 the firm began constructing metal planes and plane motors. Beginning in 1924, the factory already had begun to produce several hundred planes per year. Following Junkers were Friedrich Krupp (cannons, shells, and tanks), BMW (tank motors and plane motors), Bersol (poisonous gases), Karl Walther (rifles), and others.

Stalin prepared Germany for a second world war. Without Stalin's help, Germany could not arm itself and destroy Europe. Obviously, when arming Germany, Stalin was not planning that all this would be used against him.

Why Did Stalin Like Hitler's Book So Much?

Germany's most evil enemy is and will always be France.

—ADOLF HITLER, *MEIN KAMPF*

A study of the war between Germany and the Soviet Union should start with the question: Why did Hitler invade? In 1924 Hitler wrote in his book *Mein Kampf*: “We want to return to that point, where our previous development halted six hundred years ago. We want to halt Germany’s constant efforts to expand to the south and west, and have our sights set towards the territories situated to the east.” This phrase became famous and has been quoted time after time. Politicians, diplomats, generals, historians, and journalists have tirelessly repeated these words. Even in the 1920s this quote was cited in the essays and public speeches of Soviet leaders. Trotsky, Bukharin, Zinoviev, and Kamenev repeated it. In the 1930s, especially after the Nazis came to power, Hitler’s frankness resounded with new authority. Any public speaker on the impending war began with this proclamation by Hitler.

After Stalin’s death in 1953, hordes of historians quoted Hitler and accused Stalin of short-sightedness. The Fuehrer openly declared his intentions. Stalin should have read *Mein Kampf* and taken appropriate measures. From the moment that *Mein Kampf* first appeared in 1925 until the moment Hitler invaded in 1941, this quote was repeated from every loud-speaker. It was shouted at factory meetings, it was used to scare the people. It was repeated by the Comintern and printed in schoolbooks. After all this, how could the German invasion have been a surprise for Stalin? Did Stalin himself read *Mein Kampf*?

Yes, he read it. Moreover, Stalin was the first foreign reader. He was its greatest scholar and fan. The first translation of *Mein Kampf* was into Russian, under Stalin’s personal orders. The book was published for the leadership of the party and the army. Marshal of the Soviet Union Konstantin Konstantinovich Rokossovsky wrote: “In our time we all read Hitler’s book *Mein Kampf*.”¹ The translation was completed without obtaining the author’s permission. But his royalties were paid, though not right away. At the moment *Mein Kampf* was published,

Stalin was not the only leader—there was a whole crowd of leaders in the Kremlin. Not all of them understood the meaning of Hitler's creation. Comrade Stalin, however, immediately grasped, weighed, and evaluated everything. After having strangled his competition, Stalin paid his due to the author of *Mein Kampf*.

The number of copies printed in Russian at that time is unknown to me. One thing is clear: the circulation was minimal. For those few copies of the precious book, Stalin paid generously. How much did he pay? Stalin gave Hitler power over Germany. "Without Stalin, there would have been no Hitler, there would have been no Gestapo"—so said Trotsky in October 1936 as he evaluated Stalin's aid to Hitler.² Without Stalin's help, Hitler could not have come to power. Yet even such an incredible fee seemed too little to the generous Stalin. On August 23, 1939, he presented Hitler with Poland, and the rest of Europe. If Stalin had not appreciated *Mein Kampf*, the political career of Adolf Hitler would have ended in 1933 with a crushing defeat in the elections.

Let us clarify the situation in the mid-1920s when Hitler's book first came to light. Stalin sat in the Kremlin; Adolf Hitler sat in the Munich brewery Hoffbrauhaus. Stalin was one of the leaders of the Soviet Union, he was first among equals. But already many people had experienced the stranglehold of Stalin's grasping hands.

Who was Hitler in 1925? He was a failed artist, a wounded soldier returned from the front. Hitler joined a small proletarian party, which marched under the slogan of Gottfried Feder, calling for world revolution with the words "Proletariat of all nations, unite!" This program was adopted by Hitler as the foundation for a movement that he soon came to lead. Hitler's party set before itself Communist goals: banning private ownership of land, putting workers in control of administration in factories, and nationalizing industry.

On November 8, 1923, a socialist revolution hit Germany. The revolution was organized by the Comintern, and carefully directed behind the scenes by Soviet intelligence officers and envoys from Moscow. Although the revolution failed, Hitler's socialist workers' party showed itself as a unified, though small, formation of German workers. Hitler personally led his comrades into police fire. Some of his followers perished; Hitler himself was wounded and landed in jail.

That is where he fell into heresy. Hitler wrote a book, in which he uttered those famous words about lands in the east. Lenin and Trotsky decided that for the sake of the happiness of people everywhere they needed to sacrifice the people of their own country, whereas Hitler decided that the opposite had to be done: for the sake of the happiness of his people, he was willing to sacrifice people of other nations. For example, conquer lands to the east for Germany, regardless of the consequences for the people inhabiting those lands.

Hitlerism could have been eliminated from the moment of its conception. Sending an idealistic murderer to Munich would not have been a difficult feat for Stalin. Nobody would have paid any attention to one socialist breaking the skull of another, a very common occurrence. How many people did Stalin eradicate? Why did he not touch Hitler? He could have easily broken Hitler's neck and burned down his brewery with all his followers inside. Stalin could also have simply not paid any attention to Hitler, and without Stalin's help, Hitlerism would have never blossomed. It would not have yielded bloody fruit. But Stalin chose a third path: multi-faceted aid to Hitler. Stalin paved the way for Hitler to come to power. Hitler's dreams about lands in the east would have remained the pipe-dreams of a Munich dreamer, if not for Stalin's gigantic help.

Stalin read *Mein Kampf* from cover to cover and figured out that the main goal Hitler set for Germany's future was not lands in the east, mentioned in only one phrase in the book, but in liberating Germany from the chains of the Versailles Treaty. Hitler made enemies within and outside Germany. Internal enemies were the Jews. Outside enemies were the French, and the Jews.

Stalin's tactic relied on doing everything with someone else's hands, eliminating one enemy with the hands of the other. "Stalin always found monkeys, who brought him nuts from the hottest fire." This was said by Robert Conquest.³ "Nobody could make his competitors knock heads like Stalin, always staying on the side and coming out superior to all." This was noted by A. Antonov-Ovseenko.⁴ To this, one must add that Stalin was the most ardent perpetrator of Lenin's mission: to "create a Communist society with the hands of our enemies."⁵

Only once we understand Stalin's methods can we understand why Stalin liked the Munich dreamer and his book so much. The answer can be found in Hitler's book, Chapter XIII: "We must take every point of the Versailles Treaty separately, and systematically make it clear to the broadest masses of the population. We must achieve an understanding among 60 million German men, women, and children, and make them feel the shame of this treaty. We must make these 60 million have a deep hatred for this treaty, so that their scorching hatred brings the will of the people together and evokes a cry in unison: GIVE US BACK OUR ARMS!"

That is precisely what Lenin dreamed of: "that someone would emerge, who would raise a struggle against the Versailles Treaty."⁶ This someone did emerge. Adolf Hitler raised a struggle against the Versailles Treaty, and against France. He demanded arms. Stalin put a sword in his hands. The link between the contents of *Mein Kampf* and Stalin's support for Hitler becomes clearer. The proclamation about lands in the east did not scare Stalin. *Mein Kampf* is against France, as can be read in Part 2, Chapter XIII: "We must understand the following to the end: Germany's most evil enemy is and will always be France." Also: "The task of the day for us is not the struggle for world hegemony. . . . France systematically tears apart our people and according to her plans strangles our independence. . . . We simultaneously hear protests and slogans against five or even ten different countries, and meanwhile forget that first of all we need to concentrate all our physical strength and mental powers to deliver a blow to the heart of our vilest enemy. . . . France will inevitably strive to make Germany into a weak and crushed nation. . . . At the current moment, our only enemy is France—that nation, which deprives us of our rightful existence."⁷ Further in the book, Hitler continues in the same spirit for many pages and chapters.

Lands in the east were not his immediate task, only a perspective for centuries to come. This opinion was adhered to not only by Hitler, but by all his immediate entourage: "Land must be taken not in Africa, but in Europe, before all in the East. This is the natural course for Germany's geopolitical development in the coming centuries."⁸ Defeating France, on the other hand, was Hitler's immediate task. Before taking lands in the east, Hitler needed to secure himself from his mortal enemy. Here is the second reason for Stalin's love of *Mein Kampf* and its author. Stalin knew that France was not only Hitler's main enemy, but it was a mortal enemy. Stalin understood that if Hitler tried to free Germany from France's economic slavery and from the Versailles Treaty, Britain would immediately interfere, because France imposed

the treaty in alliance with Britain. If Germany entered into war with Britain and France, other countries would be pulled into the conflict as well. This was just what Stalin needed.

It did not at all follow from *Mein Kampf* that Hitler would advance to the east. In *Mein Kampf* there is a mention of lands in the east, but no indication of when Germany needs to conquer those lands. Hitler simply “pointed his finger” in the direction. He even said (in Part 1, Chapter III): “The effort would have to be envisaged in terms of centuries; just as in all problems of colonization, steady perseverance is a far more important element than the output of energetic effort at the moment.” Hitler was planning to build a thousand-year Reich. Even in the famous, repeatedly quoted passage, he speaks of centuries: “We want to return to that point, at which our previous development stopped six hundred years ago.”

In order to return to that point, the Germans had to, as Hitler instructed, “halt the constant German push to the south and the west of Europe.” This, Hitler was unable to do. He was unable to do it because *Mein Kampf* contains an inherent fundamental contradiction. In order to advance east, it was necessary to stop moving west. On the other hand, in order to advance east, it was necessary to secure Germany’s safety from the mortal enemy, France, and first go west. One does not need to have Stalin’s insight—anyone can clearly understand that Hitler got confused in 1924. He set a trap for himself. He openly declared his intention to go east, making enemies out of all those to the east of him. Any German movement “towards the sun” could only go through Poland. Therefore, Poland automatically became Hitler’s enemy. And not only Poland: “lands in the east” is a very foggy concept. This declaration could have applied to anyone. If your neighbor proclaimed that he wants to rob you, would you like him? One phrase in his book transformed Hitler into a source of fear for all his eastern neighbors. This does not at all testify to his elevated mental capabilities.

It is not wise to disclose one’s political goals, if they are strictly criminal. It is not prudent to make enemies with one’s neighbors. But Hitler not only openly proclaimed his desire to advance eastward, he also declared that France was his mortal enemy. To this list he also added the Jews. Hitler’s heavy load of enemies broke the camel’s back.

The book *Mein Kampf* clearly demonstrated the arrival of a man who was going to fight against the world, the man whom the world was going to hate, the man against whom all people would rise up, the man the whole world would declare war upon. The entire world’s hatred would concentrate against Hitler and his followers. If Hitler unleashed a war, first and foremost this war would be against anyone but the Soviet Union. If Hitler unleashed a war, logic would demand the dissipation of German strength along the entire European continent, and beyond. Those who fought against Hitler would be considered saviors and liberators. This is exactly what Stalin needed. Stalin knew: if Hitler went to war against France and Britain, the question of lands in the east would fade on its own.

6

Industrialization and Collectivization

For us, Germany's "national liberation" lies not in a war with the West, but in a proletarian revolution encompassing both Central and Western Europe and uniting it with Eastern Europe as [the] Soviet United States.

—L. TROTSKY, "AGAINST NATIONAL COMMUNISM!"

In 1927, a Five Year Plan for developing industry was adapted in the Soviet Union. This began the industrialization, over-industrialization, super-industrialization. After the first, the second Five Year Plan followed, and then a third one.

We can judge the purpose of the Five Year Plans from the following fact. At the beginning of the first Plan, the Red Army had seventy-nine tanks; at the end it had over 4,538.¹ Nevertheless, the military accent was not so noticeable in the first five years. The main focus then was not on the production of arms, but on the creation of an industrial base, which later was to produce armaments.

The second Five Year Plan was a continuation of the development of the industrial base. This meant the creation of furnaces, giant electricity plants and oxygen plants, and coal ore mines. The production of arms was not yet the main objective although Stalin does not forget about it either; in the first two five-year intervals, 21,573 warplanes were produced.²

But it was the third Five Year Plan, which was scheduled to end in 1942, that had as its goal the output of hoped-for military production, in enormous quantities and of very high quality. Under Stalin, the Soviet Union truly attained grandiose achievements.

The first secret of the success: terror. Communists shut down the borders of the country; it was impossible to run away. Secret police unleashed a fight against "saboteurs." Any accident in a production line, any breakage, any lack of success was declared a result of an evil plot. The guilty (and the innocent) were imprisoned; the terms were quite lavish. Those who were named "malevolent saboteurs" were shot.

The terror had a dual effect. On the one hand, discipline improved, and any opposition was crushed. Now there was no need to fear strikes and demands for higher wages. On the

other hand, millions of people ended up in the concentration camps. This was a slave workforce. Inmates do not have to be paid at all. They can be sent anywhere. They do not need housing—a torn tent, wooden barrack that they build for themselves, or a hole in the ground that they will dig will suffice. Inmates can be almost never fed or clothed. Their lives cost nothing. They can be forced to work any number of hours in a day, without holidays. They can be executed for unfulfilled production quotas. The development of the remote regions of Siberia and the Far East would have been impossible without the multi-million-strong armies of the inmates (and the “special settlers,” in other words, those deported by force and exiled to those remote regions). The government planned in advance the number of prisoners that would be needed for the next year, and would place an advance order for the arrests with the People’s Commissariat of Internal Affairs (NKVD).

The second secret of Stalin’s industrialization success: vast resources available in the USSR. Over a thousand years of its history, Russia had amassed an enormous treasure. The country had huge gold reserves. In churches, monasteries, museums, tsarist palaces, and the homes of rich people, mind-boggling valuables were collected: icons, paintings, statues, medals, books, antique furniture, furs, and jewelry. All this was mercilessly confiscated and sold abroad. Stalin sold enormous reserves of gold, platinum, and diamonds to the outside world. In just a few years, Stalin sold all that the nation had been gathering for centuries. Stalin robbed churches and monasteries, the imperial vaults, and museums. Icons and precious books, paintings by great Renaissance masters, collections of diamonds, and the treasures of museums and libraries were all exported.

On top of all this, Russia has every sort of natural resource and in almost inexhaustible quantities. Millions of people were cutting down forests and transporting the timber to the northern ports. The timber was the base of exports. Stalin also organized gold mining on a never-before-seen scale. Among others, a group of concentration camps was formed under the name “Dal’sstroy” (the Russian abbreviation for “Far Eastern Construction Trust”). Jacques Rossi, a Frenchman, spent almost half of his life in Soviet concentration camps. He wrote a remarkable encyclopedia, now known as *The Gulag Handbook: An Encyclopedia and Dictionary of Soviet Penitentiary Institutions and Terms related to the Forced Labor Camps*. Here is how he described this group of camps:

Dal’sstroy is the most powerful and almost autonomous kingdom in the GULAG Empire. Dal’sstroy was founded in 1932–1933 on the shores of the Sea of Okhotsk, [at] the mouth of the river Kolyma. The main task was obtaining gold. Local forests, coal, and other resources were exploited only for the internal needs of Dal’sstroy. All work was done by the inmates, including the construction of villages and towns for the freely employed, construction of thousands of kilometers of roads, barracks for inmates, etc. By the early 1940s, Dal’sstroy stretched a length of 1,300 km from north to south, and 1,700 km from east to west, encompassing the western part of Kamchatka and eastern Yakutia. Dal’sstroy was not subordinate to the local administration.³

Starting in the late 1930s and all the way into the beginning of the 1950s, several hundred thousand inmates were mining up to 100 tons of gold a year for Stalin.⁴ In 1939, just Dal’sstroy by itself mined 66.7 tons of gold on Kolyma. The plan for 1940 was for 80 tons of gold. And the production of gold kept on growing. For comparison’s sake: In tsarist Russia,

the maximum production of gold was 64 tons, in 1913; average annual gold production in the world in 1930–39 was 803 tons. Therefore, just the Kolyma camps were providing Stalin with 12 percent of the world's gold production.⁵

Siberian and Far East gold was the golden key to the success of industrialization. But Dal'stroy was not the only place where gold was mined. Stalin also paid for foreign technology with coal, nickel, manganese, petroleum, cotton, and also with lumber, caviar, and furs. In 1930, the main Soviet export became grain. They managed to get 883 million gold rubles for the exported grain. The sales of oil and oil products and also timber and timber products produced another 430 million gold rubles. Capitalists paid almost 500 million gold rubles for flax and furs.

Later on, because of grain overproduction in the United States, world grain prices dropped. In 1932–33, the overall revenue from grain sales, at very low “dumping” prices, was only 369 million gold rubles. In 1933, the revenue from grain sales was only 8 percent of overall export revenues. Even half of the grain sold during 1932–33 would have been enough to save all of the country's regions from starvation.⁶

Millions of slaves of communism fulfilled the first Five Year Plan, while at the same time the United States experienced an unprecedented economic crisis, which spread to Europe. The crisis gave additional impulse to Stalin's buildup. Finding themselves in the midst of the Great Depression, inventors and businessmen in America, Germany, Great Britain, and France sold technology at low prices. Fortunately, Stalin had plenty of gold in reserve. Western technology was the main key to success. In the beginning of the 1930s, the USSR became the world's biggest importer of machinery and equipment. The People's Commissar of Heavy Industry, Sergo Ordzhonikidze, declared with satisfaction: “Our plants, our mines, our factories are now equipped with such outstanding technology that no other country has. . . . Where did we get it from? We bought from the Americans, from the Germans, from the French, from the British the most advanced technological achievement and then outfitted our enterprises.” And then he added, with a dig: “They, themselves, still have their plants and mines equipped with nineteenth- and early twentieth-century equipment.”⁷

American engineers traveled to the Soviet Union and designed factories, while Stalin's slaves dug pits, poured concrete roads, and erected walls. Right away, cranes, tools, and equipment came from abroad, and the foreign engineers mounted, set, and tested all this. In the early 1930s, to the amazement of the entire world, in the city of Nizhny Tagil sprang up the most powerful industrial enterprise in the world—Uralvagonzavod (the Ural Railroad Car Factory).

Americans talk with deserved pride of the giant factory which they designed and built not in America, but in the Soviet Union. During the course of six decades, until the very crumbling of the Soviet Union, Uralvagonzavod remained the largest enterprise in the world (the Guinness book of world records confirms this). Uralvagonzavod was built in such a manner that it could at any moment switch from producing railroad cars to producing tanks. In 1941, an order was issued to produce tanks, and Uralvagonzavod without any delays began mass production. During four years of war, Uralvagonzavod produced 35,000 T-34 tanks. It also produced other weapons.

The Chelyabinsk tractor factory was also built in the Urals at the same time. It also was built according to American designs and fully outfitted with American equipment, and it also was built in such a way that at any moment it could stop producing tractors and instead begin

producing tanks. During the course of the war, this factory was called Tankograd. It built not only the medium T-34 tanks, but also the heavy IS and KV classes.

Not far away, in Sverdlovsk, a third gigantic factory was built—Uralsmash. This factory is among the top ten engineering factories in the world. In order to supply these giants in the Urals, the net of steel-casting factories was greatly expanded. A city of metallurgists—Magnitogorsk—was built, as well as a huge plant, the main output of which was steel armor.

The Urals were not at all the only center of tank building. In Stalingrad, a tractor factory was built, which also on the surface was designed for producing tractors but in reality was for producing tanks. At the same time, automobile, motor, aviation, and artillery factories were being erected. The most powerful aviation factory in the world was built in the Far East. In order to service the factory, the city Komsomolsk-na-Amure was built. This city was a complement to the factory. Both the factory and the city were built according to American designs and furnished with the most modern American equipment. The scope of construction in Komsomolsk astounded even the American engineers, who were there to install the equipment.

Modern factories were built in the Soviet Union, but the lives of the people were not at all improving as a result. The most ordinary pots and pans, rubber boots, plates, the simplest furniture, cheapest clothing, nails, and matches—all these became scarce. Huge lines formed outside the stores. Stalin was paying for industrialization with his people's standard of living, letting it drop very low.

Stalin had one more ace: spies. The West supplied Stalin with the most contemporary industrial equipment, and sold licenses for production of the newest models of weapons and military technology. But all that could not be obtained by legal means was stolen by Stalin's spies. Stalin was generous with his gold when it came to spying.

In order to raise the productivity of his scientists and engineers, Stalin imprisoned entire collectives of engineers, accusing them of being spies. Prominent aviation, tank, and artillery engineers found themselves behind bars. Among them was S. O. Korolev—the future inventor of the first artificial satellite to orbit Earth, N. N. Polikarpov, A. N. Tupolev, R. L. Bartini, V. M. Myasishev, V. M. Petlyakov, and thousands of others. The task set before them was simple: create the best bomber (tank, cannon, engine, and submarine) in the world and you will receive freedom; fail and you will go to Dal'stroy to extract gold; the inmates there do not live too long. Imprisoned engineers did not have to be paid millions for their work, they did not need good houses or apartments, and there was no need to send them to resorts by the warm sea: without all this, they were still very interested in creating the best weapons in the world on very short deadlines. These were talented people; on top of talent, Stalin's spies supplied everything that was created by the best minds in the world. Every imprisoned engineer had before him the best American, German, British, and other designs in the given field. He could choose the best, and based on it create something even more remarkable.

Immediately after the Communists seized power, the land was divided among the peasants. Land was divided rather fairly—according to the number of mouths to feed, meaning the size of area a family received depended on the number of its members. Millions of Russian peasants dreamed for centuries of receiving land. Now their dreams had finally come true, but resulted in a widespread famine across the land. The cause for this was that the Communists gave people the land, but demanded everything the peasants could grow to be given back to the government. The land is yours, but all that you can grow on it is not yours.

It is understandable that nobody wanted to voluntarily give up the fruits of his labor. In answer to this, Communists created “food regulation” brigades and entire armies—units of armed men who took away from the peasants all their reserves. The peasants answered with armed resistance, but they failed.

In the struggle for bread the Communists won, but they celebrated their victory too soon. It is possible to take away from the peasant all his bread, his potatoes, to lead away his cows and to slaughter his pigs; however, it is impossible to force a man to continue working hard. The Russian peasants stopped growing agricultural products since the Communists were taking away what they produced. This resulted in the horrible famine of 1920–21.

Lenin was forced to retreat from his rigid politics. Free trade of foodstuffs was allowed; the gold ruble was introduced. All this was called by the term NEP—New Economic Policy. There was nothing new in it. It was good old capitalism. The country was revived almost immediately. By 1923, there was so much produce that Russia was once again able to export grain. Then, in 1927, Stalin began his industrialization. This process brought on consequences that were not foreseen by the Communists. The country had huge reserves of produce, but peasants were in no rush to sell them. The reason was simple: over several years, hardworking peasants had hoarded significant reserves of gold rubles. They went to the shops in search of manufactured products, but there was nothing to buy. Practically all industrial production in the Soviet Union focused on the military. There were tanks, airplanes, parachutes, cannons, shells, cartridges, and machine guns, but no home appliances. What does a man need cash for, if there is nothing to buy? The peasants once again either stopped selling products or stopped producing them.

The Communists now faced a dilemma: either direct a part of production to producing goods for the wealthy peasants to consume or get rid of the wealthiest, meaning the most hardworking, the smartest. Rather than return to normal human existence and end communism, Stalin chose to enslave the peasants on collective farms and eliminate private ownership. In 1928, Stalin began the bloody war against peasants, which was called collectivization.

Units of the Red Army encircled entire regions. Those peasants who produced more than others were, in the middle of winter, herded together with their families into railroad cattle cars and transported across thousands of kilometers to Siberia, the Urals, or Kazakhstan, where they were thrown out into the cold on the bare steppes. This grandiose operation was initiated on Stalin’s orders and executed by his rising deputy Molotov. Many years later, Molotov was asked how many people were transported to the wild, uninhabited regions during collectivization. He answered: “Stalin said that we relocated ten million. In reality, we relocated twenty million.”⁸

Historical literature and documentary sources offer different numbers of the demographic losses resulting from the collectivization and starvation of 1932–33. Presently, the following figures look most justified: 3.5 to 5 million people perished from famine, and about 3 to 4 million people died at the places of exile as a result of intolerable conditions of repression and unbearable life. Cannibalism flourished in the country. Stalin, meanwhile, during these horrible times was selling millions of tons of grain each year to accumulate currency in order to produce weapons in mass quantities.⁹

7

Stalin's Role in Elevating Hitler

If Russia makes peace, this peace will only be temporary. The Socialist Revolution in Russia will only win when it is surrounded by a ring of sister Socialist republics. A peace made with imperialist Germany would only be an episodic phenomenon. It will provide a short break, after which war will boil once again.

—G. ZINOVIEV, *COLLECTED WORKS*

The year 1927 was when Stalin finally secured and firmly established his place atop the power structure. From this moment, Stalin's attention was concentrated not only on fortifying his dictatorship, but on issues of the Communist movement and the World Revolution. Stalin needed victory in Europe, especially in Germany. For this, he needed to eliminate three obstacles that were preventing the German revolution. Stalin had to bring order to the German Communist Party and force it to execute orders coming from Moscow, establish common borders with Germany, and destroy the German Social Democrats.

Stalin understood better than anyone else that revolution comes as a result of war. War heightens tensions, ruins economies, and brings nations closer to the fateful limits, beyond which their ordinary existence ceases to be. In matters of war and peace, he adhered to this principle: if the Social Democrats, with their pacifism, divert the proletariat's attention from revolution and from war that gives birth to revolution, then merciless war must be waged against the Social Democrats. On November 6, 1927, Stalin sounded the slogan: "It is impossible to finish off capitalism without finishing off the Social Democrats."¹ In the following year, Stalin declared war on Social Democrats to be the main task before the Communists: "First of all, a tireless struggle against Social Democrats on all lines . . . including exposure of bourgeois pacifism."² Regarding those who wanted war, for example regarding the "German fascists" (Communists did not call them "Nazis" because they did not want their people to know about the "socialist" and "worker" aspects of the name of Hitler's party), Stalin's position was clear and rigid: they must be supported. Let the fascists take care of the pacifists and Social Democrats; let them start a new war. Everyone knows that what follows a big war is revolution.

In 1927 Stalin foresaw the Nazi takeover in Germany, and considered this development desirable: "Precisely the fact that the capitalist government is turning fascist is leading to a heightening of tensions within the capitalist countries, and to revolutionary actions by workers," Stalin told the Central Committee in 1927.³ Stalin gave Hitler's regime the name "terrorist dictatorship" and stressed that "the revolutionary crisis will increase faster [since] the more the bourgeoisie gets confused in its combinations and tactics, the more it employs terrorist methods." In his report to the Seventeenth Party Congress, he stressed: "I speak not about fascism in general, but about fascism of the German type."

In 1925, Stalin declared that World War II was inevitable, as was the Soviet Union's entrance into that war. "There can be no doubt that a war in Europe will start and they will all fight in it."⁴ But Stalin did not want to start the war himself, or to be its participant from the first day: "We will have to enter, but we will enter last, we will enter in order to throw in our weight and tip the scale."⁵ The more crimes Hitler committed in Europe, the better for Stalin, the more reasons Stalin had to send the Red Army to liberate Europe.

For Stalin's strategy to be implemented Hitler needed to secure an absolute majority of the votes in the German parliamentary elections. He could not do this alone. On July 31, 1932, Hitler's party amassed 13.7 million votes in the elections to the *Reichstag* (German parliament), 37.3 percent of the total number of votes—the peak for the Nazi party, after which its popularity began to decline. However, this was not enough for an absolute majority. In the following four months, Hitler lost 2 million votes. The decline continued, and gained momentum. The breakdown of the votes for the major German political parties on November 6, 1932, when the emergency *Reichstag* election took place, was as follows:

Hitler's party (NSDAP)—11,705,000
 Social Democrats—7,231,000
 Communist Party—5,971,000

Hitler's National Socialist Workers' Party faced a crisis. At first glance, Hitler seemed to be the winner and the most popular politician in Germany, and therefore should have taken power. However, he did not have an absolute majority, and could not take power. But combined, the Social Democrats and the Communists had more votes. Hitler's National Socialist Workers' Party was in a deep financial crisis as well, its funds diminishing fast. Goebbels wrote in his diary: "All hope has disappeared. . . . There is not a pfennig in our cash boxes. . . . Nobody gives us any credit. . . . We are on our last breath." Goebbels's entry on December 23, 1932, said: "I am overwhelmed by a terrible feeling of loneliness, which borders on a sense of total loss! The year 1932 was a sequence of one misfortune after another. It should be erased completely. . . . We have no prospects, no hopes left." The terrible position the Nazis found themselves in was no secret to outside observers. By New Year's Eve, the powerful newspaper *Frankfurter Zeitung* was already rejoicing at the "disintegration of the NSDAP myth." Harold Laski, one of the leading intellectuals of the English left, was assured that: "The day when the National Socialists presented a lethal danger has passed. . . . If we discount chance, it is not so improbable that Hitler will finish his career as an old man in some Bavarian village, telling tales to his friends in the evenings in some beer hall, about how he once almost orchestrated a takeover in the German Reich."⁶

Facing bankruptcy, Hitler, as recorded in Goebbels's diary, considered two options: the first was flight, the other was suicide. Ten years after the crisis, Hitler himself told his inner circle: "The situation was at its worst in 1932, when we were forced to sign many debt obligations in order to fund our press and election campaigns, and keep the party running. . . . In the name of the NSDAP, I signed for these obligations, knowing that if the NSDAP stopped functioning, everything was lost."⁷ At the end of 1932, Hitler's time would be up, and he would be finished as a politician. For the time being he was still the most popular political figure in Germany, but his party was in deep debt, and running out of money. German National Socialism faced doom until Hitler was saved by Stalin.

Comrade Stalin did not just save Hitler; he handed him the keys to power. Democracy is structured in such a way that, during the turning points of history, minority groups play the key roles. This occurs because history has innumerable possible courses and outcomes. When everything goes well, people agree with the leaders' course of action, but during times of crisis alternative ideas and plans arise. Policy alternatives split the nation almost evenly between two diametrically opposed views. In such a situation, a third party—a minority—becomes the kingmaker, and its role can be decisive.

In 1932 Germany experienced precisely this situation: Hitler was in first place, the Social Democrats second, and the Communists third. But none of the three could control the absolute majority needed to come to power. In this case, Germany's fate, and the fate of Europe, was in the hands of the German Communists. If the Communists sided with the Social Democrats, Nazism would perish and never again resurface. If the Communists turned against the Social Democrats, Social Democracy would crumble.

For the Communists, forming a coalition with the Social Democrats meant defeating Hitler. After this victory, the Communists would automatically rise from third place to second, and share power with the first-place party, the Social Democrats—a very appealing option.

The Communists had a second option: to go against the Social Democrats, thereby opening the way for Hitler to take power. The consequences of such a move were very predictable: Hitler, having come to power, would throw both Social Democrats and Communists into concentration camps. If the German Communists went against the Social Democrats, they would be sentencing to death both themselves and the Social Democrats.

Acting on Stalin's orders, the German Communist leaders chose the second option—they did not wish to form a block with the Social Democrats. Publicly, for regular Communists and workers, the Communist Party policy against the Social Democrats was explained with twisted reasoning: there is no radical difference between a regime of parliamentary democracy and a fascist dictatorship. Both are forms of dictatorship by the bourgeoisie, which was growing more and more reactionary. The German Communist leaders kept repeating, after their Moscow masters, that a fascist-like turn taken by the bourgeois parties and their Social Democrat supporters was even more dangerous than the Nazis because the Social Democrats hid their true motives. German Communist leaders told the workers: We are Communists, struggling against capitalism and fascism, while the Social Democrats are acting as protectors of capitalism, and are becoming *de facto* allies of the fascists. Therefore, the Social Democrats are really nothing more than a "left wing" of fascism, or they are "social fascists," a party which conducts a policy of "hidden fascism" that is more dangerous than Nazi policy. The peace-loving policy of the Social Democrats prevents war; therefore it prevents revolution

and, ultimately, prevents the victory of the Working Class, while the Nazi policy enhances the chances for war and revolution and, ultimately, the victory of the Working Class. From this bizarre dialectic, they concluded that Hitler's party must carry out the main attack on the Social Democrats, since they were the most dangerous enemy, which still retained some influence over the worker class and hindered an effective war on capitalism.

Hitler came to power as a result of this perverted ideological mind game. German Communists, out of instincts for self-preservation, should have joined a coalition with the Social Democrats. But Stalin intervened and opened the way for Hitler. The first time there was open cooperation between the Nazis and Communists was in August 1931 in Eastern Prussia, where the Social Democrats were in power. The Nazis initiated a referendum to oust the Social Democrats. At first the Communists were opposed to the referendum. However, after instructions from Moscow, they changed their minds. The Nazis and Communists joined forces under a common red flag, on which the swastika and the hammer and sickle were intertwined. Despite the Communists' calling the plebiscite a "Red Referendum" and the Nazis "working people's comrades," the referendum failed to gain a majority.

A year later, several days before the November 1932 elections for the *Reichstag*, a public transportation strike began in Berlin. The Communists and Nazis jointly coordinated the strike. Storm troopers and *rotfronters* (Communist paramilitary) paralyzed public transportation for five days, dug up tram tracks, picketed, beat up those who came to work, and used force to stop the cars that the authorities managed to put to work.

Once the Nazis came to power, Stalin used all his might to push them toward war. When Germany attacked Poland, and France and Britain entered the war against Germany, Stalin ordered the Communists of the Western democracies to oppose the war. The Western democracies were branded as capitalist imperialists, and the Comintern ordered its members to weaken the armies of the Western democracies through strikes in armament and airplane factories. The Communist Parties were to demand an end to the "imperialist war." Hitler was portrayed as a fighter for the working classes. But by pushing Hitler into conflict with democratic Europe, Stalin had issued Hitler a death sentence. By offering to divide Poland with Hitler, Stalin had dragged him into a larger scale war with no end in sight. Stalin expected that the Western allies and Germany would exhaust their strength by fighting against each other as they did in World War I. The struggle between Hitler and the Western democracies would create the moment for a "mighty strike" from the East and bring forth world revolution on the bayonets of the Red Army. Five years prior to the Nazis' rise to power in Germany, Stalin had already planned their annihilation: "[We will] crush fascism, destroy capitalism, establish Soviet power, and liberate the colonies from slavery."⁸

Stalin and the Destruction of Soviet Strategic Aviation

Given the existence of a massive invasion army, the main task of the air force is to support the advancement of this army, for which all forces must be concentrated.

—BRIGADE COMMANDER ALEXANDER LAPCHINSKY, *THE AIR ARMY*

Stalin could have averted World War II with one stroke of his pen. He had many such opportunities. Here is one of them: In 1936, the Soviet Union developed the heavy high-speed, high-altitude bomber TB-7 (later renamed Pe-8). Here are reviews of it:

Air Force Major General P. Stefanovsky, test-pilot of the TB-7: “The multi-ton ship surpassed in its flight capabilities at an altitude of ten kilometers all the best European fighters of its time.”¹

Air Force Major General V. Shumikhin: “At altitudes above 10,000 meters the TB-7 could not be reached by the majority of existing fighters at that time, and the ceiling of 12,000 meters made it untouchable even by anti-aircraft artillery.”²

Airplane designer V. Shavrov: “A remarkable airplane. It was on the TB-7 that the first five-ton bombs were lifted, earlier than in the United States or in England.”³

Professor L. Kerber: “This machine had a strong defense system consisting of 20-mm cannons and 12.7-mm heavy machine guns. Bombs of the largest caliber could fit in the large bomb compartment. . . . [It was] unreachable at maximum altitude of its flight by anti-aircraft cannons and fighters of that time. The TB-7 was the most powerful bomber in the world.”⁴ “A record-setting plane. . . . Now, we have every reason to assert that the TB-7 was more powerful than the American flying fortress B-17.”⁵

Historians agree with such appraisals. John V. R. Taylor: “At heights of 26,250 to 29,500 feet its speed surpassed the speed of German Me-109 and He-112 fighters.”⁶ Vaclav Nemecek: “This machine had an incredibly long life. In the fifties, one could still encounter [some of] these planes on polar routes, where they were used for transporting cargo.”⁷ There is no need to prove that only good planes live and fly for such a long time.

The remarkable qualities of the TB-7 were demonstrated to Western experts in the spring of 1942, when the arrival of a Soviet delegation headed by Molotov was awaited in the

United States and in Britain. It was thought that the only possible route was through Siberia and Alaska. But Molotov flew on a TB-7 from Moscow to Britain over occupied Europe. One must remember who ruled the skies above Europe in the spring of 1942, in order to appraise the level of trust of Soviet leadership in this airplane. Molotov did not fear landing on the defendant's bench in Nazi court, and Stalin did not fear letting Molotov fly. The TB-7 proved itself. It flew over all of Europe, stopped in Britain, flew to America, and returned by the same route, once again flying over German holdings undisturbed.

After the war, a commission of the Soviet government conducted an analysis of the German anti-aircraft defenses at the time of Molotov's flight. It turned out that, along the flight path, German fighters did not go up to intercept the enemy aircraft, there was no alert sounded at the anti-aircraft batteries, the observation posts did not register the flight of the TB-7 at all. Simply put, the German anti-aircraft defenses not only could not take down the TB-7, they could not detect its presence in their air territory.

Colonel (at that time, Captain) E. Pussep, who flew a TB-7 over Germany many times (not only with Molotov's precious self, but with other cargo), recounted: "The anti-aircraft guns reach at such altitudes with hardly any aim, if at all. A fighter plane at such height can act only like a sleepy fly. Who can do anything to me?"⁸

So, long before the war the Soviet Union had created an untouchable bomber, and a government order was prepared to produce a thousand TB-7s by November 1940. What remained to be done? All that was left to do was to sign the order with seven letters: J. STALIN.⁹

When the first TB-7s flew at unreachable altitudes, engineers in other countries of the world still had problems with the unseen barrier of height: in thin air, engines lost their power from a deficiency of oxygen.¹⁰ They literally suffocated, like mountaineers at the summit of Mount Everest. One possible way of increasing the power of engines existed: to use exhaust gases to rotate a turbo-compressor, which supplies the engine with additional air. This was simple in theory, difficult in practice. In experimental trials, in record-setting airplanes, this was successful. But in series models, it was not.

Components of the turbo-compressor work in a hot stream of corrosive gas at a temperature of over 1000 degrees Celsius when the surrounding air is minus 60 degrees Celsius, and then return to the warm ground. Uneven heating and rapid changes in pressure and temperature ruined the parts, and the sound of the turbo-compressor drowned out the roar of the engines. Protective paints and coatings burned during the first flight and, when back on the ground, moisture settled on cooling engines, and corrosion ate through the mechanisms. The bearings had the worst fate: they melted, like wax candles. On a trial plane, if out of ten attempts one time the turbo-compressor doesn't break, good. But what is one to do with the mass production airplanes?

Everyone searched for the solution, but it was discovered by Vladimir Petliakov, the creator of the TB-7. Petliakov's solution was kept as a top government secret. The TB-7 had four propellers, and from the outside appeared to be a four-engine plane. But inside its body, behind the crew cabin, Petliakov installed an additional fifth engine, which did not rotate any propellers. At low and medium altitudes, the four main engines were engaged, and at high altitudes, the fifth was switched on and brought into action the system of a centralized supply of additional oxygen. Using this oxygen, the fifth engine fed itself and the four others. That is how the TB-7 could climb where no other plane could reach it. With it, one could fly over Europe, bomb any object, and not worry about its own safety.

With a thousand untouchable TB-7s, any invasion could have been averted. All that had to be done was to invite delegations of certain countries and in their presence somewhere in a remote steppe drop at least one thousand tons of bombs from astounding altitudes.¹¹ Then follow up with an explanation: This has nothing to do with you, this is a surprise we hold for the capital city of that country which ventures to attack ours. Precision? There is no precision. Why would there be? We drop the bombs from incredible heights. The lack of precision will be corrected through repeated drops. Every day several hundred tons will rain on the capital of the aggressor, until we reach the desired outcome, and then other cities will get a taste of this hailstorm as well. Do you understand what will happen to the opponent before he has a chance to reach Moscow? The TB-7 is untouchable when in the air, and cannot be attacked by the opponent on land: our bases are hidden far from the borders, and our probable enemies have no strategic aviation to speak of. . . . And now, gentlemen, let us drink to eternal peace.

Such a speech could have been given by Stalin's diplomats, if the Soviet Union had several hundred or even a thousand TB-7s. But Stalin decided not to build a thousand TB-7s. Is it possible to understand Stalin's motives? Yes, it is possible.

If we compare a thousand TB-7s to a game of chess, this situation is the equivalent of being able to declare checkmate to the opponent's king before the start of the game, and if the partner still ventures to play, one can call checkmate after his first move. If one thousand tons of bombs, which several hundred TB-7s could deliver in one trip, are to be translated into contemporary strategic terms, it is equivalent to one kiloton. This is the language of the nuclear age. If one kiloton is insufficient, in two sorties twice this amount can be delivered. Twenty kilotons equals what (without much precision) was dropped on Hiroshima. A thousand TB-7s is like a nuclear missile, aimed at the enemy's capital. The power is such that, for a potential aggressor, war loses all sense.

Some argue that during the course of the war the British and American strategic aviation dropped many more bombs on Germany, without being able to bomb her into surrender. This is true. However, these were bomb raids during the course of the war, when it was too late for Hitler to ask for mercy. A different story would have been to demonstrate such power to Hitler and his generals before the war, and warn them that if they started a war all this would fall on their heads. In that case, Hitler personally, or those surrounding him, would have thought twice about the consequences of their actions.

In the late 1930s Stalin had the capacity to create an instrument that would serve as a severe warning to Hitler. With one stroke of Stalin's pen on an order to produce a series of TB-7s, the German invasion of Soviet territory could have been averted. Of course, in August 1939 Stalin could not have had a thousand TB-7s. But he could have had two, three, four, or maybe even five hundred. If only Stalin had in due time signed an order for the serial production of the TB-7.

To do him justice, it must be noted that Stalin did sign such an order—but then he canceled it. And signed it again! And repealed it again, and again. Four times the production of TB-7s started, and four times it was canceled.¹² After each order, the industry had time to put out three or four TB-7s, and then the order was reversed. Everything started anew, and once again was interrupted. By June 22, 1941, the TB-7 series was not in production. In the four attempts, the aviation industry had time to issue and give over to the air force not a thousand TB-7s, but only eleven. Moreover, almost all of the eleven planes lacked the most

important detail—the fifth additional engine.¹³ Without it, the best strategic bomber of the world became an average commodity. After Hitler's invasion, the TB-7 series was resumed in production. But by then it was too late.

A question arises: If Stalin had issued the order to produce a thousand TB-7s and did not cancel it, could the Soviet industry have fulfilled such an order? Could it have put out, by the end of 1940, a thousand such airplanes? The creator of the TB-7, Vladimir Petliakov (after Petliakov's tragic death the TB-7 was renamed Pe-8), did not doubt this for a minute. Alexander Mikulin, creator of the engines for the TB-7, was completely certain that Soviet industry could meet such a demand. Professor L. Kerber, the deputy to the airplane designer A. Tupolev, and experts in the air industry S. Eger, S. Leshchenko, E. Stoman, chief engineer of the factory that produced the TB-7s I. Nezval, head technologist of the factory E. Shekunov, and many others on whom production of the TB-7 depended—all thought the task could be accomplished by the designated deadline. Airplane designers V. Shavrov and A. Tupolev held that one thousand TB-7s could be ready by November 1940.

The confidence of the engineers and leaders of industry is understandable: the TB-7 was not being built just anywhere. Russia is the motherland of strategic bombers. I say this with pride and without irony. At the beginning of the twentieth century, when the entire world was flying on single-engine planes, Russia was the first in the world to start producing twin-engine airplanes. The world did not have the time to fully appreciate this advancement, when the great Russian engineer Igor Ivanovich Sikorsky built the first four-engine heavy bomber Ilya Murometz in 1913. The Murometz was unrivaled in terms of armament, bomb capacity, and range for several years. It had the best navigation system, bomb-aiming sight, and the first electrical bomb release mechanism in the world. For defense, it had eight machine guns, and there had even been an attempt to install a 76-mm cannon on board. In 1914, Russia became the first country in the world to create a unit of heavy bombers—a squadron of air ships.

When the Communists took over the country, Igor Sikorsky found himself among the exiles. However, Russia's technological potential remained large, and development continued. Despite the terror, despite the Communist burden, Russia continued to be the leader in the area of heavy bombers. In 1925, the design bureau of A. Tupolev created the TB-1, the first entirely metal bomber in the world, also the first monoplane with a cantilever wing. The rest of the world at the time still built wooden biplane bombers. The test trials of the TB-1 yielded two world records. In a short time, 216 TB-1s were built—another record.¹⁴ Russia had more heavy bombers than all the other nations combined. As the planes were built, more and more squadrons, regiments, and brigades were formed.

In 1930, Tupolev put out an even more powerful bomber—the TB-3, the first four-engine monoplane with a cantilever wing. The TB-3 was the largest of all airplanes in the world, both military and passenger. Such planes were unseen not only in production, but even in blueprints. Tupolev, in 1933, had already begun experimenting with refueling the TB-3 while in flight. The TB-3 set several world records, including high altitude flights with cargos of 5, 10, and 12 tons. The design of the TB-3 became a basic model for this class of airplane for many decades to come. The plane was assembled with astonishing speed, which reached three TB-3 models per day.¹⁵

Soviet industry broke its own records—in a short period it put out 819 TB-3s. Air regiments and brigades were no longer enough. On March 23, 1932, the Soviet Union be-

came the first country in the world to create a heavy bomber corps. In January 1936, the first aviation army was created, a second army in March, and a third aviation army a bit later. No other nation at the time had either an aviation army or even a corps of strategic aviation. A fleet of a thousand heavy bombers is a strategist's dream, and this dream materialized first in the Soviet Union. Generals and politicians of all nations disputed the doctrine of the Italian air power theorist General Giulio Douhet, a strong proponent of strategic bombing.¹⁶ Only Stalin did not argue.

But that is not all: the plans were for rearming three aviation armies with the newest bombers and additionally deploying three more armies in the Byelorussia, Kiev, and Leningrad military districts.¹⁷ While the TB-3 was "learning to fly," while it was being "put on its wings," approximately ten design bureaus were already engaged in fierce competition to receive the order for the newest strategic bomber, which would come to replace one thousand of Tupolev's TB-1s and TB-3s. Tupolev himself proposed the eight-engine Maxim Gorky. Only one model was built as a show piece to be flown over parades, awing the crowds with its dimensions. Maxim Gorky crashed in 1935, after a mid-air collision with a small escort plane. Thirty-seven people—the passengers and crew of both aircraft—died. A conspiracy theory has arisen alleging that the pilot of the escort plane deliberately rammed the Maxim Gorky because he believed Stalin was aboard.

Pavel Sukhoi proposed a one-motor long-distance bomber, the DB-1, with an incredibly large wingspan. The DB stands for *Dal'nyi Bombardirovshik*, which means "long-distance bomber." This plane (under a different name) completed several flights across the North Pole to America. America greeted Soviet pilots as heroes, not understanding that they were running tests of an experimental bomber. Sergei Kozlov proposed a twelve-motor "Ghigant" (Giant), capable of lifting several tens of tons of bombs, and of delivering to the enemy's rear paratroop divisions complete with any heavy artillery, including tanks.

Bolkhovitinov proposed a heavy bomber, the DB-A. Though it looked like a new airplane in design and description, it is a remodeling of the TB-3. This is a classic example of how a new airplane can be created with minimal expenditures, at the same factories that produced the old models. The DB-A broke four world records. It was the newest plane, but it could be produced by the same factories that put out the TB-3, without rebuilding the assembly lines, without changing equipment, without disrupting the established production flow, without retraining workers and engineers—in short, without the usual reduction in output and even without the need to retrain pilots, technicians, or engineers. If time was an issue, it was possible to launch a series of DB-As and fully renew the strategic aviation fleet by the start of World War II. But then a new, true miracle appeared—Petliakov's TB-7. The TB-7 eclipsed all other models.

By the time the TB-7 appeared, production of heavy bombers was as perfected in the Soviet Union as Henry Ford's production of automobiles had become in the United States. Changing a model is usually a difficult process, but it is simpler than creating a new model from scratch. During those horrible years, when millions died of hunger, the Soviet Union was first in the world in production of heavy bombers. Then, when the economy had somewhat improved, the country suddenly voluntarily backed away from its first-place position in this field. When no one threatened the nation, it took bread from dying children to continue to build heavy bombers. But when Hitler appeared nearby, and war came within sight, the production of heavy bombers was halted.

The question is not whether or not there would have been enough time to build a thousand TB-7s before the beginning of the war. The question is: why did they not try?

By the time the TB-7 came onto the scene, the Soviet Union had created design bureaus capable of creating airplanes that were ahead of their time, and an industry capable of a mass output that surpassed the demand of peacetime. Air academies, pilot schools, and technical schools were opened, the theory of military use was developed, and combat experience was obtained in local conflicts and grandiose training exercises. Air bases, learning centers, and test sites were built; personnel from command staff to machine-gun operators, from navigation officers to engineers to photo-decipherers were trained. Pilots, meteorologists, aviation medics, and others were all ready. Collectives formed, traditions were born, theorists and practitioners were raised.

After all this, the country that was the leader in the field of strategic aviation entered World War II without strategic aviation. On Stalin's orders, in November 1940, the Soviet air armies were disbanded. On June 22, 1941, Soviet strategic aviation did not have any armies in its ranks. Only five corps and three separate divisions remained. They were mostly equipped with the DB-3f, which is a magnificent bomber, but not a strategic bomber. They also still had TB-3s, which could be used to transport cargo, but as bombers they were obsolete. As we already know, there were only eleven TB-7s, not even enough to outfit one squadron.

It seems that there was no situation in which the TB-7 would become superfluous. If Stalin planned to avert World War II, he needed the TB-7. If Stalin decided to allow Hitler to unleash the world war, and planned to himself remain neutral, the TB-7 would be very needed, as a guarantee of neutrality. If Stalin planned defensive war, troops should have been ordered to dig themselves into the ground, as was done later on near Kursk. He needed to barricade the borders with impassable minefields from sea to sea, and while the enemy would be gnawing through our defenses, let the TB-7 fly at unreachable altitudes and ruin German economic power. In a defensive war, the TB-7s were needed. Stalin's resources were unlimited, while Hitler's were limited. Therefore, if the war started, it was to Stalin's advantage to draw it out: a war of attrition was deadly for Germany. In order to exhaust the enemy's resources more quickly, Stalin needed strategic bombers to weaken the military and economic potential of the enemy. There could be no better instrument for such a task than the TB-7.

The fate of the TB-7 disproves the legend that Stalin feared Hitler. If he was afraid, why not order the TB-7? The more he feared, the more planes he should have ordered. The reader should agree with me that when at night we fear walking across a cemetery, we pick up a stick. The more we fear, the bigger the stick we pick up, and we swing it menacingly. Stalin, on the other hand, had to be coaxed into picking up a stick. His personal advisor, airplane designer Lieutenant Colonel General Alexander Yakovlev, testifies that the chief of an R&D Center of the Air Forces, Major General A. I. Philin, was not afraid to prove to Stalin, in the presence of many, the necessity of producing a series of TB-7s.

Arguing with Stalin was tantamount to suicide. "Philin demanded, a few others supported him. In the end, Stalin conceded, saying: 'OK, let it be your way, though you have not convinced me.'"¹⁸ This is one of those cases when Stalin allowed the issue of TB-7s. Soon after, Stalin changed his mind and repealed his order. Once again, some brave souls began to argue and plead with him. The question is: Why was it necessary to prove to Stalin this plane's usefulness? If we all understand the indisputable advantages of the TB-7 and the need for its production, why could not Stalin understand such simple facts? If everything boils down to

Stalin's stupidity, the TB-7 would have been forbidden with one blow, and Stalin would not have returned again and again to the question. But Stalin changed his mind eight times. Why these doubts?

Exterminate millions of the best peasants, feeders of Russia? Order given—and the murderous collectivization starts. Purge the command staff of the army? No problem. Sign a pact with Hitler? No doubts. Stalin rarely had doubts. Repealing the order to build the TB-7 was the most difficult decision Stalin made in his lifetime.

The TB-7 had powerful enemies, and it is time to name them. The General Staff of the Red Army was formed in 1935. Before the German invasion the post of Commander of the General Staff was occupied in succession by Marshals A. I. Egorov and B. M. Shaposhnikov and Generals of the Army K. A. Meretskov and G. K. Zhukov. All of them were opponents of the TB-7. Other opponents of the TB-7, and of all strategic bombers, included many important aviation generals, including P. V. Rychagov, F. K. Arzhanukhin, and F. P. Polynin. The People's Commissar for Defense Marshal S. K. Timoshenko also opposed the TB-7. Airplane designer A. S. Yakovlev, Stalin's advisor on questions of aviation, was an avid opponent. And, of course, almost all Soviet military theorists, starting with V. K. Triandaphillov, were opposed to strategic bombers.

The best of all arguments against heavy bombers was put forward by a professor, Brigade Commander Alexander Nikolaevich Lapchinsky, the leading Soviet theorist of air warfare. He wrote several brilliant works on the theory of military aviation. His ideas are simple and understandable. Bombing cities, factories, and sources and storages of strategic resources is good. But it is even better to take over all this and use it to enhance one's own might. It is possible to transform the enemy's country into a smoking heap, but is it necessary? Bombing roads and bridges is useful in any situation except one: when we are preparing an invasion into enemy territory. In that case, bridges and roads should not be bombed, but taken over intact, without allowing the retreating enemy to use or to destroy them. Bombing cities drastically lowers the morale of the local population. This is true, who would argue with such a fact? But a forceful advancement of our troops toward enemy cities demoralizes the population more than any bombing. Lapchinsky recommended to Stalin to direct all efforts of the Red Army not toward undermining the military and economic capabilities of the enemy, but toward taking them over. The Red Army's objective was to destroy the opponent's armies. The objective of Soviet aviation was to open the road to our armies and support their rapid advancement.

Lapchinsky recommended not declaring a war, but starting a war with a sudden crushing attack by Soviet aviation on enemy air bases. The suddenness and power of the strike needed to be such that in the first hours it would destroy all of the enemy's aviation, without letting it leave the ground. Having destroyed the enemy's aviation on the ground, we would open the road for tanks, and advancing tanks in their turn would "level the enemy air bases." The target for our aviation should not be city districts, not electric plants and factories, but the enemy airplanes on the ground, the hidden machine gun hindering the advancement of our infantry, the column of trucks with fuel for enemy tanks, the anti-tank cannon hiding in the bushes.

In other words, one should bomb specific targets, many of them mobile. Bombing should take place not in the enemy's rear, but in the closest tactical space, on the front lines. For such work, one needs a light, maneuverable plane, whose pilot can use it to come close

to his target, recognize it, and hit the enemy precisely without hitting his own troops. The bomber is not needed. One needs a plane that either dives from heights or comes to the target in a hedgehopping flight, barely missing the treetops.

If we plan to blow up the neighbor's house, we need a crate of dynamite. But if we plan to kill the neighbor, and take over his house, we do not need the dynamite; we need cheaper, lighter, and more precise tools. Lapchinsky recommended to Stalin a different tool: a light bomber or a low-flying attack plane. A strategic bomber flies from faraway stationary bases and covers great distances, while the Soviets needed a plane that would always be nearby, could land on any dirt airfield, could easily change bases following advancing divisions, and could immediately fulfill the requests of tankers. They needed a light plane, whose pilots could themselves see the situation and instantly react to changes, contributing to the successful outcome of a quick and decisive battle.

Vladimir Petliakov, aside from the heavy four-engine (or rather five-engine) TB-7, created another plane—a small, twin engine, fast, maneuverable dive-bomber, the Pe-2. This was exactly what Stalin needed. Stalin decided: "Build two-motor ones, as many as possible."¹⁹ Was it not possible to build heavy and light bombers simultaneously? "No," said Lapchinsky, "impossible." All resources, all efforts had to be concentrated on achieving the central goal: obtaining full air superiority through a sudden attack on enemy air bases. If such a strike was delivered, there would be no need to bomb cities and factories. Stalin allowed the production of both types of airplane for a long time, but then understood that he must choose one or the other. He made his choice.

If we cannot grasp Stalin's iron logic, it is easier to declare Stalin insane. But let us look at Hitler. He is also an aggressor, and that is why he also has no strategic aviation. Hitler prepared a lightning takeover of France, and needed to take over and safeguard bridges rather than bomb them. German tank divisions needed the bridges for quick advancement. Paris also did not need to be bombed. Paris, with all its treasures, would go to the victor. Hitler did not need to destroy the shipyards of Brest, the tank and artillery factories of Cherbourg, Chaumont, and Bourges, the airplane factories of Amsterdam and Toulouse. They would be needed to strengthen the military might of the Third Reich!

For the blitzkrieg, Hitler needed aviation, but the type that would destroy French planes on the ground and paralyze, through sudden strikes, the French system of military command, not the type that destroys cities and factories. He needed aviation that would open the way for tanks and secure the quickness of their thrust toward the ocean. He needed aviation that hovered over the battlefields, fulfilling the requests from the tankers; aviation that struck not on giant areas, but on concrete targets. For the *Blitzkrieg*, he needed a small dive-bomber that carried a light load, but bombs precisely: a single-engine Ju-87, or a dual-engine Ju-88.

Later, the war changed its course and turned from a quick war into a war of attrition. New cities inaccessible to Hitler's tanks became targets—London, Cheliabinsk, Bristol, Kuibyshev, Sheffield, and Magnitogorsk. Here, Hitler would not have minded having strategic aviation, but he did not have any.

Lapchinsky's ideas, written long before Hitler came to power, were used by Stalin. Not in 1941, as was planned, but in 1945. Stalin's Pe-2 dive-bombers and low-flying attack planes Il-2 suddenly attacked Japanese airbases, and Soviet tank units entered Manchuria. It was an easy victory. When Japan was bled to death by fighting in the Pacific, and the first A-bomb was dropped, Stalin conveniently struck from the rear and seized Manchuria, creating the

conditions for Mao's victory in 1949. Soviet paratroops landed in Chinese cities not to destroy bridges, roads, and factories, but to prevent their destruction. In such a war there was no work for strategic aviation.

In the 1920s and early 1930s, Stalin needed strategic aviation so that nobody could hinder him from building Soviet military and economic power. In the second half of the 1930s, Stalin more and more leaned toward the scenario of a war that would result not in the destruction of Germany, but in its takeover. In November 1940, Stalin fully decided to accomplish against Germany what he would in August 1945 accomplish against Japan.

Stalin's Preparations for War: Tanks

Germans were surprised to discover that it was practically impossible to stop the Red Army's KV tanks.

—ROBERT GORALSKI, *WORLD WAR II ALMANAC, 1931–1945*

Stalin's goal was to develop and mass-produce the best tanks in the world. Tanks were to be the spearhead for the Soviet offensive against Western Europe, and Stalin set about developing them as he built Soviet industry.

In 1933, the Red Army adopted the T-28 tank. A variation of this model was designed in 1937—the T-28 PKh (*Podvodny Khod*—"underwater traversing" tank). Tests showed that if necessary, all series of T-28s could be converted to cross water barriers underwater, at a depth of up to 4.5 meters and width of up to one kilometer with a stream speed up to one m/s (meter per second).¹ Not a single German, British, American, French, or Japanese tank from the 1930s could compete with the T-28 in terms of weapons, armor, or engine power.²

At the end of 1937, the Germans started producing the Pz-IVA, the most powerful German tank of the first half of World War II. It had 15-mm armor.³ The T-28's armor was of higher quality and twice as thick—30 mm. This most powerful German tank had a 250-horsepower engine. The T-28's was twice as powerful: 500 horsepower. The German tank had two machine guns, while the T-28 had four or five. The gun on the German tank was approximately equal to the Soviet one. The T-28 had a 76-mm KT-28 gun, while the German tank had a gun of slightly smaller caliber—75 mm; therefore, the shells were slightly lighter. The T-28 fired shells with an initial speed of 381 m/s. The German Pz-IVA had a slightly longer barrel (16.5 caliber); therefore the speed of the shells was slightly higher—385 m/s. Thus the muzzle energy of both guns was practically the same. Soviet designers could not reconcile themselves to the fact that the Germans had caught up with them at least in one parameter. In response, starting in 1938, the Soviet T-28 tanks were produced with a new L-10 gun. Its barrel length was 26 calibers. The muzzle velocity of its shells was 555 m/s. The Germans did not

catch up with this innovation until 1942. The L-10 Soviet tank gun in 1941 was unrivaled in Germany or anywhere else in the world. "In terms of arms, the T-28 absolutely surpassed all German tanks. The L-10 gun (as well as the KT-28, by the way) could effectively destroy the tanks of the *Wehrmacht Heer* at distances out of range for their weapons."⁴

The Germans installed the HL-120TR 300-horsepower engine on the later models of their most powerful tank, the Pz-IV. But they still did not catch up with the Soviet 500-horsepower engines. The Germans enhanced the armor to 30 mm. The Soviet response was the T-28 E, with a maximum thickness of 80 mm. The T-28 had sufficient allowances in its design to permit the installation of the 85-mm F-39 gun with a 52-caliber length.⁵ The tank successfully passed all tests with that gun model. However, at that time, the Soviet tank industry made another breakthrough: it created the T-34. Its classic design became the sire of the future development of tanks worldwide. Further modernization of the T-28 was unnecessary.

After the war, Soviet generals and historians called the T-28 obsolete. But the T-28 was obsolete only by Soviet standards, only compared to the T-34. In comparison with all foreign tanks, the T-28 was still outstanding. If in the summer of 1941 a foreign tank had had a 76-mm gun with muzzle velocity of 555 m/s and four or five machine guns, it would have been the national pride of that country. But nobody had such a tank. If a foreign tank had had a frontal armor of 80 mm, it would have been considered an outstanding design achievement.⁶ If anyone in the world in 1941 had had a 500-horsepower tank engine, this would have been a world record. The "obsolete" Soviet T-28 was a combination of three world records, each of which even taken independently would have been the national pride in any other country.

After the war, the Soviet historians excluded all T-28 tanks (and many others) from the statistics, and put them in the "obsolete and worn-out" category. However, the "obsolete" T-28 tanks captured by Finland in 1939 and 1941 were used by the Finnish army, served until the very end of the war, and were successfully used against the Red Army. One of the "worn-out" T-28s was remodeled into an evacuation vehicle and served until 1951. By the way, there were no spare parts for these tank models in Finland. But the T-28 was designed in such a way that even without spare parts it served for several years in a war in terrible climates, almost impassable terrain, against a powerful enemy—the Soviet KV and T-34 tanks. And it even served six years after the war.

On December 19, 1939, the Red Army enlisted in its ranks the T-34. Following are German reviews of its performance. General Field Marshal von Kleist said: "Their T-34 was the best in the world." Major General von Mellentin agreed: "We had nothing equal to the T-34." General Field Marshal von Rundstedt also thought that the T-34 was the best tank in the world. Colonel General Guderian remembered: "A large number of T-34 tanks were used in battle [Guderian is referring to the hostilities in October 1941 near Mtsensk, northeast of Orel], causing significant losses among our tanks. Previously existing hardware superiority of our tank forces was now lost and shifted to the opponent. Therefore, a prospect for rapid and continuous success disappeared."⁷ "Our 50-mm and 37-mm anti-tank guns were completely useless against the T-34."⁸

Lieutenant General Westphal admitted: "The arrival of Soviet weapons that surpassed the German ones in quality was a very unpleasant surprise. One such weapon was the T-34 tank, against which the German anti-tank weapons were powerless."⁹

Infantry General Blumentritt agreed with his colleagues: "In 1941, the T-34 was the most powerful of all existing tanks. . . . In the vicinity of Verei, the T-34 without any hesitation penetrated the positions of the 7th Infantry Division, reached the artillery positions and literally squashed the guns. One can imagine what kind of impact it had on the morale of the infantry. The so-called 'tank phobia' started."¹⁰

I could endlessly quote German soldiers, officers, generals, and even field marshals; entire volumes of rave reviews of the T-34 have been published. Its debut caused a sensation at the beginning of the war. Sixty years after the T-34 first appeared, British professor Richard Ogarkovets, world famous as the leading authority in the field of designing armored technology, believes that the world tank-building industry still remains fully under the influence of ideas incorporated into the design of this remarkable tank. The T-34 was the only tank in the world created before the beginning of World War II that was not obsolete by its end. The T-34 fought for decades after World War II. Not a single other tank in the world had such a long lifespan.

The arrival of the T-34 surprised both Stalin's enemies and his allies. Leading British historian and military theorist B. H. Liddell Hart said: "None of our tanks could compare with the T-34." French General G. Bouche recounted: "The arrival of the T-34 tank, significantly superior to German tanks, greatly surprised the Germans." German officers demanded the production of exactly the same tank. However, as Guderian explained, Germany, the homeland of Rudolph Diesel, could not design a sufficiently powerful diesel engine for tanks. Moreover, it was impossible to deliver the needed raw materials for the steel-casting industry to Germany and, as a result, during the war Germany was incapable of producing alloyed steel of the same quality as the Soviets.¹¹ The lack of alloy compounds in Germany resulted from the Molotov-Ribbentrop Pact. Stalin knew what he was doing on August 23, 1939. By supporting German aggression in Poland, Stalin made Germany the enemy of Britain and France. The blockade of Germany by the British fleet and the resulting shortages of many raw materials was an inevitable consequence.

The T-34 was armed with a 76-mm long-barrel gun, designed by Vasily Grabin (the barrel was 41 calibers). It was the most powerful tank gun of its time. If the T-34 had had no distinctions aside from this gun, it would still have been considered the best tank in the world, because it could destroy the most tanks of its kind. But the T-34 had other distinctions. In 1942, American experts conducted full technical tests and analyses of a T-34 given by Stalin, and concluded: "The distinguishing characteristics of the T-34 were: a low, flowing silhouette, simplicity of design, low specific pressure on the ground. The angles of the armor create brilliant possibilities for its protection."¹² The experts thought and continue to think that the shape of the T-34's body was ideal. The T-34 also had a powerful diesel engine, specifically designed for it. In the armies of other countries, such engines did not exist either at the beginning of the war or at the end. Just for that engine alone the T-34 could be considered the best tank in the world.

If the T-34 had neither a powerful gun, nor an ideal body shape, nor a diesel engine, it still could be considered the best tank in the world because of its wide caterpillar tracks, which allowed it to act on any terrain and in any weather. The T-34 surpassed any German tank in all parameters: speed, acceleration ability, cross-country ability, especially when moving on sand, mud, and snow.

The T-34 was famous, because all its innovations were incorporated into one design, and it achieved a harmonic combination of all its remarkable qualities. On top of everything, the T-34, unlike other tanks, was good for mass production. Any large-scale automobile factory could be converted to produce this tank. The production of the T-34 did not demand a highly qualified workforce. It was easy to use and repair. The T-34 had almost inexhaustible reserves for improvement. Its weight could be significantly increased without lowering the quality of its movement characteristics.

The T-34 served not only as a model for many imitations, but was also the prototype for many generations of new tank models. Not a single tank of World War II left behind it a row of descendants. The only exceptions were the T-34 and the KV. The KV was constantly improved upon and became the IS-1, then underwent a long evolution and turned into the IS-4 and the T-10. The lineage of the T-34 continues today, and direct descendants of the T-34 are among the most numerous units in the world.

In June 1941, the Red Army suffered a crushing defeat, which had to be explained. Communist historians acknowledged the remarkable qualities of the T-34, but added that these tanks were very few in number; there were only 967 of them. Many educated and honest historians repeated that on June 21, 1941, Stalin only had 967 T-34s. Even if this had been true, the word “only” was disputable—the rest of the world had none. In the five western border military districts, which constituted the first strategic echelon of the Red Army, there really were 967 T-34 tanks. But the forces of the second strategic echelon were being secretly transferred to the western regions of the country. They also had T-34 tanks. In total, the Red Army had 1,225 of them on May 31, 1941. By June 21, the factories shipped out and unloaded another 138 T-34s. On top of this, another 37 T-34s were produced, tested, but not yet shipped. Overall, at the time of the invasion, the Soviet Union had exactly 1,400 T-34s.¹³

However, even this was not all. The T-34 was produced in series. Meanwhile, the attempts to create an equal or superior tank in Germany began only on November 25, 1941. In June, July, August, September, and October 1941, Germany had not yet begun attempts to create an analogous tank, while the Soviet factories continued producing the T-34. During the second half of 1941, Soviet industry put out another 1,789 T-34s in addition to the 1,400 that existed on June 22. In 1942, the production of T-34s went at a rate of thirty-five a day. In 1942, 12,520 T-34 tanks were produced.¹⁴ Very few, I agree. But in Germany, the production of an analogous tank had not yet begun.

The German equal of the T-34 was the Panther, which first appeared in the summer of 1943 during the great tank battle at Kursk. The Panther was a magnificent tank. Some experts considered it the best tank of World War II, and claimed that the Panther surpassed the T-34 in all aspects. Oddly enough, after the war, practically all designers in the world copied the best aspects of the T-34, while nobody copied the Panther. This tank did not leave any descendants behind, and for a good reason. Let's look at those parameters according to which the Panther did not surpass the T-34.

First, the T-34 had a diesel engine, while the Panther had a carburetor one. A diesel engine was more economical and less susceptible to fire. Second, the Panther had a very irrational design. The designers copied many aspects of the T-34, but not the most important—the rational location of both the engine and the transmission, in the rear of the tank. As a result, the Panther weighed 44.8 tons, even though it was supposed to weigh 30 tons. The Panther

was considered a medium tank, but in weight it equaled the Soviet heavy tanks: the most massive version of the Panther weighed 45.5 tons, while the Soviet heavy tank IS-2 weighed 46 tons. In length, width, and height of the body, the Panther surpassed the Soviet heavy KV and IS tanks. This meant that it was easier to hit the Panther. If we have two safes of equal weights, but different sizes, the one that is larger in size has thinner walls. The same thing is true for tanks: larger sizes given equal weights always means weaker armor protection.

With its dimensions and weight, the Panther could not compete with the T-34 in anything related to mobility. The T-34 surpassed the Panther in maneuverability, acceleration, and cross-country mobility, that is, in all parameters needed for offence. No matter how ferocious a tank is in defense, a country cannot win a war through defense. I will reiterate that only mobility can bring victory. The T-34 was good for maneuver warfare, while the Panther was completely unfit for it. There was not a single successful offensive operation in history that was conducted with the participation of Tiger and Panther tanks. German General F. W. von Mellentin described the T-34 as “the best example of an offensive weapon of [World War II].” The heavy Panther could crush anybody in defense, but it could not compete with the T-34 on a raid of many kilometers deep into the enemy rear.

It is simple to create complicated things. It is very difficult to create simple things. The designers of the T-34 tank made it as simple as possible. Therefore, the T-34 was good for mass production. Before the war, tanks in the Soviet Union were produced in three main centers: Leningrad, Stalingrad, and Kharkov. Kharkov was lost during the course of the war. Leningrad was not lost, but the Kirov plant, which prior to the war built tanks, was only seven streetcar stops away from the front line. Leningrad was under siege, and had no metals, no energy, and therefore no mass production of tanks. Stalingrad was not lost, but the events of the war were not beneficial for mass tank production. After the three main centers stopped production, it was organized in new places, and during World War II there were more T-34 tanks produced alone than tanks of all types in Great Britain, Germany, and Japan put together.¹⁵

The Panther's main flaw was its complex design, which made the tank unfit for mass production. Only 5,976 tanks of this model were produced. Additionally, another 392 self-propelled guns based on the Panther were made.¹⁶ The Soviet Union produced nine T-34s for every Panther.¹⁷ For every self-propelled gun based on the Panther, the Soviet Union produced thirteen Su-85 and Su-100 self-propelled guns based on the T-34. Just of these two types, 5,139 self-propelled guns were produced.¹⁸

General Heinz Guderian loved the Panther with all his heart, but when Hitler ordered a halt in the production of all earlier models, so that only Panthers and Tigers would be produced, Guderian protested and managed to reverse the order. He was right: if only the most expensive and complex tanks were produced, there would be few of them. After the war Guderian wrote: “Such a path inevitably led to the defeat of Germany in the near future. The Russians would have won the war without help from the West, and occupied all of Europe. No force on earth could have stopped them. Europe's problems would have been simplified and we all would have learned what real ‘democracy’ means.”¹⁹

The Germans were unable to design a good tank for mass production. Therefore, until almost the very end of the war Germany had to produce obsolete models to supplement the Tigers and Panthers and compensate for the losses incurred in battle. The American tank expert Steven Zaloga went so far as to consider the production of Panthers a mistake: “The decision to enlist among weapons such a large, heavy, and complex tank as the Panther in the

category of medium tanks was one of the factors that limited the German tank production to a level much lower than the Soviet.”²⁰

The Panther and the T-34 should not even be compared. Comparing them is like comparing boxers from different weight classes. If Stalin didn't have any other tanks, then we would be forced to compare the T-34 with the Panther. But Stalin had the IS-2. The IS-2 was adopted in the same year as the Panther, and weighed the same. They should be compared. The Panther resembled the IS-2 tank in another aspect as well: the Panther was a complex, expensive tank for elite formations. The IS-2 was deployed in exactly the same way, to fight in heavy breakthrough tank units and nowhere else. With the same weight and roughly equal mobility characteristics, the IS-2 had a much more powerful armor and surpassed the Panther in fire power.²¹

In 1941, only two armies in the world recognized the necessity of heavy tanks. Obviously, they were the German and the Soviet armies. The order to begin project development of the first German heavy tank was given on May 26, 1941. The project was called MK4501: 45 tons, model one. The project resulted in the Tiger. Once again the German designers were unable to stick to the planned weight. The tank was supposed to be 45 tons, but came out at 57 tons. However, this happened later:: in 1941, obviously, there was no tank yet. By June 22, German designers had only made the first set of sketches. It was still a long time until the test models made of metal, but at least the attempt to create a heavy tank was made on paper.

In contrast, work on creating a heavy tank in the Soviet Union began in 1930. In 1933, the first Soviet heavy tank, the T-35, was produced in series and entered the ranks of the troops. It was a five-turret giant, weighed 45 tons, and was operated by a crew of eleven men. It was the only five-turret tank in the world that was used by troops. It had three guns and six machine guns. Its armor was 30 mm thick. In 1941, not a single German tank, and no other tank in the world, was equal to the Soviet medium T-28 tank. Obviously, none of them could even approximately compare with the heavy T-35. Design of the T-35 was continuously improved. For example, the models from 1938 increased the number of machine guns to seven, and the armor was made 50 mm. The last series of T-35 joined the troops in 1939. But the tank was improved even after the production was completed: after the war in Finland, all T-35s were returned to the factories and their armor was reinforced to 80 mm. The weight of the tanks reached 50 tons.

In 1939, government tests of three of the newest Soviet heavy tanks, the KV-1, SMK, and T-100, were conducted in combat conditions. These tanks were tested in “anti-tank” territory, in conditions in which the use of tanks was theoretically impossible. The Soviet heavy tanks withstood the extreme challenges of the war in Finland: the absence of roads, the obstacles hidden under piles of snow, the impenetrable forests, swamps, deadly fire, vast minefields, anti-tank ditches, steel hedgehogs, scarps and counterscarps, and cold temperatures that caused steel to crumble.

The bloody experiment in Finland proved that Soviet heavy tanks could fight successfully even in those conditions. Out of the three heavy experimental tanks, the KV-1 was recognized as the best. On December 19, 1939, the Red Army enlisted it among its weapons, and the industry received orders to produce it in series. In February 1940, the heavy KV-2 tank was tested in military conditions and also was accepted into the army.

The KV-1 and KV-2 weighed 47 and 52 tons, respectively. The KV was the first tank in the world with a true anti-shell armor: it had a frontal armor of 75 mm, which could be

further reinforced. The wide caterpillar tracks of the KV allowed it to fight on almost any terrain in any weather conditions. Imagine the situation of the following year, 1941: German tanks got stuck in the snow and the mud; the crews (and future historians) cursed the weather and lack of roads, while the KV advanced through the mud. Hitler lost the war, but the mud and the cold weather were not to blame—it was the German designers, who counted on easy victories and on operations only during the resort season and only in places that had good roads. They should have designed tanks for war, not for parades. They should have tested them in Finland. They should have given them wider caterpillar tracks. And they should have installed diesel engines. The KV had a 600-horsepower diesel engine. The Soviet tank's diesel engine surpassed all foreign tank engines in power, reliability, and economy. The use of a diesel engine drastically reduced the risk of catching fire. A 76-mm long-barrel F-32 gun was installed on the KV. At that time, this gun was unrivaled in the world. In comparison, Germany had great tanks, which conquered all of Europe, but the most powerful German tank gun at the beginning of World War II was the 75-mm short-barrel gun on the Pz-IV tank. The initial speed of the shells it fired was 385 m/s. This was a very good gun. But the KV-1 had an initial shell speed of 662 m/s. The difference in initial shell speed was a difference both in the energy of the shell and in the precision of firing.

The KV-2 had even more powerful weapons. It had the 152-mm howitzer. The most powerful German tank shell of that time weighed 6.8 kg. It was a very good shell for a very good weapon. But the KV-2 fired concrete-destroying shells that weighed 39.9 kg at an initial speed of 529 m/s, and high-explosive shells that weighed 48.7 kg. There were even reports of a shell that weighed 50.8 kg. The Chief of the General Staff of the German land army Colonel-General Franz Halder simply did not believe the report of a weapon of such caliber on a Soviet tank.²² At the same time two other heavy tanks, the SMK (55 tons) and the T-100 (58 tons), also passed government tests. If the choice had fallen on any of them they could have been launched into production. Aside from these tanks, the KV-3 and the KV-220 were created and subjected to government tests. Prototypes of the KV-4 (90 tons) and the KV-5 were also designed but never produced because of Hitler's attack.

Germany and the USSR shared the two first places in heavy tank production. There was nobody in third place. Elsewhere around the world, generals and designers did not even think of drafting a heavy tank on paper. The situation was such that while Germany had a heavy tank just on paper, other countries did not have heavy tanks even on their minds, while the Soviet Union was the only country in the world that in 1941 had heavy tanks both in experimental stages and in series production. The Red Army was the only army in the world that had heavy tanks among its units.

Nonetheless, Western and Soviet historians claim that Germany was ready for war, and the Soviet Union was not. They pronounced the T-35 tank obsolete and didn't mention it in statistics, even though the rest of the world had nothing comparable to the T-35 tank. The T-35 surpassed everything other countries had in terms of weapons, armor, and engine power—all the main characteristics. Moreover, the T-35, despite its size and weight, exerted less pressure on the ground than the German tanks, which meant it had much greater mobility, did not sink in snow, mud, and soft ground, where twice- and three-times-lighter tanks of other armies sank. If the T-35 were declared obsolete, all other tanks around the world had to be declared obsolete as well, and excluded from statistics.

As for the KV, the same trick was used. It was described as a great tank, but there were “only” 508 of them. Once again, I will repeat that the rest of the world had none! Besides, 508 KVs were just in the first strategic echelon of the Red Army on May 31, 1941. On the same date, the second strategic echelon had an additional 128 KVs. By June 21, factories unloaded another 41 KVs. Yet another 34 KVs were produced, but not yet shipped.²³ Thus, on June 21, 1941, the Soviet Union had 711 KV tanks, and continued their production through all of 1942, while German designers drafted sketches, made prototypes, and assembled test models.

It is impossible even in theory to compare the KV-1 and KV-2 with the very best German tanks, the Pz-III and Pz-IV: the KV was a heavy tank, while the German army had no tank of this weight class in 1941. The leading German theoretician and practitioner of tank warfare Colonel General Heinz Guderian maintained that “warfare of tank against tank is similar to naval warfare. There, battle is also conducted only by the strongest.”²⁴ When the war began, Stalin put into use the KV-1 (47 tons) and the KV-2 (52 tons), as well as the “obsolete” T-35 (50 tons), while Hitler had nothing similar and was forced to use the best that he had—the obsolete medium Pz-III and Pz-IV tanks, which weighed 20 to 21 tons. I would not compare them at all if the German army had anything more noteworthy, but it did not. During the war, the KV fought against the best that was available in the German army—and the war drew its comparisons.

General of the Army K. N. Galitsky described the battle between one heavy KV and three medium German Pz-IIIIs: The KV fired two shots and two of the German tanks were destroyed, while the third German tank decided to leave, but its engine stalled while trying to drive across a ditch. The KV caught up with it and “smashed it with its weight, crushed it like a nut.”²⁵ General Galitsky described another incident: A damaged Soviet KV was found, surrounded by ten destroyed German tanks. The KV was hit by forty-three shells, out of which forty made dents, and only three went through the armor. While the German tanks were destroying one KV, it destroyed ten German tanks.

Colonel General A. I. Rodimtsev remembered: “During the course of eleven months of war, we did not know a single instance in which a German gun pierced the armor of this tank. It had happened that a KV tank had ninety to one hundred dents from enemy shells, but still continued to go into battle.”²⁶ Other Soviet generals had many similar examples. Perhaps Soviet generals were embellishing the situation? No. In German sources of that time there was a subdued panic: German tankers were used to their tanks being the best in the world, and suddenly they came against the KV. They were unprepared. German documents of the time are sufficiently known. I will not repeat them. The general conclusion for the year 1941 was: “The KV is the most frightening weapon that a soldier has ever had to encounter in battle. Anti-tank guns are powerless against it.”

The works of contemporary Western historians also confirm the invincibility of the KV. The British military historian R. Goralski described a battle between one KV and a group of German tanks and anti-tank guns: during just this one battle, the KV took seventy direct hits; all the shells left dents in the armor, but not one went through it.²⁷ American historian Steven Zaloga also provides similar examples. (I recommend his books to everyone for there is no better foreign expert on Soviet tanks.) He wrote of an incident when one KV destroyed eight German tanks, took thirty direct hits from a very close range, and not one shell pierced its armor.²⁸

The KV remained the most powerful tank in the world throughout the first half of World War II, right up to the Stalingrad battle. No other country in the world had anything comparable in the same weight class. The KV design had reserves for improvement, which enabled it to undergo several stages of development from the KV-1 to the KV-13. Later, it turned into the IS-1 and then the IS-2, the most powerful tank of World War II.

The evolution yielded stronger armor and increased gun power, and in 1943 the IS-2 was put into use. B. H. Liddell Hart wrote: "These monsters had six-inch [150-mm] armor and were armed with 122-mm guns, while the most powerful German Tiger had just an 88-mm gun and four-inch [100-mm] armor."²⁹ Steven Zaloga said: "In rare instances, a shell from the IS-2 tank did not pierce the armor of German tanks, but this did not change anything: the energy of the shell was so great that it tore the turret off any German tank."³⁰ Major General F. W. von Mellentin admitted: "[IS-2s] caused excessive problems for our Tigers."³¹

Designers of the Soviet heavy tank accomplished a technological feat: they almost doubled the thickness of the armor and installed a gun that was three times more powerful, while staying in the same weight class and even reducing the weight of the heavy tank. The KV-1 weighed 47.5 tons, while the IS-2, its direct and several times more powerful descendant, weighed 46 tons.

Stalin had a remarkable pair: the most powerful heavy tank, in terms of fire power and armor, for elite units, and a wonderful, mass-produced, truly medium T-34 for regular units. Stalin understood that the T-34 needed to be improved, but it couldn't be allowed to turn into a heavy, complex, expensive tank for the elite. In that case, the T-34 would stop being a mass-produced tank, and the war would be lost. Soviet designers succeeded in improving the characteristics of the T-34 during the war, but in weight and in simplicity of production and maintenance they kept it in the medium tank class, which could easily be put out by the tens of thousands.

Soviet medium and heavy tanks were an inseparable pair, like two complementary weapon systems. The availability of tens of thousands of relatively inexpensive and simple T-34s allowed them to be used anywhere, thereby conserving the energy of the heavy tanks for secondary objectives. The crews of the T-34s could confidently fight, knowing that they had the support of an almighty KV or IS behind them. The availability of the heavy tank increased the battle capabilities of the medium tanks.

10

On the “Obsolete” Soviet Tanks

If I had known that the Russians really possessed such a number of tanks . . . I think I would not have started this war.

—ADOLF HITLER, AUGUST 4, 1941

When Hitler came to power in Germany in 1933, the German armed forces had zero tanks, while the Red Army had 4,000 tanks. In the whole of 1933, not a single tank was produced in Germany; in contrast, 3,819 tanks of all types and modifications were produced in the Soviet Union.¹ The production of tanks in Germany began in 1934: in the next five years, German factories produced 2,683 tanks.² Soviet factories in the same time period produced 14,283 tanks.³ On January 1, 1939, the Red Army was equipped with 21,100 battle-ready tanks.⁴ In 1939, Hitler started World War II with 3,195 tanks, the same number that Soviet factories produced per year in peacetime.

In 1941, the German army, by a crushing blow, defeated gigantic gatherings of Soviet troops in the border regions. Thousands of Soviet tanks were destroyed or simply abandoned by the troops. This catastrophe had to be explained somehow. Communist historians explained what happened very simply: the tanks were obsolete, and therefore useless. The whole world laughed at Stalin and at his “obsolete” tanks. But how many of them were there? To this question, an equally simple answer was prepared: why count them if they were obsolete? For the six decades since the disaster of 1941, the number of Soviet tanks has never officially been named. Only after the dismantling of the Soviet Union has the truth slowly started to emerge.

What were these “obsolete” tanks? A few thousand of them had the “BT” marker. Their spiritual father was the great American tank genius George Walter Christie. Soviet commanders and designers were the only ones to see the value of Christie’s achievements. Two of Christie’s tanks were purchased and shipped to the Soviet Union with fake documents, in which they were listed as agricultural tractors. On December 24, 1930, a ship carrying the “tractors” of Christie’s design left New York.

In the Soviet Union, all aspects of Christie's "tractors" were carefully studied. An entire family of tanks was created based on their design—the BT-2, BT-5, BT-7, BT-7A, and BT-7M. BT stood for *bystrokhodnyi* (high-speed) tank. The shape of the BT was simple and rational. Not a single tank in the world during the prewar period and the early period of World War II had an armor of such a shape. The best tank of World War II, the T-34, was a direct descendant of the BT. The shape of its body was a development of the idea of the great American designer. After the T-34, the principle of a sloped location of the frontal armor sheets was used on the German Panther, and later on tanks around the world.

In the 1930s, practically all tanks around the world were produced according to one design: the engine in the rear, the transmission in the front part. The BT was an exception: its engine and transmission were both in the rear. Twenty-five years later, the entire world understood the advantages of the BT design. The BT tanks were heavily armed for their time. The 45-mm cannon could penetrate the armor of any foreign tank. Great Britain and the United States began installing such cannons on their tanks only a decade later, in 1942 and 1943. In addition to thousands of BT tanks, armed with 45-mm cannons, 154 BT-7As were manufactured and armed with 76-mm KT-26 cannons.⁵ At the beginning of World War II, no tank in the world outside the borders of the Soviet Union had weaponry of comparable caliber.

What about the armor? The BT had just bullet-proof armor. At that time, most of the world had tanks with the same kind of bullet-proof armor. The engine is the heart of the tank. The BT-2, which was made operational in the Red Army in 1932, had a 400-horsepower M-5 engine. German tanks began having engines of equal power only by the end of 1942. The specific power of the BT was 36.4 horsepower per ton of mass.⁶ Not a single tank in the world had such a high specific power, which allowed the tank to do unbelievable things: "BT units could jump over obstacles to a distance of 15 to 20 meters; a few could do it to a distance of 40 meters."⁷ The cinematography of those times preserved such incredible stunts of Soviet tank drivers for posterity. Nonetheless, Soviet historians categorized these tanks among the obsolete models, calling them so obsolete that until 1991 they were not included in statistics.

In April 1941, Germany began producing in series the T-IIIJ tank. In the German army it had the highest specific power—13.9 horsepower per ton of mass. How could the BT-2 be obsolete, if its specific power was almost three times higher than that of the best German tank? The first BTs had a speed of 69 mph, that is, over 110 km/h.⁸ Seventy years later any tanker would still be envious of such high speed. Soviet sources point to the much lower figures of 86 km/h for BT-7Ms, and 72 km/h for BT-2s and BT-5s, as maximum speeds for BT tanks on paved roads.⁹ This discrepancy, between Soviet and foreign sources, is simply explained: on Soviet roads, the engine was too powerful for the transmission, so a speed-limiting device had to be installed. When the tank was used on highways, the device could easily be taken away. But even if we think of the BT speed as being "only" 86 or even just 72 km/h, at that time no other tanks in the world had such statistics.

The BT tanks were constantly improved. In 1936, after a series of experiments, a number of BT crews became capable of crossing rivers underwater. At the beginning of the twenty-first century, still not all the tanks of the most developed countries have such capabilities. In 1939 the Red Army received the BT-7M. It had the following capacities: on tracks over

unpaved roads it could run for 520 km; on tracks over paved roads—630 km; on wheels over paved roads—1,250 km.¹⁰ Sixty years later, this is still the dream of any tanker. The BT-7M had a 500-horsepower engine. At that time, the most powerful foreign tank engines were: the 300-horsepower German Meibach HL 120TRM, the 307-horsepower French Renault for the Renault B1bis tank-horsepower.

The “obsolete” BT-7M had an extremely powerful engine—a legendary high-speed B-2 tank diesel. No other country was able to create such an engine before the end of the war; all of Stalin’s enemies and allies had to get by with carburetor engines, which made their tanks extremely vulnerable to fires. In some countries, some tank models were equipped with diesel engines, but these were weak automobile engines. The rest of the world learned to use powerful diesel engines, specifically designed for tanks, only after the war, about ten to twenty years after it was done on the BT-7M.

Having said so many positive things about the quantity and quality of Soviet BT tanks, we must be just and note one small disadvantage: these tanks could not be effectively used on Soviet territory.

The main advantage of the BT tank was its speed. This quality dominated all its other qualities to such an extent that it even had a bearing on the tank’s name—high-speed tank. The BT tank was a weapon of aggression. All of its characteristics make the BT resemble a small, but extremely mobile, horseback warrior from the undefeatable hordes of Genghis Khan. That great world conqueror vanquished all his enemies through a sudden attack of colossal masses of extremely mobile warriors. He destroyed his enemies mainly not by powerful weapons, but through decisive maneuvers. He did not need heavy, clumsy knights, only light, quick, mobile troops, capable of traversing vast territories, crossing rivers, and going deep into the enemy’s rear. The BT tanks were exactly the same. At the beginning of World War II, the Red Army had 6,456 BT tanks—that’s as many as all operational tanks of all types in the rest of the world.¹¹ Soviet commanders clearly understood that BT tanks were not good for conventional warfare, but they were great in situations when the Red Army suddenly broke into enemy territory. “High speed tanks [by] their nature are a weapon of sudden attack. Their full effect (and success in general) can be obtained only if their use is sudden.”¹² In other words, if we suddenly attack the enemy, we will have success, but if the element of surprise is not on our side, we will not.

The BT tanks could only be used in aggressive warfare, only in the enemy’s rear, and only in a decisive aggressive operation, when hordes of tanks suddenly broke through onto enemy territory and bypassed points of opposition, thrusting deep behind enemy lines, where there were no enemy troops, but where all cities, bridges, factories, airports, ports, storage facilities, command posts, and communication units were located.¹³

The amazing aggressive characteristics of the BT were achieved by using a unique landing gear. On field roads, the BT moved using caterpillar tracks, but when it found itself on good roads, it shed the heavy tracks and sped forward on wheels like a racecar. It is well known that speed and cross-country ability are a trade-off: either we have a racecar that only rides on good roads, or a slow tractor that can ride anywhere. The Soviet marshals chose in favor of the racecar, so the BT tanks were not good for the bad roads of Soviet territory. In the battles fought on Soviet territory, thousands of BT tanks were abandoned. Off the roads, even with the caterpillar tracks they were difficult to use. The great potential of the BT tanks was never realized, because it was impossible to realize it on Soviet territory. To the question

of what was most important for the BT tanks, its wheels or its caterpillar tracks, Soviet textbooks give a clear answer—the wheels. The BT's most important characteristic, its speed, was achieved through use of its wheels.

Seventy years ago, there were no highways on Soviet territory. And in 1939, not a single immediate Soviet neighbor had an autobahn either. But in the following year, through the Molotov-Ribbentrop Pact, Stalin divided Poland and established common borders with a nation that had autobahns. This nation was Germany.

They say that Stalin's tanks were not ready for war. This is not true. They were not ready for a defensive war on their own territory. They simply were prepared to fight on different territories.

Here is another family of Soviet tanks: T-37A, T-38, and T-40. The T-37A was received by the Red Army on August 11, 1933. It weighed 3.2 tons, its crew consisted of two men, and it had bullet-proof armor. It was armed with one DT machine gun, had a 40-horsepower engine and a maximum speed of 36 to 40 km/h on paved roads and 6 km/h in the water. The T-37A was a light tank—but light does not mean bad and obsolete. The T-37A was the first amphibious tank in the world to be regularly used by troops.¹⁴ Even if the T-37A really was a bad tank, its inclusion in the armed forces still meant a technological breakthrough of historical importance, because there was nothing comparable or close in the armies of other countries at the time. The Japanese actively pursued amphibious tank warfare in the 1920s and 1930s. They even tested a few prototype models. But not one of the models was mass-produced as a part of the Japanese armed forces before 1941.

The German Pz-I was accepted by the army a year later—in 1934. It had almost the same weight—3.5 tons, the same crew—two men, the same bulletproof armor, and the same caliber machine gun. Only it could not float. When the high-minded scholars laugh at the T-37A that could float, I offer to compare the characteristics of the oldest, lightest Soviet amphibious tank with the characteristics of the best, most powerful German amphibious tank. Here, the laughter stops. It turns out that Germany does not have and never had amphibious tanks. Before the war it had none, and during the war none appeared. The great Germany entered the twenty-first century without amphibious tanks. It is unknown when it will begin producing them. Stalin on the other hand had amphibious tanks in the early '30s. In this field Stalin was many decades ahead of Hitler.

France did not have amphibious tanks at that time. Britain also had none before or during the war. The birthday of American tank forces is July 10, 1940. When the *Wehrmacht Heer* crushed with its tanks Poland, Belgium, Holland, France, and the British army on the continent, the Red Army tanks were crushing the Japanese Sixth Army at Khalkhin-Gol and were "liberating" Finland, Estonia, Lithuania, Latvia, Bessarabia, and Bukovina. America at that time had no tank troops at all. After the defeat of French and British troops on the continent, American generals realized that it was time to get off horses and to think of creating tank troops. A year later, in June 1941, the United States had less than four hundred tanks.¹⁵ These were weak, old-fashioned machines, very tall, with very light armor and a multi-tiered distribution of completely obsolete weapons. The most powerful tank weapon of American tanks in 1941 was the 37-mm cannon. Even this was mounted only on some tanks. The majority of American tanks had only machine guns. America had no amphibious tanks at the time. By the end of the war, in 1944, the United States had developed amphibious armored personnel carriers of huge dimensions, and some of them had the turrets of light tanks. These

were reliable machines, they had great floating capability. But nonetheless, these were not tanks, and nobody tried to call them such. So, the difference we have is: in America, something resembling an amphibious tank appeared by the end of the war, while in the Soviet Union, amphibious tanks were enlisted in the armed forces long before the war's beginning.

So, what was the nature of the "light and obsolete" T-37A? Here is some information about it. In August 1935 upon orders from Voroshilov, the Commissar of Defense of the USSR, seven T-37As started out from Leningrad, traversed several tens of kilometers on caterpillar tracks, then sailed along the river Luga, through impenetrable weeds, then on to the river Shelon and Lake Ilmen. There was a storm on the lake. The distance across the lake was 55 kilometers. The tanks crossed this distance in 8 hours and 15 minutes. Then they came to the river Volkhov, the Novoladozhsky Canal, and the ferocious, treacherous river Neva. All seven tanks reached the finish line by the Petropavlov fortress. In eleven days they had crossed seven hundred kilometers, six hundred of them by sailing—all this without a single accident or even a breakdown.

Of course, not every single T-37A and not every tank driver was capable of setting such a record. Nonetheless, this is a record that since 1935 has not been successfully repeated by anybody. Nobody has even come close to reproducing it. Until 1941, the position of the rest of the world regarding the creation of amphibious tanks had barely changed. In 1941, no country in Europe and America (other than the Soviet Union) had amphibious tanks as part of its national armament. That year, only in Japan did the emperor's fleet begin implementing the floating Gami tank for amphibious assaults; the Gachi and Togu floating tanks were introduced later on.¹⁶

The Soviet T-37A was produced from 1933 until 1936. A tank, if there is no war, can serve for ten, fifteen, even twenty years. In theory, the T-37A tanks that were produced in 1933 were scheduled to be replaced between 1943 and 1948, perhaps even later. The last tanks, produced in 1936, did not have to be replaced until 1951 to 1955. How could they be too old in 1941? And how did it happen that unique tanks, which by 1941 had only served five to eight years, were completely obliterated from the historical record?

What are they needed for? What use comes from amphibious tanks? If we are defending our own territory, if we are conducting strictly defensive warfare, amphibious tanks are not really needed. We can get by without them. In order to stop the enemy, one wants to have tanks with heavy armor and powerful weapons—the heavier and more powerful, the better.

If we cannot stop the enemy in defensive warfare, we are forced to retreat. We retreat using our own bridges. When threatened with a takeover, we can detonate our bridges and send them up into the sky. There is little use for tanks with light armor and machine guns in a defensive war. Their ability to float also remains completely unused: there is nowhere to sail to in defensive war.

But if we are conducting a crusade for world domination, then in order to herd the population of the planet into concentration camps, labor armies, and barracks, we have different needs. In order to break through the enemy's front, we need heavy tanks, more armor, and more powerful cannon. If a battle occurs, if two waves of tanks collide, once again, we need the most powerful tanks. Once the front line is broken and the enemy's tank waves are deflected and crushed, our task becomes to take advantage of the moment and complete a thrust deep into the enemy's rear, in order to split up his defenses, to have access to his communications and supply lines, to reach the aortas in order to cut them, to cut the enemy

off from his supply bases, to reach his capital, his industrial regions, his sources of oil, and his ports. A heavy tank is not very good for such a thrust. Due to its weight, it breaks roads and bridges and gets in the way of all those who are following. A heavy tank consumes a lot of fuel—try to provide fuel to several thousand tanks and artillery tow trucks and tens of thousands of automobiles, which are pushing forward deep into enemy territory. Aside from all this, a heavy tank is also slow and not very agile. It slows down the movement of your columns. Moreover, it quickly wears out and chokes, like a heavyweight in a marathon. For a forward thrust, medium and light tanks are ideal. They have less armor, weaker weapons, but they have much higher speed, maneuverability, and cross-country ability, and they are more economical with their fuel.

Now our armored armada is standing before a water obstacle. Here all heavy and medium tanks, and those light ones that have not been taught how to float, lose all their aggressive options. Their value is zero. They need a bridge. But the enemy protects the bridges, and blows them up when threatened with a takeover. Bridges have to be fought for. And it is better to fight for them not from our side, but from the side of the enemy, from where they are not anticipating it. In this situation, the value of light amphibious tanks grows tremendously. If two, three, five, ten such tanks sail across the river during the night in the direction of the bridge, and with a sudden attack from the rear seize the bridge, this can decide the fate of an entire operation, or even an entire war. Now you can send to the enemy shores, across the newly seized bridge, your heavy and medium tanks, along with artillery, infantry, staff, hospitals, thousands of tons of ammunition, fuel, and spare parts. You can use the seized bridge to send in reserves, and to send the wounded, prisoners, and trophies to the rear, to send damaged machinery back for repair.

If it is impossible to seize the bridge, the amphibious tanks become truly priceless. If there are no enemy bridges, we need to establish our own temporary bridges and means of sending goods across the river. For this we need to establish a bridgehead on the other side. The infantry is sent into battle. On logs, wooden planks, and inflatable rafts, they swim to the other shore. Meanwhile they are being fired upon by machine guns, mortars, and automatic rifles. Here, among the swimming men, imagine having ten or twenty light tanks. Their armor is not harmed by bullets and shell fragments, while their machine guns are capable of firing when none of the swimming men can.

Now we have reached the other shore. The most important thing is to catch hold of something, to dig our forces into the ground during the next twenty minutes or so, so that no counterattacks can hinder us. Then the mortars and machine guns are not so destructive, and the enemy gunners and snipers are not quite so deadly. Our wet, wounded, and exhausted infantry does not carry heavy weapons or ammunition. So, in these very first, most frightening minutes on enemy shores, the presence, help, and support of even one of the lightest tanks with just one machine gun is far more valuable and important than ten more powerful heavy tanks that would be forced to remain on our side of the river.

The number of Soviet amphibious tanks was kept secret for half a century. Later, it slowly began to become clearer. So, how many of them were there? The answer is: there were 2,627 T-37A tanks produced.¹⁷ In local conflicts the T-37A was rarely used, and they were rarely sent abroad. So in 1941, they were almost all fully functioning. In 1936, production of a perfected T-38 amphibious tank began. This tank continued to be produced in series until 1939. Overall, 1,375 tanks of this type were produced.¹⁸ The Kremlin historians called this

tank obsolete as well. But we will ask the same question: how could a tank be obsolete, if there were no analogous tanks in the world, and its age was only between two and five years?

December 19, 1939, is the brightest and the most remarkable day in the history of world tank design. On this day the Red Army received and enlisted an entire spectrum of new armor-tank weaponry—the three newest tanks: the light amphibious T-40, the medium T-34, and the heavy breakthrough KV tank. The T-34 is the best tank of all time. The KV was the most powerful tank in the world during the first half of World War II, right up until the Battle of Stalingrad. But the T-40 was no worse than these. In its class, it was also the best in the world and also had no equal.

It is interesting that the Kremlin historians remember the T-34 and the KV, but forget about the T-40. Meanwhile, the T-40 had a new, never-before-seen body shape, weighed 5.5 tons, and was armed with two machine guns: the large-caliber DShK and the regular DT. A variant of this model, the T-40S, was armed with 20-mm automatic cannon instead of the DShK. By June 21, 1941, a total of 277 T-40 tanks were built.¹⁹

By June 22, 1941, Hitler had on the eastern front 180 tanks in the under-six-ton category.²⁰ Not one of them was amphibious and not one of them could compete with the Soviet light tanks. Stalin, on the other hand, had more than 4,000 tanks in this weight category. All of them were amphibious. Among them were 277 T-40s, which not only were amphibious, but also were capable of using their large-caliber DShK machine guns (and of course the 20-mm cannons) to pierce the armor of the German Pz-I tanks. Moreover, German Pz-I production was stopped in 1938, and these tanks not only were obsolete but also heavily worn-out, while the T-40 tanks were still in production, the paint not yet dried on many of them.

Foreign experts, those who understand even a little bit about tanks, talk of the T-40 with sighs of high regard. The vast majority of the T-40s were less than a year old. Some had left the factory doors on June 21, and some were still in the factory courtyard. When did they have time to become obsolete? When did they have time to become worn out? On June 22, 1941, on the eastern front, Hitler had 3,350 tanks in total of all types, all of them obsolete and among all of them not a single amphibious one, while Stalin's amphibious tanks alone numbered over 4,000.

By overcoming stormy Lake Ilmen, even the oldest of Soviet amphibious tanks proved the possibility of crossing the English Channel. But these tanks were designed for action on lakes and rivers. For crossing the English Channel, Stalin had other designs in the works for the future—the amphibious tank PT-1 and its variants. It weighed 14 tons, had a 500-horsepower engine, a speed of 6 km/h in the water and could reach 62 km/h on land, and 90 km/h when it shed its caterpillar tracks.²¹ This was a hybrid of a highway and an amphibious tank, a cross between a reconnaissance and a lightning battle tank. It was armed with a 45-mm cannon and four machine guns. It had a crew of four men. The PT-1 had a large body and impeccable floatability. This tank was designed and tested, but was not launched into series, for now sailing across the channels was not in the plans. When it would become needed, it could be launched into series.

The fate of Soviet amphibious tanks is a sad one: they were of no use in defensive war. Where would they sail? Upon orders from the People's Commissar for Defense, Marshal of the Soviet Union Timoshenko, and the chief of the general staff, General of the Army Zhukov, tens of thousands of tons of spare parts for the tanks, hundreds of thousands of tons of ammunition and fuel, were brought out to the very borders of the country. In the first

hours of the war, all this fell under fire or in the hands of the enemy. Soviet tanks were left without fuel, ammunition, or spare parts. Four thousand light amphibious tanks demanded a large amount of fuel and had little use in defensive war. Therefore, commanders easily parted with them: they ordered what was left of the fuel to be pumped into the medium and heavy tanks. The light ones were blown up, burned, broken, sunk, or just abandoned.

The best (and only) in the world, Soviet amphibious tanks in 1941 became unnecessary and played no role in the war. But why does nobody ask the question: why then were they developed and built? What were they prepared for? Why did Stalin need four thousand amphibious tanks, which he could not use in defensive war? Where was comrade Stalin planning to sail?

Winged Genghis Khan

Logic hinted that we should not wait for the enemy to bring all his aviation into action, but instead we should ourselves take initiative in the air and be the first to carry our massive strikes against his air bases.

—CHIEF MARSHAL OF AVIATION A. NOVIKOV,
IN *VOENNO-ISTORICHESKY ZHURNAL*

“**S**talin” is not a real name. It is the most famous of many pseudonyms of a man who for thirty years led the most criminal and most bloody empire in human history. But it is not his only pseudonym. Like every big criminal, Stalin had several different names and nicknames: “Vasiliev,” “Chizhikov,” “Besoshvili” (“son of the devil”), “Ivanovich,” and others. His closest comrades had the right to use the nickname “Koba” in their tight circle. Under this name Stalin was known long before he came to power, when he was a simple bank robber.

In extraordinary cases, Stalin used yet another secret pseudonym: “Ivanov.” Sometimes a minister, ambassador, general, admiral, or marshal received a cable, which began simply and harshly: “Comrade Ivanov ordered . . .” The highest-ranking leaders of the Soviet Union knew that this order must be obeyed at any cost, quickly, precisely, and within the indicated deadline. There was only one price to pay for an imprecise or untimely fulfillment of “Comrade Ivanov’s” orders—one’s life. In turn, every high-ranking official—a minister, ambassador, marshal, or other—could at any moment write a letter or telegram and send it simply to the address: “Moscow. Ivanov.” Bypassing all steps, the letter or telegram with such an address without any delays was laid directly on Stalin’s desk.

And one more fact which seems at first glance to have no ties to anything said above. In the summer of 1941, the Red Army suddenly employed completely unusual weapons: the multiple-launcher rocket weapons BM-8 and BM-13. They entered history under the name “Stalin’s Pipe Organs” or “Katyusha.” On August 6, 1941, the Red Army was equipped with a multiple-launcher rocket artillery system, the BM-8-36, and in the summer of the subsequent year, 1942, the BM-8-48.¹ A salvo from one BM-13 was sixteen rocket-propelled

rounds of 132-mm caliber. A salvo from the BM-8 was thirty-six rocket-propelled rounds of 82-mm caliber (forty-eight rounds starting in 1942). One battery consisted of four to six BM-8s or BM-13s. Usually one target was fired upon not by one battery, but by a group of batteries or even regiments. The advantage lay in the fact that hundreds or even thousands of missiles covered a huge territory almost simultaneously. Fire from a group of batteries was an avalanche of fire, accompanied by wild roar and noise. Many German soldiers, officers, and generals remember that this was a terrible weapon. General Field Marshal Albrecht von Kesselring: "The terrible psychological effect of 'Stalin's Pipe Organs' is a highly unpleasant memory for any German soldier who was on the Eastern front."²

The statistics are as follows: on June 1, 1941, the Red Army had seven BM-13 rocket launcher vehicles. One month later, there were seventeen such vehicles. Some were destroyed in battle, but others were produced, and by September 1 there were forty-nine of them. Production of the BM-8 began at the same time. By October 1, 1941, the Red Army, despite its losses, had 406 BM-8s and BM-13s. Later on, the count would mount into the thousands, and soon this weapon became a mass weapon. Despite losses of industrial and raw material bases, the Soviet Union managed to quickly supply its army with a principally new system of weapons.

In 1940 the Red Army's Air Force received into their inventory the newest airplane, the "Ivanov" Su-2. It was created by a group of designers headed by Pavel Osipovich Sukhoy, one of the greatest aviation designers of the twentieth century. Stalin personally issued the order to design the Ivanov. In the history of Soviet aviation, there was only one airplane that was designed under Stalin's secret pseudonym; moreover, the name of the project was not the initiative of devoted low-ranking officials, but given directly by Stalin himself. Aviation designer V. Shavrov testifies: "The codename 'Ivanov' was given according to Stalin's order. It was his telegraph address."³ There was no airplane yet, the designers had not even picked up their pencils, but Stalin had already given his name to the plane. The eventual production was planned for about 100,000 to 150,000 planes of this type.

The Su-2 had many uses: it could be a light bomber, a tactical reconnaissance plane, and an attack plane. Its design was extremely simple and rational. The Su-2 was better suited for mass production than any other airplane in the world. It possessed great firepower. Under its wings it could carry up to ten rocket-propelled shells of 82-mm or 132-mm caliber. These were eventually installed at the end of 1941 on some of the aircraft; they were the same missiles that were fired by "Stalin's Pipe Organs," the BM-8 and BM-13. The rocket-propelled shells were a ferocious weapon, especially if used suddenly and simultaneously by groups of ten planes from an extremely low altitude. Groups of Su-2 planes were to become "flying batteries." Aside from rocket missiles, the Ivanov Su-2 carried 400 to 600 kilograms of bombs, and five ShKAS machine guns (on the later Su-2 modifications), which at that time held the record in firing rate.

This was a magnificent airplane. The Su-2 had dual controls—one for the pilot and one for the gunner-navigator sitting behind him. Therefore, there was no need to put out a training version of the model: every battle-ready Su-2 could be used for training, and every plane used for training could also be used in battle. This simplified the mass preparation of pilots. The Su-2 could be managed by a pilot of any qualification.

Lieutenant General Anatoly Pushkin (in 1941 he was a major, commander of the 52nd Air Regiment) remembers: "The Su-2 was also great because it did not need airbases. It could take off and land on any even field."

Marshal Ivan Pstygo: “The Su-2 made a strong impression—it was a bomber, but looked like a fighter—small, compact, beautiful.”

On top of it all, the Su-2 had remarkable resiliency. Hero of the Soviet Union M. Lashin: “I flew the Su-2. It is a light plane, flies well, maneuverable, extremely durable. It took [a] long time for the Su-2 to burn. It never burst into flames like a torch.” Hero of the Soviet Union V. I. Strelchenko: “The Su-2 did not burn even when its fuel tank was damaged—the carbon dioxide defense helped.”

On June 22, 1941, the German army delivered a sudden crushing blow to the Red Army. This happened at the point of time when the Su-2s were just beginning to be delivered to the troops en masse. By June 22, 1941, about six hundred Su-2s were produced and delivered to eight air regiments located in the western border military districts. However, many aircraft were still parked at the plant airports and on their way to the places of deployment. On November 19, 1941, a decision was made to stop Su-2 production.⁴ An output of 100,000 to 150,000 was planned, but only about eleven hundred were produced. After the war, historians explained this by saying that the Su-2 was obsolete, so production was stopped. This explanation is surprising. How could it be that the outstanding designer Sukhoy created an airplane that became obsolete in the following year? How could a plane become obsolete if there is no other plane in the world that can compare to it in terms of firepower?

Airplane designer V. B. Shavrov wrote the fullest and the most objective history of the development of Soviet aviation. All other designers were his competitors, so Shavrov was not frugal in criticizing them. But he did not criticize the creators of the Su-2: “[I]ts creators cannot be reproached for anything; the plane corresponded to realistic demands that appeared only until the war [started].”⁵ In other words, everything was good, there was nothing to reproach the designers, before June 21, 1941, the Su-2 corresponded to demands, but at dawn on June 22 it no longer could satisfy those demands. How are we to understand this?

The tale of the Su-2 began five years before the German invasion. In the summer of 1936 Stalin gathered airplane designers at his dacha, greeted them with hospitality, and then gave them the task to construct an airplane under the codename “Ivanov.” Many groups simultaneously worked on Project Ivanov, including some under the command of Tupolev, Neman, Polikarpov, Grigorovich, as well as the design teams of Petlyakov, Sukhoy, Arkhangelsky, Myasishchev, Mikoyan and Gurevich, Lavochkin, and Grushin. In other words, almost all the Soviet airplane designers were concentrated on fulfilling this one single request. And do not think they cooperated. On the contrary: there was harsh competition—only the strongest would win, and all knew “Comrade Ivanov” had plenty of whips and rewards. The Su-2 was the one plane that Stalin placed his stakes on in the upcoming war, which he constantly described as necessary and unavoidable. What did the customer need in his order?

If Stalin had intended to avert World War II, he would have needed a strategic bomber in order to take away the potential aggressor’s desire to invade. But Stalin already had a strategic bomber. Remember, this was the same year, 1936, when Petlyakov finished working on the TB-7. If Stalin was intending to avert war, he had no need to gather designers and to put before them the task of creating a new airplane: he simply should have issued an order to start series production of the TB-7. But he did not do this. Stalin did not need an airplane to avert war. So, Stalin was not going to give an order to start producing such a plane in series. Or, actually, he issued such an order four times, and repealed it four times as well.

If Stalin was preparing for a truly defensive war to protect the Motherland, then he should have ordered his designers to create the best fighter in the world, capable of defending the skies over the Soviet Union. But this did not interest Stalin either. Nikolay Polikarpov was among those present at Stalin's dacha. He was a great designer of fighters: he had already created the I-15 and I-16 fighters. The I-15 was unequalled in its horizontal maneuverability. It was this aircraft that pilot Vladimir Kokkinaki used to set a world altitude record of 14,575 meters on November 21, 1935. And the I-16 opened a new page in the world development of aviation: it was the first mass-produced high-speed monoplane in the world. In 1936 Polikarpov was already working on even more powerful machines: he had the lead in the world race for the best fighter. Stalin should have left Polikarpov alone, not bothered him and not distracted him. Polikarpov knew how to make fighters; his pace should not have been interrupted. There was a race on, and every hour, every minute was worth its weight in blood. But no: Stalin ordered Polikarpov to drop all his work on creation of a fighter and start developing a light bomber, the Ivanov. Stalin was not very interested in fighter planes for a defensive war.

So, what was the ideal combat plane that Stalin had in mind, for the development of which he engaged all his best designers, all the creators of fighters as well as bombers? Stalin himself explained the demand thus: "*samolyot chistogo neba* [a clean sky aircraft]"—a light bomber designed to operate free of enemy resistance. From the creators of the Ivanov plane Stalin demanded neither record speed, nor record altitude, nor record range. Stalin was satisfied with the speed of 375 km/h near ground and 460 km/h up in the sky. Record-breaking characteristics were not required. Stalin demanded only simplicity, durability, and firepower. Stalin's plan was to create a plane that could be produced in numbers surpassing all warplanes of all types in all countries of the world combined.

The name of the plane, Ivanov, had one more significant feature. Ivanov was not only Stalin's secret nickname, but also the most common Russian name. "Stalin formulated the task in the following way: the plane must be very simple to produce, so that there could be as many planes as there are people in our country with the name Ivanov."⁶ So, Stalin planned to produce the largest series of planes in human history. But this was not a plane for defensive war. This was an aggressor airplane. Stalin planned, literally, to build as many light bombers as there were small but mobile horsemen in the hordes of Genghis Khan.

Pavel Osipovich Sukhoy fulfilled Stalin's demands to the highest level. He won the contest. Sukhoy's Ivanov was launched into production immediately, in two factories. Then it began to be produced at a third factory. Additionally, factories that produced other types of planes were ready upon orders to switch to making the Ivanov. In 1940, after the new indexing system was introduced, Sukhoy's Ivanov was named the Su-2 in honor of its creator.

A question arises: If on Stalin's orders 100,000 to 150,000 light bombers had been built, would not all the neighbors have been frightened? Stalin foresaw such a danger. Therefore, he did not plan the mass production of the Ivanov in peacetime. During the secret mobilization of 1940 through the first half of 1941, a small (in Soviet terms) series was produced—only several hundred of these planes. The objective of this series was to open the production line, gain experience, fly the planes, and test them in small conflicts. These first several hundred were meant to be used in the first strike, especially in secondary locations or combined with other aircraft that had higher speed. After the first sudden strike, it was planned to begin a mass production of the Ivanov, by the thousands. The Ivanov was

like an invisible mobilization reserve. It was the same as the situation with the PPSH submachine gun. The PPSH—the Shpagin submachine gun—was created before the war, tested, and approved. The war began and immediately every workshop, every plant that produced hardware, every small-scale factory began producing the most simple, reliable, very powerful weapon in inconceivable quantities. Stalin planned to proceed exactly the same way with the Ivanov airplane. Immediately after carrying out the first strike, Soviet aviation industry was to begin a mass production of the Su-2.

Here the question of defense arises. A relatively slow bomber, acting above the battlefield and adjacent enemy territory must be protected by fighters. If Stalin planned to simultaneously launch production of a corresponding number of fighters for cover, the light Su-2 bombers could have been used in any situation, for example for deflecting aggression. But there was no order for fighter planes in such quantities; therefore there was only one possible way to use the Ivanov Su-2 planes in war: to attack the enemy first and neutralize his aviation. Using large masses of such planes is impossible without crushing the enemy's air bases first. This is why Stalin's plan to produce a minimum of 100,000 light Su-2 bombers was equivalent to a decision to start the war with a sudden strike against the enemy's air bases.

In order to picture Stalin's plan, we must imagine ourselves on the shores of the Hawaiian Islands in December 1941. It is a bright sunny morning. The American fleet is in its harbor. Suddenly, the first wave of Japanese bombers, fighters, and torpedo-planes arrives. The first wave consists of 183 planes. Less than a quarter of these are fighters for cover. A powerful cover is not needed in the given situation. The calculations are based on the premise that American fighters will not have time to get off the ground and deflect the sudden strike. The Japanese air armada consisted mostly of attack planes—the bombers and torpedo-carriers Nakajima B-5N1 and B-5N2. There was nothing remarkable about the design and characteristics of the B-5N aircraft, but in a sudden attack it was awesome. In appearance, size, and flight characteristics, the Nakajima B-5N resembled a fighter more than a bomber. This gave it the ability to fly so low above its target that the faces of the pilots could be seen from the ground and the ships, so low that there were almost no misses when its lethal cargo was dropped. The Nakajima B-5N was a monoplane, with a low wing configuration and one radial two-row engine equipped with an air-cooling system. In some planes the crew consisted of three men: pilot, navigator, and gunner. But in most, it was only two: the planes were used in tight formations, like swarms of enraged bees, so there was no need for every plane to have a navigator. The bomb load of the plane was less than a ton, but each drop was made at point blank range. The B-5N had relatively weak defense weapons—one or two machine guns to defend the hind hemisphere. These planes did not need much defense weaponry. These were planes for sudden attack, “planes of clear sky,” a sky in which there are either very few enemy planes or none at all.

The light bomber Nakajima B-5N worked very well at Pearl Harbor, but its heroic days were over after that. The sudden attack was insufficient to take the American fleet and aviation out of the war for long. In consequent battles, when the Americans recovered, when regular war began without stabs in the back, the B-5N did not show any particular usefulness. Production of these planes continued for some time. Overall there were over 1,149 of them produced, and on that their history ended.⁷ The B-5N was created for a situation when nothing hampered its work in the sky. The B-5N was frightening to the weak and defenseless, frightening in groups, frightening during a sudden attack. It was frightening like a pack of

ferocious, bloodthirsty hyenas that do not have remarkable strength or speed, but have powerful fangs and act in groups against a victim weaker than they are, against him who does not anticipate attack and is not prepared to deflect it.

What does all this have to do with the Soviet plane Ivanov Su-2? The Ivanov was almost an exact copy of the Japanese air aggressor. In the summer of 1936, nobody could have predicted what would happen at Pearl Harbor five years later. In the summer of 1936, the Nakajima B-5N did not yet exist. There were only plans, which the Japanese did not announce. Therefore, it was impossible to suppose that Soviet designers were copying the Japanese. Copying demands time, and even if it had been possible to steal technological documentation (which would have meant mountains of papers), even then the translation (from Japanese!) would have taken several years. The Nakajima B-5N in Japan and the simultaneous varieties of the Ivanov plane in the USSR were created almost in parallel: the first flight of the B-5N was in January 1937, and the first flight of the Ivanov was on August 25 of the same year. Therefore, we are not talking of copying, but of two very similar yet independent processes of development.

On Stalin's orders, several variants of the Ivanov airplane were created. Each designer jealously guarded his secrets from his competitors, but every Soviet designer came up with the same winged hyena: a light bomber, bearing more resemblance to a fighter in appearance, size, and flight characteristics. Every Soviet designer chose the same scheme independently from his competitors: a monoplane with a low wing location, one radial engine in a dual row, with an air-cooling system. This is no miracle. It's just that all the designers were given one task: to create an instrument for doing the same job. Since the job was the same, the instruments created by different designers to perform it were also quite similar.

In the summer of 1936 the Nakajima B-5N had not yet flown once, and there was little information known about it. There was nothing record-breaking about the design of the new Japanese airplane, nothing that could have attracted Stalin's attention. But in 1936 Stalin was already thinking in the same terms as the Japanese admirals. In 1936, Stalin ordered his designers to create the same type of airplane that one beautiful morning would suddenly appear above the enemy, at a moment when the enemy does not anticipate an attack. This was the exact same scenario Stalin planned to use to enter World War II.

A relatively slow-speed plane can be a horrific weapon. Hitler subscribed to the exact same school of thought. He had his own winged jackal—the Ju-87. This was a single-motor plane, which bore more resemblance to a fighter than to a bomber. The crew of the plane was two people. Its defense weapons were weak: one machine gun to defend the rear hemisphere and two wing-mounted machine guns. The bomb load was less than one ton.⁸ It was of that generation of airplanes that did not pull up their gear during flight. It had a laughably slow speed. But groups of ten Ju-87 carried out sudden raids against sleeping air bases and with these raids they cleared the skies. After the first strike against the airbase, they flew above the enemy's territory in complete calm and did not need record speed, since there was nobody to chase them. The Ju-87 ruled above Poland, Norway, and France. In Britain it encountered resistance. It was impossible to crush the British air bases with a sudden attack—the conditions were not fit for carrying out surprise raids. After participating in several raids, the losses of Ju-87 were so high that an order was given to stop using them above the British Isles.

In the spring of 1941 came the Yugoslavia and Greece campaigns. The Ju-87 delivered a sudden strike and once again they were successful and loved. In May they carried out a

blow to Crete. Here they encountered British troops, but the strike was a surprise, so the Ju-87 once again became the symbol of Blitzkrieg, success, and victory. In June came a sudden attack on Soviet air bases. On a beautiful sunny morning, the German air force secured for itself a clear sky and could use airplanes of any model—there was nobody to be afraid of.

The Ju-87's rule lasted until the time when Soviet aviation gained strength. In the second half of the war, the Ju-87 was being used more and more rarely on the Soviet-German front, until it completely disappeared. "During the course of the eastern campaign, the loss of air superiority during a short time put in question the usefulness of using [the] relatively slow and not maneuverable dive-bombers Ju-87."⁹

The Ivanov was created later than the Ju-87. Therefore, the Ivanov's characteristics were higher, and in terms of designs the two planes had significant differences. But in spirit and general idea, in their assigned roles, the Ju-87 and Ivanov are twins. The plane Nakajima B-5N and the Ivanov are brothers, not just in idea and spirit, but in their main characteristics as well.

The planes for sudden attack did not need record-breaking characteristics. Stalin's logic is clear and simple: if a sudden attack can take care of the enemy's air bases and clear the sky of enemy planes, we will need a simple airplane with powerful weapons that can be mass produced; the most important of its designated uses is to give support to our advancing waves of tanks and paratroops, creating an air terror above defenseless territories. This was exactly the sort of airplane Stalin ordered from his designers.

The Su-2 had a tragic fate. In terms of firepower and speed it surpassed both the German Ju-87 and the Japanese Nakajima. But both the Ju-87 and the Nakajima B-5N got a chance to prove themselves in sudden attacks and gain fame. Hitler did not permit the Ivanov to do the work it was primarily designed to do. Hitler carried out a preemptive strike on Soviet air bases, so the Su-2 was left without the work for which it was created. The Su-2 was not needed in a defensive war. Some factories that were preparing the mass output of Su-2s (for example the Kharkov aviation factory) fell into enemy hands. Although some of the production equipment was evacuated, the production pace was lost. The Su-2s produced earlier suffered great casualties: they had little speed and could not escape the enemy when chased. They had weak defense weapons and could not fight off the fighters. Also, there were no Soviet fighters to give the Su-2 cover.

In a defensive war, fighters are needed first and foremost. Aviation designer S. A. Lavochkin urgently needed a powerful, reliable engine for the modernization of the LaGG-3 fighter, and he needed it in huge quantities. No problems arose—industry was prepared to produce the M-82 engine, which was meant for the Su-2 (as the replacement for the original M-8 and M-88B engines, which did not work as well as expected), in any quantity. Lavochkin installed it, and the renowned fighter La-5, beloved by pilots, was born.

Soviet industry was prepared for the mass production of ShKAS machine guns for many different types of airplanes, but before all for the Su-2. The Su-2 was only produced in limited numbers, but the preparedness of industry was not wasted. These machine guns were simply installed on other types of airplanes. Soviet industry was prepared for the mass production of bombs for the Su-2, and it did produce them. These bombs went to arming different types of airplanes as well. Soviet industry was ready to mass-produce 82-mm- and 132-mm-caliber rocket missiles, and it did produce them. They were used not only in aviation, but in ground artillery as well. In the blink of an eye, the Red Army had thousands of

“Stalin’s Pipe Organs.” The Communists called this an economic miracle, but there was no miracle. Simply during the period of secret mobilization Soviet industry was prepared to produce rocket missiles for the Su-2.

These weapons were much more effective when they armed the Su-2: artillerymen had first to receive information about their targets, while pilots could seek out the targets themselves; artillerymen sent their missiles several kilometers away, without seeing the target, while pilots flew hundreds of kilometers, saw their target and the results of their work; the next wave of airplanes always had the opportunity to finish the unfinished mission of the previous one.

Production of the Su-2 was stopped, but industry continued to produce rocket missiles by the millions. They were simply readjusted to be fired from ground installations and other types of airplanes. Production of 100,000 to 150,000 Su-2 planes was planned for conditions in which the Red Army would deliver the first attack, and nobody would hinder the industry’s work. Hitler ruined Stalin’s plan. But even after losing all the supplies of aluminum, and most of its aircraft and motor factories, the Soviet Union produced 38,729 airplanes, which were incomparably more complex in terms of production—the Il-2 and Il-10. Additionally, tens of thousands of planes of other types, all more complex than the Ivanov, were produced.

One more question: where did Stalin plan to find so many pilots to fly 100,000 to 150,000 Su-2 airplanes? This was not a problem. Stalin prepared an excess of pilots. True, they were trained to fly in clear skies. These pilots were not asked to have high-level pilot skills, to be able to fly at night, or to be able to navigate well in new places and situations. A huge number of Soviet pilots were trained for easy work: take off at dawn, fly in a powerful formation in a straight line, and reach the target. Pilots with this sort of qualification were not needed in defensive war, just like the Su-2 plane they were trained to fly. There were so many trained pilots that in 1942 many of them were given rifles and dropped by the thousands over Stalingrad, to reinforce the infantry.¹⁰

Hitler destroyed the plans of a Soviet invasion, but he did not even have a hint of Stalin’s true might, of the seriousness of his intentions, of how well Stalin was prepared to lead a war of aggression. In March 1939 at the Eighteenth Congress of the Communist Party, Stalin declared: “The aviation arms race in the capitalist countries [has continued] for a number of years and unquestionably presents one of the most characteristic and definitive signs of the inevitable general military conflict.” Stalin was right: in the late 1930s, there was a truly mad race in aviation technology. Military aviation forces in some of the largest Western nations reached two to three thousand aircraft and even crossed that threshold. Germany was far in the lead. The German air force reached four thousand warplanes. In March 1939, it was clear to Stalin that such a number of warplanes signaled the inevitability of a war—exactly as it happened. In that same year, 1939, Hitler began his war for global domination.

If we call three or four thousand warplanes by the term “wild arms race of aviation weapons,” then what do we call the preparations to produce the Su-2? If four thousand of Hitler’s warplanes of all types were enough testimony of the “inevitability of a general military conflict,” then what in that case does the preparation for producing 100,000 warplanes of just one type attest to?

12

About “Obsolete” Airplanes

Air force superiority is on the side of the enemy. The number of our units [that are] active on the front has been drastically reduced.

—CHIEF OF GENERAL STAFF OF GERMAN GROUND FORCES,
COLONEL GENERAL FRANZ HALDER, JULY 17, 1941

From the moment that aviation came into being, the problem of acquiring air superiority—and, ideally, complete air domination—presented itself before military strategists. Without air superiority, victory is impossible. Air superiority can be attained through one of two ways: either destruction of the enemy’s air force on the ground, or through air battles. Usually both of these methods are used simultaneously. However, a commander of any rank unavoidably has to determine, based on the way the situation develops, which of these two methods is his priority at the given moment, and which is secondary. Before the war starts, the military and political high command of the country should clearly determine its position on the given question: which of these methods will be primary, especially in the early period of the war? If the primary method of attaining air superiority is to be the way of air battles, the attention of all designers should be turned to creating fighter aircraft. Designers of fighter aircraft should be given the best production facilities, the best aircraft engines, the most expensive equipment, and the rarest materials. If it is decided to win air superiority through air battles, the best pilots need to be sent to fighter aviation. These fighter pilots should be given the largest part of training resources and fuel, even if it is done at the expense of training other pilots. If, however, we have decided to win air superiority by destroying the enemy’s air force on the ground, then the attention of the designers should be turned to creating planes of an entirely different nature. Low-flying attack planes and light bombers are perfect for carrying out raids on air bases. The low-flying aircraft is not designed for air battle. This plane needs neither record speed, nor altitude, nor maneuverability. This plane has to meet entirely different requirements. It must be well defended from powerful fire from the ground, and must carry its own weapons powerful enough to destroy targets on the ground.

Both methods of attaining air superiority have their advantages and disadvantages. If we decide that the primary method of winning superiority in the air is to be through air battles, then we must be prepared for large losses of planes and pilots, and for prolonged, exhausting battles. The training of fighter pilots is a risky venture that requires a lot of time and huge expenditures. This method of winning superiority in the air has only one advantage: it is universal; it can be used in any situation. If we decide to win air superiority through destruction of the enemy's air force on the ground, the task can be accomplished quickly. During the course of one day or even just a few hours, we can secure not just superiority but total domination. All this can be accomplished with just one sudden, powerful raid, and no exhausting, prolonged air battles would need to follow. And we would not need to spend tremendous resources on training pilots. Even pilots of relatively low qualification are good for this job. They do not need to learn tricks. It is enough to teach them how to take off and land, to follow a route, and to shoot at stationary targets on the ground. This scenario has only one drawback: it can only be used against an enemy who is not awaiting an invasion.

Before and during the war, the Soviet Union designed quite a few remarkable and at the same time very simple airplanes. But the best achievement of the Soviet air force was not in designing airplanes that destroy enemy planes in the air, but in creating airplanes that destroy enemy planes and other targets on the ground. The Il-2 was the highest Soviet achievement in aviation technology during World War II. Air bases were its primary target. The Il-2 was a unique armored low-flying attack plane. We are not talking of armor sheets, which add a shield to a plane, but of a purely armored body up to 12 mm in thickness. The strength of this armor was reinforced by the fact that its details had a rounded shape. The problem of transparent parts was also solved. When bullets hit the front glass of the Il-2, they left only insignificant cracks, even when the fire came from extremely close ranges. The secret was the use of armored glass 63 mm thick.

The Il-2 was the only armored plane in history, a true flying tank. The crew cabin, engine, and fuel tanks were all covered with armor. Only the wings, the tail part of the fuselage, and the tail unit were left unshielded. Aside from the armor protection, a unique survivor rate, and remarkable body characteristics, the Il-2 had extremely powerful weapons: eight rocket missiles, two 23-mm automatic cannon that fired at 550 rounds per minute, two machine guns with a world-record firing rate, and 400 to 600 kilograms of bombs.¹

When creating this attack airplane the designer, Ilyushin, included a small defensive detail as well. The early model of the Il-2 was a two-seater. Pilot and gunner sat back to back: the pilot flew the plane and destroyed targets on the ground, while the gunner, with a .50-caliber machine gun, covered the hind hemisphere from attacking enemy fighters. Stalin personally called Ilyushin and asked to have the gunner with the machine gun removed, and make the Il-2 a one-seater. Stalin ordered the entire decrease in weight to be used to enlarge the bomb load and the fuel tank. Stalin needed the Il-2 for situations in which not a single enemy fighter would have the time to get off the ground.

The changes in design took several months. The problem was that the technology used in producing the Il-2 was extremely complex. The cabin was assembled from over twenty armored parts, which had a double bend, like fragments of a broken mug. The entire technology for producing the armored fuselage had to be replaced. This delayed the beginning of mass production of the Il-2. By the time of the German invasion, only 249 of them had been produced.

But Hitler did not have a single comparable plane. And the rest of the world had nothing comparable. Not a single nation in the world succeeded by the end of the war in creating anything equal to what the Red Army had at its beginning. Stalin had “only” 249 Il-2 planes, but Soviet industry was ready to produce them in any quantity. Even after the losses in the second half of 1941 of the greater part of aviation and motor factories, after the loss of all factories that produced aluminum, the Il-2 was still produced in the largest-scale series in the history of world aviation. The Il-2 did not become obsolete until the very end of the war, and entered history as the most mass-produced warplane of all time.

The Il-2 carried huge losses. The low-flying attack plane was not designed for air battle, and following Stalin’s orders it had no defensive weapons. Several days after the German invasion, Stalin personally called Ilyushin and demanded that the Il-2 be produced again as a two-seater: in defensive war, even an aggressor airplane needs to have defensive weapons. However, it was already impossible to return to the original designs without stopping production. And it was impossible to stop production. Therefore, the plane continued to be made as a one-seater. The Il-2 delivered a huge amount of destruction to the enemy, but it also was quick to perish. If the Il-2 had also had a rear gunner protecting the hind hemisphere, the Red Army in no time would have had thousands of armed airplanes of this type. Each of them could have completed tens and even hundreds of raids. The Il-2 attack-planes alone could have turned the tide of war. But there was no gunner, so in the early period of the war the Il-2 planes perished by the hundreds and thousands. In the years 1941 and 1942, an Il-2 plane in action could reasonably be expected to last only ten or thirteen flights before it was destroyed.²

Only by the end of 1942 was there some success in changing the finalized design of the plane. The Il-2 was once again produced as a two-person plane. Now the plane had a gunner with a large-caliber machine gun. However, this was still only a half-valid solution. There was never a return to the original design. The shooter’s cabin was added outside the armored compartment.³ The pilot was safe behind the armor, while the gunner was just covered by plywood. Of course he deflected the attacks of enemy fighters that came up from the tail, but he quickly perished himself, and then the Il-2 once again became defenseless. The best pilots trained before the war perished in the first months of war due to a lack of defensive weaponry on the Il-2. When defensive weaponry was finally installed on the planes, Il-2s were already operated by war-time pilots, trained in very specific ways. One of my mentors at the Military Academy, Air Force Major General Alexander Kuchumov, Hero of the Soviet Union, had arrived at the front in 1942. He had standard war-time training behind him—an hour and a half of flight time on the Il-2. The unique attack plane, the best of its kind, proved to be a particularly effective weapon. But it could have yielded even better results had well-trained pilots flown it. A few of the war-time trainees who survived became masters of their craft, heroes, and generals. And thousands perished after just a few missions.

But the problem was not that there were too few Il-2 planes. And the problem was not that they were bad planes. The problem was that the design of the plane was dictated by strategy, and the strategy was that of a sudden attack against the enemy’s air bases, after which the plan was to continue the war without resistance from the enemy’s air force. The Il-2 had to be used in a defensive war, when the enemy had air superiority. But this great airplane was created for an entirely different kind of war.

Stalin had a dive-bomber, the Pe-2. Hitler had good airplanes, but the Pe-2 surpassed any of them, in all the major characteristics. For example, the Pe-2 had a top speed of 75 km/h more than the best German bomber, the Ju-88, and 100 km/h more than the He-111. Prior to June 22, 1941, 490 Pe-2 planes had been produced,⁴ more than all the Ju-88s positioned on the entire Soviet-German front.

Stalin had three types of new fighters—the MiG-3, the LaGG-3, and the Yak-1. Each of them was equal or superior to the best German models. For example, the MiG-3 had a speed of 628 km/h at an altitude of 7,000 meters. Hitler had nothing similar in 1941. On June 22, 1941, Hitler had 1,129 fighters of all types on the Soviet-German front. Stalin had 1,309 of the newest MiG-3 model fighters alone.⁵ On top of this, Stalin also had 399 of the newest Yak-1 models and 322 LaGG-3s.⁶

Germany mastered the following air forces for the purpose of waging war against the USSR: 3,520 war planes of all kinds (bombers, fighters, reconnaissance, transport, and communications aircraft), plus 307 Finnish planes, 393 Romanian, 48 Hungarian—a total of 4,268 planes.⁷ The total number of aircraft available to Germany on June 1, 1941, was 6,852, including 823 reconnaissance planes, 2,017 single-engine fighters, 232 double-engine fighters, 2,141 bombers, 501 dive-bombers, 719 transport planes, 133 communications planes, and 286 planes belonging to the Navy.⁸ But Germany was simultaneously fighting on many fronts, from the North Atlantic to the Egyptian border.⁹ Against Stalin, Hitler could only send 2,510 airplanes, including the Hs-123, which had a speed of only 338 km/h, and assorted types of aircraft used for transport, communications, and medical purposes.¹⁰

Stalin had 2,769 of the newest models Il-2, Pe-2, MiG-3, Yak-1, and LaGG-3. But that was not all: Stalin did not just have five new types of planes, he had twelve. He also had the Ar-2, Er-2, Su-2, Pe-8, Yak-2, Yak-4, and Il-4. The Er-2 bomber had a range of 4,000 km. Hitler did not have such a bomber until the very end of the war. The Soviet bomber DB-3f (Il-4), released in 1940, had a range of 3,300 km with M-88 motors and a normal bomb cargo, while the Il-4, released in 1941 and equipped with M-88B motors, had a range of 3,380 km. Hitler did not have this kind of aircraft either. On September 7, 1936, Ilyushin's DB-3 bomber raised 2,000 kg to an altitude of 11,005 meters. This record (among others) was officially registered by the FAI (*Fédération Aéronautique Internationale*) and remained a record throughout the entire war. Not a single dual-engine airplane in the world could repeat this performance. This record was beaten only after the war, in 1946, and not by the B-17 "Flying Fortress" but by the four-engine "Super Fortress," the B-29. How many bombers did Stalin have? The DB-3fs alone, on June 22, 1941, numbered 1,846. This is more than the number of all types of bombers used by Hitler to attack the Soviet Union. In other words, Stalin had more of the newest planes than Hitler had new and old ones combined.

Of course, Stalin had obsolete planes as well. Aside from the twelve newest models, Stalin also had the TB-3 and SB bombers, and the I-16 and I-153 fighters. There is something to be said for these airplanes. Stalin had 541 four-engine TB-3 bombers.¹¹ Historian V. B. Shavrov said: "This airplane of A. N. Tupolev's design belongs to [the] category of the most remarkable planes not just of their own time period. It was the first four-motor cantilever monoplane bomber with engines that were installed inside the wings. Its design became a prototype for all similar airplanes and planes of various designations."¹² The TB-3 became part of the inventory in 1932. It was produced in series until 1938. In total, 819 airplanes of this type were built. Its crew had eight members. It had four motors. The range of its flight,

with a normal bomb cargo, was up to 2,250 km. Its defense weapons were eight machine guns. Its bomb load was two to four tons. In 1941, all these characteristics placed the TB-3 among the top class of airplanes in the world. What about speed? One must concede that the speed was not too great. In 1932, when the airplane was being integrated into the army, the speed seemed unthinkable, but by 1941 concepts of speed had changed. The maximum speed of the TB-3 was 288 km/h.

Let's compare Stalin's "obsolete" heavy TB-3 bomber with Hitler's best heavy bomber. Well, Hitler did not have any new heavy bombers. (A heavy-bomber development program was cancelled after the 1936 death of its proponent, Walther Wever.) There is nothing to compare with. Then let us compare the characteristics of the "obsolete" TB-3 with the characteristics of the best, though obsolete, German heavy bombers. But Hitler did not have any obsolete heavy bombers either, not a single one. He had, of course, dreams, ideas. He had sample models. But nothing went past the experimental stage, so in 1941 Hitler did not have a single bomber with four engines. Hitler in 1941 did not have a single bomber with a range of 4,000 kilometers. Hitler in 1941 did not have a single bomber with a bomb-carrying capacity of 4 tons. The TB-3 had little speed. But Hitler's heavy bombers had no speed, because they did not exist.

Stalin had the "obsolete" SB bomber (mid-range). At approximately the same bomb load and range of flight, the SB surpassed the German Ju-87 bomber by about 70 km/h.¹³ By June 22, 1941, the Germans had deployed 324 Ju-87s as a part of their assault against the Soviet Union; Stalin had 6,656 SB planes.¹⁴

On top of the newest fighters, Stalin had the "obsolete" I-16. The situation on June 22, 1941, was that the air force of the western border regions of the USSR alone had at its disposal a total of 4,226 fighters, of which 1,635 were I-16s. Add to that another 344 I-16s in the air forces of the Northern, Baltic, and Black Sea fleets, to a total of 1,979.¹⁵ Here is what British pilot Alfred Price, who in his lifetime flew in over forty types of airplanes and spent over four thousand hours in the air, thought about this airplane. His opinion of the "obsolete" Soviet fighter: "The most powerful weapon among the series of fighters in the world in September 1939 was possessed by the Russian I-16, which twice surpassed the Bf-109e and almost three times the 'Spitfire-1.' Among all prewar fighters in the world, the I-16 was unique in the sense that it alone had an armor protection around the pilot. Those who think that the Russians were backward peasants before the Second World War and only moved forward under the influence of using German expertise need to remember the facts."¹⁶ To this it must be added that by 1941 the I-16 had not and could not have become obsolete.

Starting in 1937, the I-16 was produced with a cannon and machine-gun armament. The legendary British Spitfire in 1940, during the course of the Battle of Britain, had no cannon. The great American Mustang and Thunderbolt fighters even by the end of the war had no cannon. The I-16 had an amazing lifting power of 553 horsepower per ton of weight. This was a record statistic, and not a single warplane in the world had such power. By the end of the war, not a single plane in the world had reached such a result—the Spitfire Mk-IX and Bf-109K came close, but only when the engine was working in an extreme regime that could not be turned on for longer than seven minutes.

The I-16 surpassed any German fighter and most other airplanes of the world in terms of its longevity. All German fighters had an extremely vulnerable coolant system. If just one bullet hit the radiator, pipeline, pump, or any other part of the cooling system, the liquid

leaked out and the motor overheated and stopped working. On the other hand, the I-16 had a coolant system that was not vulnerable to such direct hits, because it was air-cooled. That engine was based on the American Wright Cyclone design.

The I-16 was inferior to the German fighter in speed. The I-16 type 28 had a speed near ground of 427 km/h, while the Bf-109 E-1 flew at 464 km/h, and the Bf-109 E-3 flew at 540 km/h. At an altitude of 5 kilometers, the I-16 type 29 flew at 470 km/h,¹⁷ while the Bf-109 E-1 and E-3 flew at 532 and 555 km/h, respectively.¹⁸ But the I-16 surpassed the Bf-109 in vertical maneuvers and greatly surpassed it in horizontal maneuvers. The I-16 could do a turn in 17 seconds, while the Bf-109 took 25 seconds. If the German fighter did not wish to engage the I-16 in battle, it could always evade it. The Bf-109 evaded battle using its speed, while the I-16 used its maneuverability.

It's interesting to point out what Germany's own fighter pilots thought of the I-16's capabilities: "The I-16, with an able pilot inside, was a dangerous enemy. German pilots did not at all consider the I-16 an easy target. Even though they could almost always win the initiative in air combat against the *Ishachok* ("little donkey"—a Russian nickname for the I-16), the pilots tried to avoid maneuver-based combats against Russian veterans. Among themselves, the Germans used to say that one should not corner a rat, referring, of course, to the plane's nickname, *Rata*, earned on the Spanish front. If the Messerschmitt pilots did not follow this principle, the fight could turn out very badly for them indeed."¹⁹ From 1934 to 1942, 10,292 I-16 units were produced. This number includes 3,189 I-16 type 15s (UTI-4), the training versions of the aircraft. So the total of combat ready I-16 units produced was 7,103.²⁰

Aside from this plane, Stalin also had the I-153. There were 3,437 of them produced. This plane had lower speed than the I-16, but it had phenomenal maneuverability. It climbed to a height of 5 kilometers in exactly a minute less than the Bf-109. The I-153 did a turn in 12 seconds. It had time to make two full turns faster than the Me-109 did one.

Why then in the first stage of the war did the Soviet air force lose air superiority from day one? Why did the Germans have the advantage in the air, given that their air force lost out to the Soviet air force both in plane quantity and plane quality? The answer is simple: the majority of Soviet pilots, including fighter pilots, were not taught the dogfights. Soviet aviation was oriented to conduct one grandiose, sudden, aggressive operation, in which the Soviet air force in one raid would crush the enemy's air force on the ground and claim air superiority. Already in 1929 in the Soviet journal *Voyna I Revolutsia* (War and Revolution), the fundamental article "The Early Period of the War" made the conclusion that was later repeated by Soviet air force directives, including ones from 1940 and 1941: "It seems to be extremely advantageous to show initiative and be the first to attack the enemy. He who exhibits initiative by attacking his enemy's air bases with his air force can later count on air superiority."²¹

Precisely for this reason Soviet aviation in 1941 was concentrated along the borders. The field air base of the 123rd fighter air force regiment, for example, was located only two kilometers away from the German border. In a war situation, this saves fuel during takeoff in the direction of the enemy. In the 123rd regiment, just like in many others, the majority of altitude gain after takeoff was to be acquired over German territory. Ten years after these events, Major V. Khmelev, then an eyewitness, described them: "The bomber aviation air bases [were] located no further than 80 km from the new German-Soviet border. It was at that time clear to every Soviet soldier and officer that the entire Red Army was feverishly

preparing for aggressive operations of unheard-of dimensions.”²² But Hitler attacked first, and from the first day of the German invasion many Soviet air bases found themselves under the tracks of German tanks. Aside from the huge losses in planes, entire air bases—with unbelievable reserves of fuel, ammunition, and other supplies, without which conducting war was impossible—were lost to the enemy.

13

Soviet Airborne Assault Troops and Their Mission

In the battles to come, we shall operate on the territory of the enemy. That is prescribed by our rules.

—COLONEL A. I. RODIMTSEV, SPEECH AT THE EIGHTEENTH
CONGRESS OF THE COMMUNIST PARTY, 1939

Airborne assault troops are designed for action in sudden, decisive offensive operations. “The use of paratroops is pointless unless they are part of an offensive operation,” said one military newspaper in 1940.¹ *The Field Rules of the Red Army for 1936 (PU-36)* states: use of airborne assault troops can only be made in the course of offensive operations and only in conjunction with regular troops advancing against the enemy.²

The Soviet Union was the first nation in the world in which airborne assault troops were created. They were created in 1930, before Hitler came to power in Germany. Only two other nations developed airborne troops before World War II: Germany, in 1936, and Italy. By the beginning of the war Hitler had four thousand parachutists and Italy had trained seven hundred parachutists.

Stalin took the lead in developing airborne warfare. “By the end of 1933 the Red Army had one air assault brigade, four mobile paratroops units, twenty-nine separate battalions, and several companies that altogether numbered about ten thousand men.”³

At the beginning of the war, the Soviet Union had more than one million trained parachutists, according to the official Communist Party newspaper, *Pravda*, on August 18, 1940. In light of declassified documents it is clear that this was a deliberate underestimation of the real number, which arguably was closer to two million parachutists. Never before had the world seen such large-scale preparations for offensive war. To calm fears of Soviet aggression, *Pravda* lowered the number of Russian paratroopers to one million.

In the 1930s, the Soviet Union went through a true parachute craze. In less than two years (from April 1934 until February 1936), 427,000 parachutists were trained in Ukraine alone.⁴ Not a single city park was without a parachute tower, and a parachutist’s badge became a necessary symbol of manhood for all young men. However, it was not easy to earn it. The

badge was awarded for jumping out of an airplane, but only to those who beforehand had completed tests in running, swimming, shooting, throwing hand grenades for long distances and with accuracy, climbing obstacle courses, learning to use gas masks, and other military tests. Jumping from an airplane was the culmination of the training of an airborne soldier.

In the 1930s, western regions of the USSR were shaken up by grandiose military maneuvers. Only one theme was developed in each maneuver—"Deep Penetration"—a sudden attack by gigantic masses of tanks deep into "enemy" territory. The scenario always simple but menacing. In all training exercises, the sudden attack of land troops was always preceded by a surprise attack of Soviet aviation on the "enemy" air bases. This was followed by a drop of the paratroops to take over the air bases. Following the first wave of parachutists, a second wave of assault troops, with heavy weapons, landed on the air bases.

In 1935 at the Kiev military district training maneuvers 1,200 paratroopers were dropped, followed by the landing of 2,500 assault troops with heavy weapons, including artillery, armored cars, and tanks. In 1936, in Byelorussia, the same invasion technique was practiced. A parachute force of 1,800 men was dropped and followed by 5,700 assault troops with heavy weapons. In the same year, during attack maneuvers in the Moscow military district, the 84th Rifle Division was fully deployed by airborne transport. In 1938, six new air assault brigades—the 201st, 202nd, 204th, 211th, 212th, and 214th—were created.⁵ In total the six brigades consisted of 18,000 men.⁶

In 1939, Stalin ordered the destruction of guerrilla warfare bases and partisan units that were designed for action on Soviet territory in the event of enemy aggression. Instead, Stalin ordered the formation of new paratroop forces. In the Moscow military district three regiments consisting of three battalions each and several separate battalions, five hundred to seven hundred parachutists each, were formed.⁷ In April 1941 five air assault corps were secretly formed in the Soviet Union.⁸ All the corps were stationed in the western regions of the Soviet Union. Each corps included an administration, staff, service formations, three air assault brigades, an artillery battalion, a separate tank battalion (of fifty-four tanks), and other formations. Each corps numbered 10,419 men.⁹

Twice awarded the title of "Hero of the Soviet Union," Colonel General Alexander Rodimtsev, who in May 1941 was commander of the 5th Air Assault Brigade of the 3rd Paratroops Corps, testified about those events in his memoirs. At that time, Rodimtsev was a colonel with combat experience in Spain, where he had received his first Hero of the Soviet Union medal. Rodimtsev recalled:

I had to serve with excellently trained warriors, the best of our Soviet youth. . . . The officers were mostly experienced parachutists: each of them [had] made from fifty to one hundred jumps. The brigade consisted of four separate paratroops battalions, a separate artillery battalion, a sergeants' school, a separate reconnaissance company, a separate machine gun company, [and] a separate communications company. The brigade was fully equipped with weapons and necessary supplies, as well as parachutes. An excellent collective of officers, disciplined and friendly. Later my first impression was confirmed. Every one of them showed extreme courage and selflessness in battle for the Motherland. The brigade trained according to schedule. . . . I was pleased by the hard-working nature of my parachutists, their courage and their will power, which was easy to feel amongst that confident youth. . . . All the time was used for preparations for jumps and [for the] jumps themselves.

Stalin, a terrorist and robber from the Caucasus also known as Koba, Ivanov, Vassiliev, Chizhikov, Ivanovich, Dzhugashvili, Bessoshvili, Salin.

The coat of arms of the Union of the Soviet Socialist Republics. There are no borders on the map because the whole world was to become part of the Soviet Union through wars and revolutions.

The Palace of Soviets was supposed to be the tallest building in the world at five hundred meters high. It was designed for the ceremony of accepting new republics joining the Soviet Union, but in 1941 construction was halted and the frame dismantled. The steel beams were used to construct anti-tank defenses near Moscow.

Joachim von Ribbentrop signs the Molotov-Ribbentrop pact dividing Poland between the Soviet Union and Germany. Hitler was not aware that France and England would declare war against Germany after he attacked Poland. But Stalin knew it. It was part of his plan for the conquest of Europe.

Stalin shakes Ribbentrop's hand. Next to Stalin is Marshal Shaposhnikov, Chief of Staff of the Red Army, who coined the slogan, "Mobilization is war." On August 19, 1939, Stalin ordered secret mobilization.

Ribbentrop brings great news to Hitler: "We can start the war against Poland." They do not realize they have fallen into Stalin's trap.

Soviet and German officers looking at maps dividing Poland after the invasion, September 1939.

NKVD and SS officers, now brothers in arms after the division of Poland.

Traditionally, history presents Stalin as a victim of Hitler's aggression. But at the time of the signing of the pact in August 1939 the world saw them as equal villains. Bulgarian cartoonist Ivan Beshkov saw them with daggers drawn against each other.

German General Hans Guderian exchanges smiles with the Soviet Commander S. Krivosheev at a border meeting dividing Poland. Note how the officers keep their hands behind their backs as in the cartoon. Krivosheev ended the war in 1945 in Berlin as a lieutenant general of Soviet armored forces.

On September 28, 1939, a detailed map of the division of Poland was signed by Stalin and Ribbentrop. Stalin wrote the first letters of his name then stopped and continued again with larger letters, unable to hide his excitement. Stalin, who held no state office at the time, should have let Molotov, the foreign minister, sign.

On September 29, 1939, Nikita Khrushchev, then a Politburo member, inspected the new border on the river San. General I. Tyulenev, accompanying Khrushchev, wrote that Khrushchev said, "Let the Germans do their evil crimes and then we will come as liberators."

The Soviet official map of the German war against Poland with the territory occupied by the Soviet Union left unmarked, as if there was no Soviet participation in the war against Poland.

Soviet troops preparing for the “liberation” of Europe. It is difficult to distinguish them from German troops.

Soviet oil delivery to Hitler. Without Soviet supplies of oil, cotton, grain, magnesium, chrome, copper, tin, nickel, vanadium, wolfram, and molybdenum, Hitler would have been unable to conquer Europe.

The Soviet BT tank, with high speed, high maneuverability, and light armor. A new tank for a new kind of warfare: lightning offensive operations. It was of limited use in defensive warfare.

The amphibious T-40 tank. The Soviet Union was the only country in the world which by 1941 had amphibious tanks, which can be used only in an offensive war.

The KV-1 heavy tank. The Soviet Union was the only country in the world which by 1941 had heavy tanks in its arsenal. The Soviet heavy tanks could sustain up to twenty to thirty direct hits from German anti-tank guns. Once these tanks crossed the border nothing could stop them. Hitler was fortunate in attacking at the moment these tanks were still being moved forward on railroad cars.

The KV-2 heavy tank. By the end of June 1941 German frontline officers reported that the Russians had tanks with powerful engines, wide tracks, impenetrable armor, and six-inch guns that used 48-kg (105.6-lb) projectiles. Berlin did not believe these reports.

By 1936 the Soviet Union created the TB-7 strategic bomber, which was capable of reaching altitudes where anti-aircraft fire and enemy interceptors could not reach them. In 1942 the Soviet foreign minister, Vyacheslav Molotov, used a TB-7 to fly over German occupied territories without fear of being attacked while en route to Great Britain and the USA. The TB-7 had the capacity to carry 11,000-pound bombs. Before 1941 Soviet industry had the capacity to produce a thousand of these planes, but Stalin ordered a halt to mass production of the TB-7. By the summer of 1941 only seventeen of these bombers were built. Stalin had decided he did not want to destroy European cities, factories, and ports; he wanted to seize them undamaged and for that purpose he needed different aircraft.

The 212th Air Assault Brigade, secretly transferred from the Far East, trained next to Rodimtsev's brigade in "conditions that were closer to actual battle conditions." Rodimtsev said its soldiers and commanders each had one hundred and sometimes even up to two hundred jumps, while the commander, Colonel I. I. Zatevakhin had at least three hundred jumps.¹⁰

Rodimtsev's account was mirrored in the memoirs of Colonel I. G. Starchak, titled *Battle from the Sky*, and by General A. S. Zhadov, who in 1941 was a major general in command of the 4th Air Assault Corps.¹¹ Zhadov attested: "All brigade and corps formations were manned with well-trained personnel, supplies, and weapons."¹² All five corps were in a state of full readiness for deployment.

The air assault corps quickly graduated from general battle preparations to very concrete ones. After June 13, 1941, the appropriate orders were issued and the final preparations for war were completed. Tens of thousands of parachutes were folded for action in the loading areas of the airbases. The air assault corps were issued powerful artillery and even battalions of light amphibious tanks. All paratroop corps were stationed so close to the borders that they could be deployed on enemy territory without additional regrouping. All corps conducted intensive preparations for an impending landing. All corps were concentrated in the forests, away from public view. The 4th and 5th Corps could, without regrouping, be used against Germany, the 3rd against Romania. The 1st and 2nd Corps were to be dropped in Germany, Romania, or in Czechoslovakia or Austria, in order to cut off the petroleum routes that ran through the mountains from Romania to Germany.

On June 12, 1941, the Command Staff for Air Assault Troops was created in the Red Army, with plans for an additional five air assault corps to be formed by August 1941. Their creation was decided upon in May 1941.¹³ Aside from the five corps, five separate air assault brigades were also formed. Altogether, in the summer of 1941 Stalin had ten air assault corps (three brigades each), six separate brigades, and several separate regiments.

Aside from the air assault corps, brigades, and regiments, a significant number of parachutist landing battalions were created as units included with the regular Soviet infantry. Marshal Ivan Bagramian relates that in the beginning of 1941 the 55th Rifle Corps, which was located close to the Romanian border, conducted intensive training for several parachutist battalions.

In addition to parachute formations, several regular rifle divisions were also prepared for transfer by air, in those days a radical shift in deployment of troops. On June 21, 1941, the day before Hitler attacked the Soviet Union, the Soviet army was practicing airborne offensive operations, proof of how far they were from any defensive war strategy.

To deliver hundreds of thousands of paratroops the Red Army needed an air armada of transport planes and gliders. Stalin understood this perfectly, which is why the parachute craze of the 1930s was accompanied by a glider craze. Soviet gliders and gliding hobbyists were up to world standards. By the beginning of World War II thirteen of the eighteen world records in gliding were held by the Soviet Union.¹⁴ The best Soviet warplane designers were also busy designing gliders. The future creator of the first satellite, Sergei Korolev, was asked to develop gliders.

The offensive military orientation of Soviet gliding was not disputable. Even before Hitler came to power, the USSR had already created the first cargo glider, the G-63, designed by B. Uralpov. Then the USSR created heavy gliders, capable of carrying trucks. Designer

P. Gorokhovsky created a rubber inflatable glider. After being deployed in the enemy's rear, several of these gliders could be loaded into one transport plane and returned to their own territory for repeated use.

Soviet generals dreamed not only of dropping a multitude of paratroops into Western Europe, but also hundreds, possibly thousands, of tanks. Designers eagerly searched for the most simple and inexpensive ways to realize these dreams. Oleg Antonov, the man who later created the largest cargo warplane in the world, suggested adding wings and empennage (a tail assembly) to a regular tank, using the body of the tank as the fuselage of the hybrid. This system received the name KT—*Krylatyi Tank* ("winged tank"). The gears from the steering were connected to the cannon of the tank. The tank's crew could guide the flight from the tank cabin, by turning the turret and barrel. The KT was amazingly simple. Of course, the flight risk in the tank was, to put it mildly, higher than normal, but human life in the Soviet Union cost less than adding wings to a tank. Before landing, the tank's engine was turned on and the caterpillar tracks launched to maximum speed. The KT landed on its tracks and slowed down. On the ground, the wings and empennage were dropped, and the hybrid once again became a regular tank. Oleg Antonov's winged tank was not ready at the beginning of the war, and since the war did not start the way Stalin had planned, the winged tanks became just as useless as the million silk parachutes folded neatly for an attack against Germany and Romania.¹⁵

The Soviet Union entered World War II with the highest number of glider pilots in the world. In 1939 alone 30,000 people were simultaneously training to become pilot gliders. The pilots' skills frequently reached the highest levels. For example, in 1940 there was a demonstration of eleven flying gliders towed by just one plane. In the late 1930s, more than ten design bureaus in the Soviet Union were competing fiercely to create the best military cargo glider. O. Antonov, aside from the winged tank, created the large military glider A-7. V. Gribovsky designed the magnificent military glider G-11. D. Kolesnikov created a glider for carrying twenty soldiers—KTs-20, while G. Korbula worked on creating a giant glider.

In January 1940, by a decision of the Central Committee (meaning by Stalin's orders) a directorate for the production of military cargo gliders was created within the structure of the Ministry of Aviation, the People's Commissariat (Russian abbreviation—*Narkomat*) of Aviation Industry. The year 1940 was spent on intensive preparations, and from spring 1941 factories run by this directorate began the mass production of cargo gliders. On April 23, 1941, a decision of the Party Central Committee and the Council of Ministers ordered the Commissariat of Aviation Industry to accelerate the production of an 11-seat glider, with a deadline of May 15, 1941, and of a 20-seat glider by July 1, 1941. Stalin and Molotov personally signed the order.

On June 16, 1941, General Zhukov sent out a "Memorandum from the Chief of Staff of the Red Army to the People's Commissariat of Soviet Aviation Industry," # 567240, which ordered 7,500 gliders to be manufactured in 1941–42.¹⁶

The gliders that were produced in the spring of 1941 had to be used in the summer of 1941, or, at the latest, in the early fall. Unlike ordinary warplanes, gliders had light and fragile bodies and wings. They could not be parked outdoors, and all available hangars were already full with previously produced gliders. Keeping a huge cargo glider outdoors, during fall winds and rains, and winter cold and snow, would harm it beyond repair. The mass production of cargo gliders in 1941 meant they were intended for use in 1941. If Stalin had intended to

drop hundreds of thousands of his airborne troops into Central and Western Europe in 1942, the mass production of gliders should have been scheduled for spring of 1942.

Gliders deliver cargo and groups of assault troops without parachutes, while assault forces with parachutes are delivered to the enemy's rear by cargo warplanes. The best cargo warplane in the world at the beginning of World War II was the legendary American Douglas DC-3. This plane set the record for durability—fifty-five years of use. It was an extraordinary plane for its time.

The American Douglas DC-3, although under a different name (PS-84),¹⁷ formed the core of Soviet war-transport aviation. In 1938, the U.S. government sold to Stalin the production license and the necessary amount of the most complex equipment for its production. Giants like Fokker and Mitsubishi also purchased licenses for the production of Douglas aircraft, but could not produce them in mass without parts from America. Soviet industry, on the other hand, was able to start mass production using Soviet parts—an important step in the field of cargo aircraft. Before the war, the Soviet Union bought twenty Douglas units from the United States, and in 1939 six identical aircraft were produced on Soviet soil. In 1940, fifty-one aircraft were produced; in 1941, 237 aircraft. During the entire war 2,419 DC-3s or Soviet PS-84/Li-2 planes came out of Soviet factories.¹⁸

Aside from the DC-3, the Soviet Union had several hundred TB-3 strategic bombers, which could also be used as cargo planes.¹⁹ All large-scale drops of paratroops in the 1930s were done from the TB-3. There were enough of them to lift several thousand paratroopers and heavy weapons, including tanks, armored cars, and artillery.

A Soviet air armada of gliders and transport planes would be easy prey for enemy fighters if they did not secure complete air superiority. Soviet generals understood all this perfectly. The most important document that guided the actions of the Red Army in war was the Field Order (*Polevoy Ustav*—PU). At that time, the Field Order of 1939 was in action—PU-39. The order clearly stated that to conduct a “deep penetration” and a mass drop of air assault corps, the Soviet air force must dominate the skies. This field order, as well as air force battle orders and “instruction on independent use of aviation,” foresaw the conduct in the beginning of the war of a massive strategic operation that would crush the air force of the enemy. According to the plans of Soviet commanders, the air forces of several fronts, naval aviation, and fighter aviation were to participate in such an operation.

In December 1940 the highest-ranking commanders of the Red Army, at a secret meeting with Stalin and members of the Politburo, discussed these operations in great detail. The euphemism for a Soviet surprise attack on German air forces was “special operations at the initial stage of war.” The commander of Soviet aviation, General P. V. Rychagov, stressed the necessity of carefully concealing the preparations of Soviet aviation for carrying out a surprise attack, in order to “find all enemy air forces on their bases.”²⁰ Obviously, it would be impossible in a wartime situation to “find all enemy air forces on their bases.” It is only possible during peacetime, when the enemy does not suspect any danger. It is impossible to first start a war and then carry out a surprise attack on the majority of enemy air bases. It is possible to carry out an attack during peacetime, but such an attack will mean war.

Stalin created so many air assault troops that it was possible to use them only in one scenario: an air attack and a massive invasion. The Red Army had to begin the war, suddenly and treacherously, by an attack of its air force against the enemy's air bases. Thousands of paratroops would be dropped to seize and control key bases and strategic sites. Any other

scenario was not viable. Instead, it was Hitler who carried out a preemptive strike. The Communists' strategy to strike the first blow was aborted. Stalin's carefully designed plans to mount a massive offensive air assault became irrelevant in the desperate rush to fight a defensive war.

For many years after World War II it was not clear what had happened to the Soviet airborne forces. A Western military historian writing in 1978 noted: "In June 1941, when Germany invaded Russia, the latter had more than one million trained parachutists. It seems extraordinary that the investment this represented was not used constructively during the war."²¹ For Soviet paratroopers, it was immediately clear why Stalin's "extraordinary investment" was not used "constructively." In 1941 the chief of staff of the Southwestern front, Lieutenant General M. A. Purkaev, astutely explained the reality created by the German surprise attack. He told Colonel A. I. Rodimtsev: "Yes, the situation now is such, comrade Rodimtsev, that it is easy to find one's way behind the enemy's lines without a paratroop drop. Some of our units and even large formations are already encircled."²²

In defensive war there is nowhere to jump. One must stop enemy tanks. All five air assault corps of the first wave were sent to stem the German tide. However, everything had already been prepared for the now-useless landing. Parachutes had been delivered to the air base loading areas. Commander of the 4th Air Assault Corps Zhadov recalled how he summoned Captain A. I. Goryachev, the aide to the chief of operations sector of the corps staff: "Do you know, comrade captain, what is gold?" He was dumbfounded by such an unanticipated question, but nevertheless answered: 'I have an idea, but I never had any gold.' 'Not true,' I said to him. 'A parachute was given to every Red Army soldier and commander. This is our nation's gold. Do you know where there are thousands of parachutes sitting out in the open? In the forest, one kilometer east of the river Berezina. Organize the transportation of this precious material to the rear.'²³

Captain Goryachev carried out the order. He found trucks, and under machine-gun fire from the advancing Germans, brought the parachutes to a safe place, for which he was rewarded with a medal. But these parachutes were never used again.

An airborne force is a fine precision tool in war. Using it as a defense force instead of regular infantry is to squander a precious asset. The paratroop units do not have the same heavy and powerful weapons as regular infantry, so their resistance in defense is much lower than that of regular infantry. Using paratroops to fight against tanks is the same as transporting bricks in a Ferrari race car—expensive and ineffective. But it was necessary to fight back, and the air assault corps were sent to the trenches to stop the tanks. Ten air assault corps, 100,000 men—150,000 if we count the separate brigades and reserve regiments. But where were the million paratroopers mentioned by *Pravda*?

In the spring of 1942 the Red Army suffered several crushing defeats at the same time: the 39th Army of Lieutenant General I. I. Maslennikov was surrounded and perished near Rzhev; the 33rd Army of Lieutenant General M. G. Efremov perished after being surrounded near Vyazma; the 2nd Shock Army of Lieutenant General A. A. Vlassov was cut off and encircled. Those who did not follow Vlassov's example and surrender, perished. The Crimean front was broken, during which the 44th, 47th, and 51st armies perished; and in the battle of Kharkov the 6th, 9th, 28th, and 57th armies were destroyed, along with seven separate tank and cavalry corps and a significant number of divisions, brigades, and regiments. Thousands of tanks and weapons and ample strategic resources were lost, and hundreds of thousands of

soldiers and officers were killed or taken prisoner. The Soviet strategic front in the south was broken along a vast stretch of territory, and the German troops, not meeting any opposition, made a gigantic thrust forward with two targets at once: the Caucasus and Stalingrad.

The loss of the Caucasus and its oil would have meant defeat for Stalin. The fall of Stalingrad would have meant the same thing: oil was transported through the Caspian Sea up the Volga. The easiest way to cut off the oil artery was to take Stalingrad. All that was needed was to get to the banks of the Volga, to set up a stronghold there, and to sink all incoming petroleum barges. Soviet troops were retreating in a disorganized manner. More simply put, they ran. Stalin issued the threatening order No. 227 that introduced anti-retreat detachments and penal battalions. The detachments were NKVD squads with machine guns, positioned behind the troops, and in the event of unauthorized retreat they fired on their own soldiers. Commanders who did not show enough tenacity in combat had their rank signs torn away and were sent to penal battalions as regular soldiers to expiate their guilt with their blood.

The demoralized Soviet troops could not be stopped by monstrous orders. Fresh reserves were needed. But regular reserves had already been used up during the winter offensive and in unsuccessful attempts to break through the Leningrad blockade and prevent defeat in Kharkov and in the Crimea. The focal point of the eastern front, the small town of Rzhev, was also the scene of heavy casualties.

Stalin could only be saved by a miracle, but a miracle happened. Two fresh and fully manned Guards corps, the 10th and the 11th, arrived and formed a defense wall before the German Fourth Tank Army that advanced in the direction of the Caucasus. Their appearance at the most critical moment precisely where they were badly needed saved the day. The offensive was halted and exhausted troops were able to catch their breath and regroup. Soviet commanders reinstated order and stability, and turned a rout into an organized retreat that soon stabilized the front lines for prolonged battles that led to a counteroffensive.

There were nine Guards rifle corps in the Red Army then, but they had long since been drawn into battle, exhausted and depleted.²⁴ It was impossible to take those remaining away from the fronts where they were fighting. So, where did the two new and fresh corps come from?

Another miracle occurred in the Stalingrad region. At that moment, the Red Army had the 31st Guards Rifle Division. It was impossible to pull it out of the “slaughterhouses” in which it was trapped and send it to Stalingrad. Yet suddenly near Stalingrad appeared the fresh, new 32nd Guards Rifle Division. Immediately, it was followed by similar divisions—the 33rd, 34th, 35th, and 36th. Both Hitler and Stalin were throwing fresh troops into the battle for Stalingrad. As the stakes rose, Stalin trumped with an ace: he introduced into the battle the 1st Guards Army, under Lieutenant General F. I. Golikov, which had five Guards rifle divisions: the 37th, 38th, 39th, 40th, and 41st. Before, there had been Guards regiments and brigades, divisions and corps. This was the entire 1st Guards Army, and not just any army, but a fresh one, fully staffed and with the best men, and a former GRU chief in command. Was Stalin a magician? No one knew where they were coming from, these Guards armies with serial numbers all in a row, just like brand-new money, crisp bills in a pack.

The war followed its course, and the Guards miracles continued. In the summer of 1943, a violent battle began on the Kursk bulge. The enemy carried out two extremely powerful attacks in converging directions. They were not successful in breaking through the Soviet defenses. There were many reasons, including the brilliant work done by Soviet intelligence,

which uncovered the enemy plan, and the Red Army's superiority in terms of quality and quantity of technology. But miracles also played a part. The German attack from the north was met by the 13th Army of the Central front. Among its components appeared the great 18th Guards Rifle Corps, staffed with the best men. And on the southern face of the Kursk bulge, the unbreakable Guards divisions suddenly appeared, as if from under the ground.

After deflecting the enemy's attacks, Soviet troops shifted to a decisive offensive. And once again, miracles occurred. A strategic reserve was introduced into battle on the Steppe front, in which was included the fully manned 4th Guards Army, staffed with the best soldiers and officers, and the top caliber 5th Guards Army fought bravely alongside them. But the war continued to devour lives. Whenever a crisis would arise a miracle occurred. Stalin always had some fresh select Guards division, corps, or even entire army in reserve.

The last Guards miracle occurred in March 1945 in Hungary, during the course of the Battle of Balaton when the Germans mounted their last powerful counterattack.

By the end of the war, Stalin was desperately short of troops. As Joseph Goebbels noted in his diary on March 3, 1945: "Their troops are extremely well armed, but they suffer more and more from lack of people. Their attacking infantry consists mostly of eastern workers and Poles, taken from our eastern regions."

In the beginning of 1945 the Red Army captured the last significant source of oil in Hungary, after which Germany was destined to crumble. Hitler urgently stopped his counteroffensive against American troops in the Ardennes and sent his main attack force, the Sixth Tank Army of the SS, to Hungary. There, in the Lake Balaton region, began his desperate last offensive to regain oil. A critical situation faced the Soviets. At that moment Stalin once again threw his trump ace on the table: he ordered fresh reserves, the 9th Guards Army, consisting of the 37th, 38th, and 39th Guards Rifle Corps, into battle. Each corps had three Guards rifle divisions. The Ninth Guards Army was fully manned by elite soldiers and officers. The Ninth Guards Army delivered a classic attack to the flank and rear of the SS Sixth Tank Army. Then the Ninth Guards Army continued its advance to Vienna, and through Prague to reach the Elbe River in Germany, where they joined forces with the Americans.

Where did Stalin get the reserves? Lieutenant General of the KGB V. A. Kirpichenko, who was a private in the war, recalled: "I served in the air assault troops-elite. We were trained and then practiced continually, but sent into action only in January 1945, not as airborne assault troops but as ordinary infantry. We broke the German blockade around Balaton, and earned Stalin's praise by stopping the last German offensive during the course of the war. To achieve this, we lost half of our troops."²⁵

Stalin never had the opportunity to use his paratroopers for his planned sudden attack against Germany to start the war. The Germans' surprise attack established a significant presence in the air, preventing the effective deployment of Soviet paratroops and glider assault troops. Stalin's airborne offensive was doomed. However, Stalin kept the paratroops in reserve. When crisis situations arose, he gave these elite units the honored title of Guards and sent them to fight German tanks as regular infantry soldiers.²⁶

That explains the "miracle."

About the Brilliant Military Leader Tukhachevski

After the unheard-of violence conducted by the Bolsheviks against the very people whom they betrayed and sentenced to starvation and death, there was no way back. The only thing left was to run fast to their own grave, under the party flag and Stalin's leadership.

—V. RAPOPORT, YU. ALEXEYEV, AND IZMENA RODINE,

BETRAYAL OF THE MOTHERLAND

In 1937, Stalin carried out an assault on the high command of the Red Army. There are countless legends about this period. This is what they sound like:

Marshal Tukhachevski was a great strategist. Tukhachevski proposed a modernization of the army and insisted on rearmament, but Stalin foolishly declined Tukha chevski's proposals, not understanding and not appreciating them. Hitler's intelligence service decided to behead the Red Army on the eve of the war, to eliminate Tukhachevski and other geniuses. The Germans fabricated a false document, and paranoid, suspicious Stalin believed it, unleashing a terror that took on catastrophic dimensions. Stalin destroyed the most talented men. The total number of exterminated army commanders was 36,761, and another 3,000 men in the navy. In total, this was 40,000 great troop commanders. The defeat of the Red Army in 1941 was a direct consequence of the terror in 1937 and 1938. In 1941, because of the mass extermination of the command staff, the vast majority of Soviet commanders did not have the necessary experience, because they had not been in their positions for more than a year.

All these legends fall apart as soon as they are examined. Let us begin with the first legend about the brilliant troop leader Tukhachevski.

Mikhail Tukhachevski had no higher education. He never went to a university or to a military academy. He graduated from a military school that trained junior officers. Tukhachevski never commanded a company, battalion, regiment, brigade, division, or corps. He was a deputy to a company commander in a Guards corps. His combat experience in World War I had been six months. In the beginning of 1915, he was taken prisoner. After his release, Tukhachevski returned to a reserve battalion of his old regiment. This was during

a time of total decay in the old country and army. Commanders for the most part were not appointed, but elected by soldiers. Understandably, the soldiers did not choose those who would demand discipline and order, but those who would not stop them from doing what soldiers like to do. The soldiers quickly ousted the commanders they did not like, and elected new ones. In order to keep one's position, one had to do nothing, and close one's eyes to all the soldiers' crimes and disorderly conduct. The soldiers liked Tukhachevski and elected him to be company commander. He did not "command" for long. An army with such a command system could not last for long. It rotted and fell apart.

The Communists then began to form their armed forces, which they called the Red Army. Junior officer Tukhachevski had a meeting with Lenin and Trotsky. What they talked about is not known, but Tukhachevski was immediately appointed commander of the 1st Army of the Eastern Front. Here, suddenly, surfaced Tukhachevski's ferocious nature. The Civil War in Russia was not only a war, but also a series of punitive expeditions against those who did not want Communism. Tukhachevski declared all those who opposed the illegal Communist leadership to be "bandits," and viciously exterminated not only them but also their relatives, their neighbors, and everyone who happened to come his way. The foundation of Tukhachevski's "strategy" was: the burning of villages, whippings, and mass shootings. Tukhachevski phrased the main objective not only of the Civil War, but of any other war as well, very clearly: "With an iron hand crush the local enemy classes." Many of Tukhachevski's combat orders are not about how to use a clever maneuver to bypass the enemy and hit him in the flank and rear, but about how many hostages are to be taken and when they are to be executed. Here is an example:

ORDER

To the Plenipotentiary Commission of All-Russia
Central Executive Committee, # 16
City of Tambov
June 23, 1921

The experience of the first combat area shows a high predisposition for quick cleansing from banditry through the following measures. Some localities with particularly strong bandit tendencies are noted, and representatives of the region's Political Commission, of a Special Section, Sections of the Military Tribunal and Command, together with units designed to conduct purges, are sent there. Upon their arrival, they surround the area, take hostage 60–100 of the most prominent persons, and introduce a siege. Entering and exiting the area must be forbidden during the course of the operation. After this, the entire population of the area is gathered, and the orders of the Commission of the All-Russia Central Executive Committee #130 and #171 and the signed sentence for this area are read aloud. The residents are given 2 hours to give up the bandits and their weapons, as well as the bandits' families, and the population is told that in the event of refusal the abovementioned hostages will be shot in 2 hours. If the population does not give up the bandits and weapons within the two-hour time limit, they are once again rounded up and the hostages are shot before their eyes, after which new hostages are taken and those gathered are once

again told to give up the bandits and their weapons. Those who wish to comply with the demands are separated, divided into groups of a hundred, and each hundred is put through a questioning commission (consisting of representatives of the Special Sector and the Military Tribunal). Each person must give a testimony, and not be allowed to claim ignorance. In the event of stubbornness, new executions are enacted, etc. From the material obtained through the questioning, expeditionary units are formed with the compulsory inclusion of the persons who gave the testimony, and they venture to capture the bandits. Upon the end of the purge, the siege is ended, and a revolutionary committee and militia are established to rule the area.

The current Plenipotentiary Commission of the All-Russia Central Executive Committee orders to execute this order fully.

Chairman of the Commission
Antonov-Ovseenko

Troops Commander
Tukhachevski

Tukhachevski and all other participants of that war against their own people declared themselves heroes of the Civil War.

Pay particular attention to the date of Tukhachevski's order: June 23, 1921. Twenty years later, Russia would be invaded by different occupants, but they would act in almost the same way. The difference was that Hitler herded the enemy's population into a ravine and machine-gunned them, while Tukhachevski, on top of this, besieged the entire population of his own country with a mutual criminal responsibility. Later on this method would be called, in the criminal underworld, "forced snitching." This is precisely what Antonov-Ovseenko, Tukhachevski, his deputy Uborevich, and all other strategists did: they forced all the people to become traitors and rats, forced them to betray their neighbors, relatives, fathers, and brothers, and then go after them in the forests and kill them. Tukhachevski introduced universal betrayal, using fear to crush and destroy the centuries-old Russian village morale. He replaced all moral codes with fear for one's own skin, and made each person accountable for all the others' deeds. Tukhachevski's idea was to crush the people's sense of their own worth. When we speak of the defeats of 1941, we blame Stalin. Let us not forget that the crushing of the people was done under the immediate command and on the initiative of the very same strategists who were later, during the purges, eliminated by Stalin.

In 1941, the masses who were taught by Tukhachevski to value only their own skin *a priori* could not have exhibited heroism.

Here is the reason for the army purges of 1937: Stalin was preparing for war against Germany. He decided to beat his country, the Army included, into submission. As a by-product of the purges, Stalin got rid of the bloodiest executioners: of Antonov-Ovseenko, Tukhachevski, Yakir, Uborevich, Blukher, and others like them. Such "troop leaders" could not be placed in positions to lead the masses mobilized for war. Soldiers would not follow these commanders into battle and, given the opportunity, would remember and remind these hatchet men of the crimes they committed during the previous two decades against their parents and older brothers.

On the other hand, all these strategists would have been incapable of leading the people into war. It is well known that an army that has sullied its uniforms with the blood of its own people is incapable of fighting against outside enemies. The primary reason for the decay of any army is its use against its own people. Everyone who has actively participated in this could no longer be a troop leader.

Here is another pearl from the treasury of strategist Tukhachevski's combat experience:

TO THE TROOPS' CHIEF OF STAFF

For signature by Kakurin

By the Political Commission of the 1st, 2nd, 3rd, 4th, 5th, and 6th districts

July 8, 1921

Defeated bandits are hiding in the forests and taking out their impotent rage on the local population, burning bridges [and] damaging dams and other government property. In the interest of securing the bridges, the Commission of the All-Russia Central Executive Committee orders:

Immediately take from the population of villages located near important bridges no less than five hostages, who in the event of damage done to the bridge are to be immediately executed.

Under supervision of the Revolutionary Committees, the local residents are to organize the defense of the bridges from bandit attacks; the local residents are also to take on the responsibility of repairing the damaged bridges no later than within a 24-hour deadline.

This order is to be widely distributed among all villages and towns.

Troop commander
Tukhachevski

The great strategist has strange logic: the bandits "are hiding in the forests and taking out their impotent rage on the local population," so Tukhachevski orders execution of hostages taken out of this very same local population.

All of Tukhachevski's experience can be narrowed down to two things: hostages and executions. Meanwhile, the taking of hostages was forbidden by the Hague Convention of 1907. Hostage taking has always been considered the most serious war crime. A troop leader who sullied his name with this sort of maneuver has always been despised. At Nuremberg and all subsequent trials of German Nazis the practice of taking hostages was regarded as a war crime and those guilty of it were sentenced to death by hanging.

So that would have been a proper place for Tukhachevski, Antonov-Ovseenko, and all other war criminals—on the defendants' bench at Nuremberg, in the company of Hermann Goering, Wilhelm Keitel, Alfred Jodl, and others.

Tukhachevski encountered real enemy troops only once. The Western front of the Red Army under Tukhachevski's command headed to the West with the intention of breaking through to Germany and unleashing a Communist revolution. But Tukhachevski did not reach Germany. His hordes were defeated near Warsaw by the Polish army commanded by Pilsudsky.

The defeat was shameful and total. Tukhachevski became enraged. We have been taught

that in 1920 Tukhachevski was defeated by the Polish cavalry, but if he had lived until 1941 and met the German tank armadas he undoubtedly would have defeated them. Lenin and Trotsky did not think so. They understood that Tukhachevski was only good for war against his own people. Therefore, he was once again sent to the inside front—to drown under ice the sailors who started the uprising at Kronstadt, to shoot hostages in Tambov county, and to burn villages. Here, Tukhachevski showed a true strategic talent.

Tukhachevski strove to get power in the stupidest way. He made a bigger fool of himself than anyone in the Civil War, and yet he declared himself a winner. He decided to personally edit the three-volume book *Civil War, 1918–1921*, portraying himself as a great strategist and blaming others for his defeats. Here it must be stressed that Tukhachevski strove specifically to edit history, not write it. Everyone who has read Tukhachevski's book, *March beyond Vistula* (*Pokhod za Vislu*), would agree that Tukhachevski was incapable of relating his thoughts. Marshal Joseph Pilsudsky crushed Tukhachevski, first on the battlefields and later in the pages of his book *The Year 1920*. Pilsudsky exposed both Tukhachevski's incapability to fight and his incapability to relate past events. Pilsudsky did not leave any part of Tukhachevski's book standing: "The extreme vagueness of the book gives us the image of a man who analyzes only his own brain or his heart, purposefully rejecting or simply not knowing how to tie his own thoughts with the everyday existence of troops, which not always corresponds to the plans and intentions of their commander, but often contradicts them. . . . Many events in the operations of 1920 occurred as they did precisely because [of] Tukhachevski's propensity to command the army with such an abstract method."

Legend number two: Tukhachevski proposed to Stalin a plan for modernizing the army. This legend is also easy to disperse. For this, one only needs to read Tukhachevski's "scientific works." Only someone who himself has not read Tukhachevski's creations can praise his work. Aside from using purposefully incomprehensible terms and long phrases, the meaning of which can be interpreted in any way one wants, Tukhachevski had one more weakness—he did not understand the significance of numbers. He always wanted to astound the reader and listener with unbelievable numbers.

"Multi-million [strong] armies deployed on the fronts stretching hundreds of thousands of kilometers."¹ This is how Tukhachevski describes World War I. Fronts stretching hundreds of thousands of kilometers? Is this not nonsense? France, Britain, their vassals from the colonies, and later the United States fought against Germany. The Western front stretched from the shores of the North Sea to the Swiss border. In a straight line, this does not even make five hundred kilometers. A front is obviously not drawn in a straight line. But even with all possible bends and turns, one cannot scrounge up enough for a thousand kilometers. And all the millions of French, British, Australian, New Zealander, Canadian, and then American troops in World War I were positioned along these kilometers. If the front had stretched hundreds of thousands of kilometers, how many millions of soldiers would be needed to cover it?

The Eastern front in World War I stretched from the Baltic Sea to the Black Sea. This is less than two thousand kilometers. The front was not a straight line, so let us assume three thousand kilometers. Where did fronts stretching hundreds of thousands of kilometers come from? If the northern hemisphere had fought against the southern, and the trenches were dug along the bottom of the seas and oceans, even then we would still only get forty thousand kilometers. Did Tukhachevski know the length of the equator? Where, on this small planet, could one find fronts hundreds of thousands of kilometers in length?

Yet for decades this was published not only in the *Selected Works* of Tukhachevski, but in compilations that demonstrate the best accomplishments of strategic thought.

In 1927, Chief of Staff of the Red Army Tukhachevski wrote a letter to Stalin and proposed a military reform. Marshal of the Soviet Union S. S. Biruzov in his praising essay, as if by the way, notes that: “The addressing of these questions by M. N. Tukhachevski was correct and timely, but as to concrete data, they needed to be made more specific.”²

Instead of fulfilling his direct duties Tukhachevski, the genius strategist, plunged into the development of some pipe-dream project. And everything he did was correct, timely, and extremely necessary. Only his numbers needed to be more exact. Does one need to pay attention to such minor details?

I think, yes. The General Staff is the brain of the army. A country cannot have a man more cautious than the Chief of General Staff. His accuracy first and foremost needs to be applied to his work with numbers. Thousands of the most highly qualified officers are under the command of the Chief of General Staff. The General Staff exists to think everything through, count and calculate everything, and then, having weighed all the information and taken into account the thousands of contradictory circumstances, report to the head of the country.

What numbers are we talking about? What exactly did Tukhachevski propose to Stalin? For decades, scholars have praised Tukhachevski the innovator, who proposed something very interesting, but for some reason nobody says what exactly it was that he proposed. We shall think about this: could a person who did not understand the significance of numbers have proposed anything of value?

Lieutenant General of the Air Force V. V. Serebrianikov described what sort of reform Tukhachevski proposed to Stalin. It turns out that in December 1927 Tukhachevski, on top of everything else, suggested to Stalin to produce during the course of 1928 alone 50,000 to 100,000 tanks.³

Let us compare and evaluate this number.

In 1928, Hitler was not in power in Germany. Nobody could even imagine that he would ever come to power. Germany at that time did not have one single tank. The entire German army consisted of 100,000 soldiers, officers, and generals—all of them infantry and cavalry. Tukhachevski proposed to have one Soviet tank for every German general, officer, and infantry soldier in the ranks, as well as for every German messenger and cook in the field kitchen.

On September 1, 1939, Hitler entered World War II with 2,980 tanks, among which there were no amphibious tanks and no medium or heavy tanks. We are told that it is clear: if Hitler had such a huge number of tanks, it must have meant they were not for defense, they were not for Europe alone. If Hitler had built such a number of tanks, it obviously meant that he planned to conquer the world.

I fully agree with this. But in that case, what did Tukhachevski plan to do with armadas of 50,000 to 100,000 tanks?

The 2,980 German tanks were built not during one year, but during all the prewar years. Tukhachevski, on the other hand, proposed to build 50,000 to 100,000 tanks in just one year.

It is interesting to compare Tukhachevski's plans for 1928 with real production of tanks (not including self-propelled guns—see below) in Germany during the course of World War II:

<u>YEAR</u>	<u>TANKS</u>
1939	743
1940	1,515
1941	3,113
1942	4,276
1943	5,663
1944	7,975
1945	956

In total, during the prewar months of 1939 and all the subsequent years of the war, Germany produced 24,241 tanks. Japan built 5,085 tanks, most of them light.

We have been taught a formulaic phrase: “the German fascists and Japanese militarists.” Indeed, if they produced such a large number of tanks, 24,241 and 5,085 respectively, it is clear to everybody that this is fascism and militarism. But the question arises: Who was Tukhachevski, in the context of these fascists and militarists striving for world domination?

After the war the Soviet Union, already a much more powerful industrial giant, had 50,000 tanks, or even slightly more. But these tanks were not produced in one year; they had accumulated for decades.

But even this careful gradual accumulation of tanks did not save the Soviet Union. The great industrial giant crumbled. Its legs folded under its weight. Those very same thousands of tanks played far from a minor role in the crumbling of the Soviet Union.

Meanwhile, the brilliant Tukhachevski proposed that Stalin not gradually, for decades, amass such a might, but that he produce all at once, in one year, 50,000 to 100,000 tanks. The result of such an action is easy to predict: the legs of the Soviet Union would have folded immediately.

The USSR had no tank factories at that time. Even if they had existed, it would still first of all have been necessary to stop production of all heavy machinery—automobiles, ships, locomotives, railroad cars, tractors, and all others—and to remodel these factories to produce tanks.

If one had accepted Tukhachevski’s proposal, it would have been necessary to stop all the industry of a gigantic country for a minimum of one year and fully remodel it for producing tanks.

By the standards of any army, two hundred to three hundred tanks are a tank division. In the 1970s, during the peak of the Cold War, the American army, the army of the most powerful nation in the world, had sixteen divisions, among them four tank divisions.

Hitler went after world domination in September 1939 with just six tank divisions. In 1927 neither Germany, nor the United States, nor France, nor Japan had any tank divisions. If Stalin had listened to Tukhachevski and produced 50,000 to 100,000 tanks, the Soviet Union within one year would have had 166 to 500 tank divisions.

At that time the crew of one tank consisted of three men. Crews for 50,000 to 100,000 tanks would have meant that the tank troops would need to number 150,000 to 300,000 soldiers, correct? No, incorrect.

Tank crews make up an insignificant minority of men in a tank division. First of all, tanks must constantly and at the right time be supplied with liquid fuel and lubricants. Tanks also need shells and cartridges. This adds another column of automobiles with ammunition.

Furthermore, tanks need repair, and not only in stationary repair shops but in the field. For this one needs to have mobile tank-repair shops and even mobile tank-repair factories. This again means more men and automobiles.

But in order to repair a tank it must be towed under enemy fire out of the ditch, swamp, or battlefield and taken to the mobile repair shop. For this one needs specialized repair-evacuation units.

In order to repair a tank in field conditions, the necessary spare parts must constantly be supplied to the battle area. So, our column of tanks is followed by a long tail without which the tank units cannot act.

Tanks need to be defended and protected in close battle; the success of tanks needs to be retained. This is done by the motorized infantry. Every tank division needs its own regiment of motorized infantry, and every corps needs its own motorized infantry division. Tank action needs to be supported by artillery fire. For this we have guns and mortars. The action of tanks, infantry, and artillery needs to be protected. For this we have anti-tank cannons. All this needs to be organized and coordinated. Troop command needs to have a flow of information through thousands of different channels. This is provided by communication units. All this means more automobiles and more men.

The Soviet standard for the year 1940 was as follows: for the bare necessities of supplying the operation of 1,000 tanks (one mechanized corps—1,031 tanks), 36,080 soldiers and officers, 358 guns and mortars, 266 armored cars, 352 tractors, and 5,165 automobiles were needed. This is not counting reinforcements, air force, and the rear formation that had to supply this entire mass of troops.

We thought that one tank just needed three men, but in reality it needed thirty-six men. The war later showed that the prewar calculations were too low. In order to maintain the action of each tank on the battlefield one needed seventy to eighty men per tank, twice as many automobiles as supposed before the war, and thrice as much artillery.

But even using the lowered prewar calculations, to fulfill Tukhachevski's program the tank troops would have needed to have 1.8 million to 3.6 million soldiers and officers, 18,000 to 36,000 tractors, as many guns and mortars, 13,000 to 26,000 armored cars, and 250,000 to 500,000 trucks.

The German armed forces at that time counted 100,000 soldiers, officers, and generals. Meanwhile, Tukhachevski envisioned the Red Army having half a million men just to drive the automobiles in the tank divisions. Not counting the drivers of tanks, artillery pulls, and armored cars, plus commanders, communications officers, sappers, intelligence, and all the rest.

Perhaps Tukhachevski thought the tank troops could do without automobiles?

The Soviet Union at that time could not have devoted half a million automobiles to the tank troops. It could not have given a quarter million either. It could not have devoted so many automobiles not just to the tank troops, but to the entire armed force. And if it had, then agriculture, the transportation system, construction, and industry would have been left without automobiles and tractors. If all automobiles were given to the tank troops, then how much fuel, oil, and spare parts would those cars have used up?

And how would such tank troops have been manned? There was no mandatory universal draft in the Soviet Union at that time. Should one have been instituted? This was already beyond the duties of the Chief of Staff of the Red Army.

Let us assume that Tukhachevski decided to keep 1.8 to 3.6 million soldiers in the tank troops alone. Where would they have been trained? Practically everyone who finds himself in tank forces needs special preparations. These soldiers would have needed to learn how to be radio operators, repairmen, gunners, scouts, and commanders. Would everyone have had to go through training divisions? How many training divisions would have been needed?

And what would have been done about officers? Tukhachevski's proposal was to produce the tanks immediately. Even if they had been produced, how many officers would have been needed to staff at least one hundred new tank divisions? The USSR could have opened new military academies. During peacetime, an officer was trained for three years. Tanks would have been arriving from the plants, as Tukhachevski planned, in 1928, but the officers would not have graduated until 1931, and they all would have been young and inexperienced, while what was needed at the time was commanders for battalions, regiments, divisions, and corps.

Where would the officers have lived? Even now Russia is incapable of building housing for all her officers. Back then, where would the officers have lived—in tents? Where would they have found enough tents?

Where were the tanks to be stored? During wartime it is easy: tanks loaded on railway trains travel from the factories directly to the front and go into action, and the life of a tank in the war is short: very soon it has to go into repair or is melted down, and new tanks take its place. Tanks do not need to be stored. They do not accumulate: while tanks are unloaded from one train, the tanks from the previous one are already burning in battle.

But here is the situation: in peacetime, a stream of steel monsters suddenly flows in from the production plants. What are we to do with them? Keep them in the open fields, in the cold and the snow?

In addition, the armed forces of that time could not consist of just tank corps and tank armies. For every tank and motorized division there needed to be a minimum of three to four rifle divisions. Consequently, there would have to be from 847 to 3,000 rifle divisions. At that time, Germany had twelve divisions, in total.

Some think that the army's strength is in its numbers. Tukhachevski was from that breed of strategists who wanted to fight with numbers. But, as we can see, even with numbers he had some difficulties. He never understood the meaning of numbers. He never learned to work with them.

Tukhachevski was incapable of working out the simplest calculation of the consequences of his actions and proposals. We have to marvel at Stalin's patience—how could such a strategist have been kept in high government positions?

If 50,000 to 100,000 tanks are produced in one year, one should simultaneously produce about as many airplanes, because without air force support the tanks become coffins. Fifty to one hundred thousand airplanes? In one year? Where would they have been built? At what factories? Or, perhaps we would not have produced the planes right away, just put out all the tanks and left them without air support? This would have been a crime; it would have been treason. For such actions one should be executed.

So, what kind of army did Tukhachevski want to form? Or did he plan to just have tanks without airplanes or artillery?

Tukhachevski demanded: we need to produce tanks! Here, many questions arise, and quite an important one among them is: What kinds of tanks?

For mass production, one needs not just an industrial base, but also a model of the machine that is to be produced. In 1928, there was no industrial base, and there was also no fitting tank model for production. In 1927, the Red Army enlisted into its armament the MS-1 tank. The power of its engine speaks for everything else: 35 horsepower. The armor of the MS-1 tank was held together with rivets. Its maximum speed was 16 km/h. On Red Square, for the parade, it went up to 19 km/h. This was our best tank. A small (by our standards) series of these tanks was needed for designers to get their first experience in the creation of a tank, and for troops to get the opportunity to use real tanks in training, although they were extremely weak and flawed. This tank was also useful to the troops for small border disputes. When there is nothing better . . . But to make them by the tens of thousands? Who needs them? Perhaps we could have bought a foreign model? There was nothing to buy. In 1928, nobody in the entire world could have offered a model worthy of being mass-produced in a large series.

Arms production demands colossal expenditures. Therefore, intelligent people design weapons, produce them in small series, and have production and mobilization reserves of everything necessary to supply the mass production of the latest models in a period of threat.

In places where not very intelligent leaders rule, the peacetime army is enormous. The country strains itself trying to clothe, feed, and arm such an army. This army demands a huge amount of weapons during peacetime—but weapons age. The time comes when they have to be replaced, and this is a true disaster for the country. Technology development is rapid, and the gigantic arsenals have to constantly be renewed, which turns into a perpetual catastrophe. The result is that we defeat ourselves.

Why did Tukhachevski need so many weapons in 1927? Hundreds of times more than all potential aggressors put together. Who threatened us then? Who could attack us in 1928? Romania? Finland? Estonia in alliance with Latvia, and egged on by Lithuania? Disarmed Germany? Perhaps Japan? But Japan is an island nation, and to fight her, in order to avert the landing and supplying of Japanese troops on the continent, we would have needed to build a strong fleet in the Far East. But Tukhachevski was opposed to the idea of building a strong fleet and spoke against it publicly.

And so, what were the 100,000 tanks for?

Tukhachevski's defenders say that everything in his proposals is correct, only the numbers had to be clarified. But if numbers are clarified nothing remains of Tukhachevski's proposals at all. Aside from insane numbers, they contained nothing.

Meanwhile, Tukhachevski advanced more and more new projects.

"The USSR's industry had to reach by the year 1938 a production capacity that would be capable during the course of one year to put out 53,000 guns, 90,000 tanks, and 60,000 airplanes. The views about the production possibilities were formed under the influence of M. Tukhachevski."⁴ This is quoted in a Soviet military textbook!

Inevitably, the question to be asked here is: what is the difference between Stalin and Tukhachevski? Stalin also planned to produce 100,000 to 150,000 airplanes, of the model Ivanov!

There is a difference, and it is tremendous. Tukhachevski planned an incredibly huge military production during peacetime. This would have bankrupted the country. There was nothing to do with and nowhere to store the produced arsenal. If war had not happened in the near future, the mountains of arms would have quickly aged and rusted.

Stalin, on the other hand, proposed an entirely different plan: to create during peacetime an airplane for mass production, but to produce it in a small series. The beginning of the mass production was to happen only after the beginning of a victorious war.

A legend is told around the world that German intelligence supplied Stalin with a false document proving that Tukhachevski was forming a plot. Stalin believed the false document and destroyed the great strategist Tukhachevski.

If this is the truth, the Red Army should be thankful to German intelligence for an invaluable service.

15

The Cleansing

Only one who first conquers his own people can overcome a powerful enemy.

—SHANG YANG, FIFTH CENTURY BC

Power struggles never died down in the Communist Party. Party purges followed one after the other. Stalin drove all his opponents out of the party, and then they were arrested, tried, sent to prisons and labor camps, and executed according to court sentences without an appeal. Stalin put those he personally chose and cultivated into the opened positions. An equally continuous process of replacing the personnel in the secret police, and in the fields of science, art, literature, industry, trade, and agriculture went on at the same time as the permanent purges of the party. Arrests and trials of engineers, historians, and members of defunct political parties and organizations were constant. Any dictator acts in this way, and without any hints from outside sources. In order to lead the country to conquering other nations, any dictator begins with terror against his own surroundings. In order to raise many men and lead them to conquer the world, in order to reach “the last sea,” Genghis Khan before all had to conquer the most powerful and rich princes. Those who did not want to follow him had their spines broken on his orders.

This is exactly what Stalin did. In order to raise the nation to accomplish great deeds, he first of all had to obtain unquestioning obedience.

But in all the purges, for many years the army was the exception. The purges left the army alone. Stalin for a long time made sure to see that at the very top he had his own man. The army was only purged by Tukhachevski himself, who chased out all those he did not like personally. But Stalin had to reach the army sometime! Didn't he? Could he have possibly, without receiving the German false document, left the army untouched?

The purges were a struggle for fortification of power, for its preservation. This is a struggle for the leader's personal safety. The purges were a means to avert an uprising. Uprisings are always and everywhere started first and foremost by the military.

In his books, Tukhachevski shamelessly praised and lauded himself. For example, he transformed his disgraceful defeat near Warsaw into a brilliant victory. Everyone who has

read Tukhachevski's books clearly saw that they were written by a very strange man completely infatuated with himself, a man with impossible ambitions. Such a man is extremely dangerous in a position at the top of the military command.

Stalin for many years conducted preparations for eliminating high-ranking military leaders whom he deemed untrustworthy. Tukhachevski was one of them: the most famous, but certainly not the only one. Following are the most prominent examples.

On the night of July 2, 1935, Corps Commander G. Gay was arrested. The 3rd Cavalry Corps under his command had been the main assault and maneuvering force in the battle near Warsaw fought by Tukhachevski in 1920. In 1935 Gay was the head of the military history department at the Zhukovsky Air Force Academy. In those times the Soviet Union did not have military history other than the Civil War. All that had preceded the Civil War was treated as a foreword and reviewed very superficially and briefly. The history of the Civil War, on the other hand, was learned meticulously. The reason Gay was arrested was that he was not teaching military history "correctly," and the required reading for his students was the history of the Civil War prepared by Tukhachevski.

On April 17, 1936, N. I. Muralov, who had become commander of the Moscow military district back in 1917, was arrested. It was under Muralov's cover that the Lenin-Trotsky government fled from Petrograd to Moscow in 1918. In 1936 Stalin began to put pressure on all those who had been chosen by Lenin and Trotsky and placed in high positions.

On June 9, 1936, division commander D. Shmidt, a friend of Tukhachevski, was arrested. On August 14, 1936, Corps Commander Primakov was arrested. Primakov was connected with Tukhachevski for many years: he had been under Tukhachevski's command back in 1920, in the campaign to occupy Poland. Later Primakov was tried and executed at the same time as Tukhachevski.

On August 15, 1936, Brigade Commander M. O. Zyuk, commander of the 25th Chapaev Division, was arrested.

On August 20, 1936, another future codefendant was arrested—Corps Commander Putna. Two of the eight defendants from Tukhachevski's group were already in prison. The process had begun.

Corps Commander S. A. Turovsky was arrested on September 2, 1936. Division Commander Y. V. Sablin was arrested on September 25. The Byelorussian military district commander, I. P. Uborevich, a friend and follower of Tukhachevski, was arrested on May 29, 1937. Later they were executed together. So, in January 1937 the composition of the group of high commanders who were to fall under suspicion was already becoming clear: as a group, they vocally opposed K. E. Voroshilov, Stalin's perennial favorite, who then was Minister of Defense.

On January 24, 1937, at an open court trial, former member of the Central Committee of the Communist Party Karl Radek, who had been accused of espionage, treason, and preparation of a coup, named Tukhachevski as a collaborator. Anyone who knows anything about Stalin's open trials, and who has thought about the meaning and significance of these trials, will agree that names were never mentioned there by accident. According to Radek, Tukhachevski had sent Corps Commander Putna to Berlin, where he conducted talks with Trotskyites. Tukhachevski personally was not yet being accused of anything; he only sent Putna to Berlin on business, and Putna used the opportunity.

From this moment, Tukhachevski could have blown his brains out—his fate had not only been decided, but publicly declared. Walther Schellenberg, a Nazi foreign intelligence agent, relates that in May 1937 German Intelligence had succeeded in passing to Stalin a forged document which presented Tukhachevski as a head of the Red Army generals' plot to overthrow the Soviet government.¹ As the story goes, Stalin was duped by this forgery and started the purges in the Red Army. The Germans thus had crippled the Red Army with Stalin's hands.

But a simple check of chronology shows that Schellenberg's story is not correct: the above-mentioned purges started in the summer of 1935, long before the forged document was allegedly created by German Intelligence.

There are many tales about 1937. They are surprisingly absurd and just as surprisingly resilient. But it suffices to ask just one question for the picture that has been painted for decades to immediately fall apart.

Here is one more myth: in 1937–38, Stalin executed forty thousand commanders, therefore in 1941 most commanders had not been at their post for more than one year.

But this could not be!

Let us imagine that in 1937 Stalin executed all commanders—every single one, from platoon commanders to marshals. He herded them all into abandoned cellars and machine-gunned them down, and then appointed new commanders to their posts. Let's imagine this complete change of the command staff. Here is what would have happened: by the summer of 1941, all the newly appointed commanders would have had four years of experience. How could it be that the purge occurred in 1937, but by 1941 the majority of commanders had less than a year's experience in their positions? There are objections that the executions happened not only in 1937, but in 1938 as well. Good, we can allow that the commanders appointed in 1937 were in the following year machine-gunned in the cellars. Another, third group of command personnel was appointed. In this case, the third group appointed in 1938 should have had three years of experience by 1941. If a full change of command occurred, the majority of these commanders could not have gone anywhere. Understandably during three years someone drowned, someone became a drunk. One, two, three hundred were executed in 1939, 1940, and the first half of 1941. There could have been some shuffling and reshuffling. But the majority should have stayed in their places. How did it happen that the purges occurred in 1937–38, but in three to four years the new commanders did not have even a full year of experience at their posts?

The answer to the mysterious lack of experience on the job is simple: in the years 1937–41 the Red Army grew five-fold, from 1.1 million to 5.5 million. The commanding positions had to be filled, so the officers were promoted quickly and did not have time to "grow" into their jobs. Similarly quick promotions occurred then in the German army as well, but nobody claims that German commanders were incompetent.

This problem can be examined from another perspective. Stalin's army was large. Forty thousand commanders are not that many. The officer corps of the Red Army in February 1937 is known to have numbered 206,000. The source of this number is the top-secret speech given at the February–March plenary session of the Central Committee by Politburo member and People's Commissar of Defense of the USSR, Marshal of the Soviet Union K. E. Voroshilov.²

Let's allow that 40,000 out of 206,000 were executed. This is less than 20 percent. The question is the same, only seen from a different perspective: how did it happen that less than 20 percent were executed, but in 1941 the majority of commanders did not have a year of experience at their occupied post?

We see that the legends about the year 1937 are quite vulnerable. It is enough to ask the simplest questions—and not one Communist historian will be able to give a reasonable answer.

July 29, 1938, was the peak of the terror. After this, the intensity dropped drastically. On September 19, 1938, the chief of the 6th (Manpower) Department of the command staff of the Red Army, Colonel Shiryaev, presented to the Deputy People's Commissar of Defense E. A. Shchyadenko a document that specified the number of commanders dismissed from the ranks of the Red Army during the period starting in 1937 through September 1938. The document is kept in the Russian State Military Archive, fund 37837, index 10, case 142, sheet 93. Here it is—a primary source. The numbers are as follows: in 1937, 20,643 men were dismissed; in 1938, 16,118, for a total of 36,761.

Let's turn our attention to one small detail: in the document, the numbers refer not to "executed" but to "dismissed" men.

For fifty-four years, this document was secret, and only a very limited number of extremely dishonest men had access to it. These men committed a crime against history. They reported the number—36,761. From this everyone made a seemingly logical deduction: if the person was fired, he was arrested, and if he was arrested, he was executed.

But this was not the case. Dismissed did not always mean arrested. And arrested did not always mean executed.

The document gives additional information: out of the number of people dismissed in 1937, 5,811 were arrested, and 5,057 in 1938. In total, 10,868 people were arrested.

We were told of 40,000 *executed*, but in reality there were 10,868 *arrested*, and of them 1,654 were executed or died in prison before their trials started.³

There is a difference between arrest and execution. Some of those arrested were executed, but not all of them. I will use an example to explain the difference. In 1937, Commander of the 5th Cavalry Corps Konstantin Konstantinovich Rokossovskii was dismissed from the ranks of the Red Army. He was not just dismissed, but also arrested. But this is not yet an execution. He was imprisoned, and then let out. He fought through the entire war. He finished the war with the rank of Marshal of the Soviet Union and commanded the victory parade at the Red Square. He was not alone among the 10,868 arrested commanders; many of them were set free.

This is an example of Kremlin propaganda. If the document had been published fully at the time, stating that so many people were dismissed, so many out of them arrested, but not all of them executed, this mess would never have arisen. But the people who had access to the documents purposefully published only fragments of information. The explanations were omitted, which created the necessary conditions for rumors and legends.

Later on, when thousands of historians and agitators wrote into their works the information about forty thousand executed troop commanders, when hundreds of millions of people remembered this number, the document was fully published, but by then it could not change anything. Who would pay attention to a small article in a journal for specialists?

But what happened to the rest, who were dismissed but not arrested? Where did they go?

There is no secret here. In every army there is a continuous process of change, replacing the old with the new, rejuvenating the command staff. Every year military academies turn out thousands of new officers. The army never has too many officers. Every year it takes into its ranks new ones, and sends the same number of old ones back into civilian life. The main reason for dismissal is the completion of service. I will not intrude here with my own calculations, but imagine that your army has two hundred thousand officers. Estimate how many years an officer serves, decide how many commanders you must let go every year to their well-earned retirement, and then replace them with the new graduates from the academies, so that you have a constant process of renewing the ranks and so that you do not have stagnation.

The document presented to the Deputy People's Commissar of Defense is titled accordingly: "Document about the number of dismissals from the command staff in 1937–1938." Who would dare suppose that during these years nobody was dismissed from the army upon completing years of service?

It must also be remembered that not every officer reached his retirement age. A second reason for dismissal was state of health. Those who went through two, or even three wars, had all sorts of experiences. One had frostbitten legs, another had damaged hearing, and another one had old wounds that would not heal. People can be dismissed from the army not only for war wounds, but also for a number of other illnesses, from flat feet to cancer.

Aside from all this, there is such a punishment as dismissal from the army. It is no longer the year 1937, but officers are still being dismissed from the army for all kinds of reasons. The main ones are drunkenness, moral degradation, breach of discipline, and disobedience to authority. Who could dare assert that in 1937 nobody was dismissed from the army for drunkenness? This does not at all entail that the drunk was arrested and executed.

Even of those who were arrested, not all were victims of political repressions. There have always been military crimes and property crimes and so on. Among officers there have always been rapists, murderers, thieves, and other criminals. The document speaks of all those arrested without distinguishing between the political and the criminals. Who could dare assert that in 1937 there were no criminals among the command staff of the Red Army?

On May 5, 1940, E. A. Shchyadenko signed the "Report of the chief of the command of the staff personnel of the Red Army of the Defense Commissariat of the USSR." The concluding phrase: "Those unjustly dismissed are returned to the army: in total by May 1, 1940—12,461." It is important to note that the number of those returned to the ranks is higher than the number of those arrested. And this is easy to explain: both those who were arrested and those who were simply dismissed were returned to the ranks. The Kremlin propaganda endlessly repeats the story about the 40,000 executed commanders, but for some reason nobody likes to remember that 12,461 of those "executed" returned to the ranks. And this is only the beginning of the process. It is known that the main mass of those dismissed returned in the second half of 1940, and especially in the first half of 1941—for example, A. V. Gorbатов, a future General of the Red Army. Many such examples can be brought up. A strange story surfaces: Shchyadenko, who wrote the document about the dismissed commanders, is often quoted. But the same Shchyadenko who reports of the return of those who were dismissed is never remembered or quoted.

We have been taught to think that Stalin executed all the intelligent people and left only idiots in command of the army. But here is the opinion of German Major General F. W. von Mellentin, who fought against the Red Army: "The Russian high command knows its job better than the command of any other army."⁴ So it seems that Stalin did not execute all the geniuses before the war; some of them were left.

The enemy's opinion cannot always be trusted, so let us see what the Russian historians say about the effect that the purges of 1937–38 had on the Red Army. G. Gerasimov had studied the hard data and compared the characteristics of the commanders on the eve of German invasion in 1941 and in 1936, before the purges started:

In 1941, 7.1 percent of all commanders had higher education, while in 1936 that figure was only 6.6 percent;

In 1941, 52 percent of the generals had higher education, in 1936 only 29 percent;

In 1941, 29.5 percent of all commanders had combat experience, while in 1934–38 that figure was 23 percent.⁵

Gerasimov had also found that many of the purged commanders were heroes of the Civil War. Treated as such, they were quickly promoted to the political leadership and, though retaining their high ranks, they in fact left active military service. On the other hand, their less illustrious comrades had to plod through the ranks and thus acquired the experience that the political leaders clearly lacked.

With all that said, Gerasimov hints that the purges might have brought fear and uncertainty among the commanders of the Red Army. But he admits that this criterion can hardly be measured, and his final conclusion is that the purges did not weaken the Red Army.

A surprising fact: Stalin's marshals—Rokossovskii, Malinovsky, Govorov, Meretskov, and Vassilevsky—during the course of the war performed true miracles. Goebbels wrote the following about them in his diary on March 15, 1945: "Stalin has all the reasons to honor the Soviet marshals like movie stars, they showed remarkable military talents."⁶ But in the summer of 1941 all these men, to put it subtly, did not show remarkable talents. So what happened? They were idiots in the beginning of the war, and then got smarter by the end? That does not happen. A man acquires experience in the war, but an idiot always stays an idiot. The idiots of 1941 could not have turned into outstanding troop leaders.

Only one conclusion follows from all this: Stalin's commanders were not idiots in 1941. The reasons for the defeat of the Red Army in 1941 should be searched for, but not in the stupidity of Stalin's generals.

16

Spain

All the peoples who fall under the “protection” of victorious Germany will also become our allies. We will have a broad field of action for development of the world revolution.

—JOSEPH STALIN, SPEECH AT A MEETING OF THE POLITBURO OF
THE PARTY CENTRAL COMMITTEE, AUGUST 19, 1939

On July 18, 1936, the radio station of the city of Ceuta (then in Spanish Morocco) transmitted several times the code phrase: “The skies above all of Spain are clear.” This was the signal to begin the militant uprising against the Spanish Republic. General José Sanjurjo was at the head of the uprising, and after his death the position was taken over by General Francisco Franco. At the beginning, the troops located in the colonies provided support to the uprising. The militants had to transport these troops quickly from North Africa to Spain. Hitler came to General Franco’s aid. He allocated twenty Ju-52 military-transport airplanes, which for almost three months made continuous trips from Morocco to Spain and back.¹ “Between July 28, 1936, and the end of August of the same year, the three-engine Junker Ju-52 aircraft transferred a total of 7,350 soldiers and officers, as well as some artillery units and machine guns, from Africa to Spain. The planes made 461 flights, often with over-limit cargo. An additional 5,455 troops were transferred during 324 such flights in September; then 1,157 more troops during 83 flights in October. Later on, Hitler noted that “Franco needs to erect a monument, honoring the Ju-52 as the aircraft, responsible for his victory in Spain.”² This was the first mass transport of troops by air in history. This air bridge saved the uprising in its most critical early stage. After this, military units of the Spanish army began coming to Franco’s side. “Eighty percent of the armed forces—120,000 soldiers and officers and a significant part of the civilian guard—found themselves on the side of the uprising.”³ General Franco was aided by the dictators of Germany, Italy, and Portugal—Hitler, Mussolini, and Salazar. Fifty thousand German, 150,000 Italian, 20,000 Portuguese, and 90,000 Moroccan soldiers and officers fought on General Franco’s side. Foreign aid to General Franco amounted to 2,700 guns, 1,150 tanks and armored cars, and 1,650 airplanes.⁴

The People's Army was formed out of the parts of the Spanish army that remained loyal to the Republic. Volunteers from around the world came to the defense of the Spanish republic and formed seven international brigades. According to the figures of one of the brigade leaders, K. Sverchevsky, the total number of international volunteer troops was no less than 42,000.⁵ Volunteers from fifty-four nations of the world were enlisted in the Republican army.⁶

The Soviet Union could not remain on the sidelines. V. A. Antonov-Ovseenko arrived in Spain. In 1917 he had been one of the key figures during the Communist takeover in Russia. He had been among the leaders who stormed the Winter Palace, and had personally arrested the provisional government. Having taken down the legal government, Antonov-Ovseenko entered the illegal government that was not recognized by Russia's allies, but was recognized by her enemies with whom Russia was in a state of war. In 1936 Stalin appointed Antonov-Ovseenko general consul of the Soviet Union in Barcelona. He began with recommending to the Spanish Republic's government to hide the gold reserves of the country. Where should they hide it? In Moscow. The Spanish gold reserves were brought out of the country, and never again returned. They say that the anarchists were thieves. That was true. But the gigantic reserves of Spanish gold were taken away not by anarchists, but by the unselfish Communists. The Spanish gold reserves were payment for the supply of weapons. The supply was indeed a large one, but it should openly be declared that the Soviet Union did not support the government of the Spanish Republic out of honorable feelings, but for gold, which Antonov-Ovseenko brought out of the country.⁷

Stalin appointed Jan Karlovich Berzin, commander of the 4th Directorate of the General Staff of the Red Army, to the position of chief military advisor to the Spanish Republican army. Overall, 2,065 commanders of various ranks were sent from the Red Army to Spain: 772 pilots, 351 tankers, 100 artilleryists, 222 general military advisors, and 204 interpreters.⁸ Additionally, through the NKVD line, the People's Commissariat of Foreign Affairs, and other administrations, several hundred more Soviet diplomats, intelligence and counterintelligence officers, saboteurs, journalists, agitators, party workers, and military industry specialists were sent to Spain. The total number of volunteers, including civilian specialists, was around three thousand.⁹

Stalin sent to Spain 648 warplanes, 347 tanks, 60 armored cars, 1,186 artillery weapons, 20,486 machine guns, and 497,813 rifles.¹⁰ Aside from this, Spain received from the Soviet Union shells, cartridges, bombs, military equipment, food supplies, fuel, lubricants, and medications.¹¹ These deliveries of arms could have been much larger, but Spain was blockaded. Soviet merchant ships sailed out of Black Sea ports. In the Mediterranean Sea, the Soviet Union had neither a military fleet nor military naval bases. Defenseless merchant ships crossed the entire Mediterranean Sea to reach Spanish shores. From the Black Sea straits to the destination ports, these ships were followed by Italian and German airplanes and warships. And at the end of their destination, near the Spanish coast, they were awaited by General Franco's warships, airplanes, and submarines. Nonetheless, despite the blockade, Stalin managed to transfer to Spain a huge, by any standards, amount of strategic cargo.

In order to understand the seriousness of Stalin's intent, let us assess several of the commanders he sent to Spain. They were then lieutenants, captains, and colonels. However, they were the most promising commanders of the Red Army, and Stalin had noted them for

promotion. Spain was their last test. The majority of them quickly rose in rank after their return from Spain. Here are the heights reached by some of these military advisors in just a few years: R. Y. Malinovsky became a marshal and minister of defense of the USSR; K. A. Meretskov became a marshal and chief of the General Staff; G. I. Kulik became a marshal and the Deputy People's Commissar of Defense of the USSR; N. G. Kuznetsov became admiral of the Soviet fleet, minister of the navy, and for the duration of the entire war he was a member of the Supreme High Command.¹²

And in addition to over twenty future Marshals, Generals of the Army, and Colonel Generals, over forty of those who fought in Spain later became lieutenant generals, vice admirals, major generals, and rear admirals.

Despite all the efforts put forth by Stalin, Communist victory in Spain was impossible. There were many reasons for this. First of all, over 80 percent of Spanish soldiers and officers fought on the side of the uprising. Even the Communists acknowledged this. And this speaks to the fact that the uprising was not just purely originating from the generals. Spanish soldiers and generals had a choice, and the majority of them fought against the Republic. This, in turn, signals that not everything was all right in the Spanish Republic. Secondly, Spain is a long way from Russia. Stalin could not send to Spain any of his divisions. Even if he did, it would have been impossible to supply an entire division. The third reason for defeat was that the Communist party in Spain was extremely weak. It was forced to make alliances with other parties. The Communists' main allies were the anarchists. In regions where they managed to take control, they abolished currency and made all private property public. The general secretary of the Communist Party of Spain, Dolores Ibárruri, describes her allies in the war in the following manner: "The anarchists organized something like a reign of thieves."¹³ Marshal of the Soviet Union Meretskov, who fought in Spain, calls the anarchists "jolly butchers." Even if Communists themselves had been angels, they were still destined for defeat with such allies.

It is impossible to win without allies, but with allies like those winning was even more impossible. On March 28, 1939, Madrid fell—the last bastion of the Republic.¹⁴ As a result of an almost three-year-long war, General Franco had won. Soviet military advisors were evacuated.

I have always been concerned about the coincidences in timing in this whole history. The war in Spain was a sort of prologue of World War II. The battles in Spain ended, and five months later a new war began, which spread throughout all of Europe and then throughout the world. Was there a link between the war in Spain and World War II? And if yes, what was it?

When I was sixteen years old, studying military history at a military boarding school, we students were urged to read a book by Chief Marshal of Artillery N. N. Voronov. The book is very interesting. Voronov commanded the entire artillery of the Red Army during World War II. He was one of the first to interrogate General Field Marshal F. Paulus in the ruins of Stalingrad. In all of German history, field marshals had never been taken prisoner. Paulus was the first. Even aside from this one episode, there are a lot of interesting moments in Voronov's book. The book is written in a simple and lively fashion. Voronov had fought in Spain as well. Suddenly, one phrase in this book not only touched me, it wounded me: "The events in Spain deeply upset the Soviet people. Very crowded meetings and gatherings of workers took place in Moscow and other cities. [The] Soviet people expressed their brotherly

solidarity with the Spanish people, who were fighting against wild bands of fascists. During a short time workers and farmers donated millions of rubles to raise funds for the Spanish fighters.”¹⁵

I was shocked by this. In 1936, the Soviet people watched anxiously events in remote Spain, expressed outrage at the actions of the insurgents, held meetings of workers in factories and peasants in the fields, and gathered their hard-earned kopeks to help the Spanish people. Meanwhile, three years before this, the Soviet Union had been ravaged by a terrible famine, which was accompanied by cannibalism and the eating of cadavers. And this did not cause any anxiety to the Soviet people. They did not hold meetings, nor did they collect aid. Soviet people were not upset by the simple fact that their brothers, sisters, and neighbors were dying of hunger by the millions, while Stalin exported grain abroad by the millions of tons. Our people carry responsibility for all the people in the world, while being completely irresponsible toward their own. In 1936 in Spain there were no concentration camps, hostages were not yet being executed, but still the Soviet people were terribly upset and anxious. Meanwhile, slave labor flourished in the Soviet Union, millions of people were in concentration camps and prisons, and this did not upset the Soviet people or make them anxious in the least. On December 27, 1932, internal passports were introduced in the Soviet Union, without which it was impossible to work, find a place to live, or move about around the country. The passports were introduced in the midst of hunger, in order to more effectively counter the flight of the peasant population from starving regions into cities or into more prosperous parts of the country. These passports were handed out only to city dwellers. But the peasants, who comprised the majority of the population, were not supposed to get a passport. The Soviet peasant was relegated to the position of a slave who could not leave his owner. And Stalin’s military advisors, future generals and marshals, instead of fighting for the freedom of their own people, strove to fight for the freedom of Spanish peasants, who unlike the Soviet ones were free and had the right to go anywhere they wanted, including abroad.

Everything I read about the war in Spain surprised me. Here is an example of a fact that at first glance seems of little importance. The most important advisor to the Republican army was Yan Berzin, commander of the 4th Directorate of the General Staff of the Red Army.

What was the 4th Directorate? In the early 1960s the Soviet Union experienced an almost hysterical wave of laudation for the Soviet intelligence agent Richard Sorge. Films and television programs about him were aired, books and articles were published, lectures read, his name was given to streets and places, and projects for monuments were widely discussed. It was declared that Richard Sorge was recruited and trained by Jan Berzin, the chief of the 4th Directorate of the General Staff of the Red Army. Right away, it was explained to the people what the 4th Directorate was. It was the name given to the military intelligence service of the Red Army in the 1920s and 1930s. Now this organization is denoted by three letters—GRU, which in Russian stand for Main Intelligence Directorate of the General Staff of the Soviet Armed Forces. But why was the head of all Soviet advisors in Spain the chief of intelligence and not some experienced field commander?

During the course of the war, several thousand children of Spanish Communists were transported to the Soviet Union. This is a special and tragic story. They were trained to become fighters on secret fronts during the Cold War in Latin America and Africa. They served as secret agents and special forces. One group was assigned to protect and keep a watchful eye on Fidel Castro. The fate of foreign volunteers in Spain is no less interesting.

Immediately upon arrival in the country, their passports and all other documents were taken away from them. Once he had become part of an international brigade, a volunteer ceased to be a volunteer. He turned into an armed slave, for whom escape was virtually impossible. Somehow, for some reason, fires occurred more frequently in buildings in which the volunteers' documents were kept, and the cars that transported these documents were more frequently in the line of fire. As the result, the majority of fighters from international brigades were left without any documents, while the Soviet intelligence network received real passports and other personal documents for thousands of young men from fifty-four countries. These documents were used by the Military Intelligence to provide authentic identity documents for illegal agents and to improve Soviet document falsification techniques.

Antonov-Ovseenko was called back from Spain to Moscow, arrested, and executed. Yan Berzin returned from Spain to his post as head of the Military Intelligence but soon after was also arrested and executed. Meanwhile, the military advisors who really were fighting, not dealing with politics and espionage, rapidly climbed to the peaks of military power. Some of them fell under Stalin's axe but for other mistakes and errors, not for Spain.

Stalin did not count on military victory in Spain, and understood that it was impossible under such conditions. What was he fighting for? This is no riddle. It is enough to look at the actions of Stalin's diplomats and propaganda from that time period. Three countries with totalitarian regimes—Germany, Italy, and Portugal—were helping General Franco. The Spanish Republic, on a state level, was being helped by the Soviet Union alone. Great Britain and France had policies of nonintervention in Spain's affairs. Soviet propaganda screamed in outrage: children are dying in Spain, while France and Britain issue no reaction! Soviet propaganda scorned Britain and France and accused them of heartless indifference to the fates of Spanish children. Many Communist historians in Russia still cannot forgive Britain and France for their policies of nonintervention. How could they calmly have watched the suffering of the Spanish people? How could they have stayed on the sidelines, while Spanish children were dying?

But the issue was not the fate of children. (In the Soviet Union, Stalin enacted a law on April 7, 1935, that made the death penalty applicable to children aged twelve and older.) Stalin's most obvious goal, which was expressed clearly and openly, was to draw Britain and France into the Spanish war. If this plan had been successful, then a great clash between Germany, Italy, and Portugal on one side and France and Britain on the other would have occurred in the far west of the European continent, on Spanish territory. The Soviet Union was far away. Stalin's advisors and "volunteers" would also have fought, but the war would never have touched the territories of the Soviet Union. All Stalin had to do was pour fuel into a war that was heating up. The international volunteers from fifty-four countries were also a part of his plan. Stalin's agents all over the world agitated honest young men to go to Spain. Stalin was generous with money to fund the agitators, paid for the travels and living costs of the volunteers, and armed the international brigades. His plan was simple: to draw citizens of the entire world into war. First separate citizens, then entire groups, and then the governments of the various nations would have been forced to rescue their citizens. This would have meant a conflict, one way or another, with the governments of Franco, Hitler, Mussolini, and Salazar.

But the war in Spain never went beyond its borders. All the efforts of Stalin's political agents, diplomats, and spies were not enough to spread the Spanish fire throughout Europe. Stalin did not blame his generals, because military victory could not be expected. But he

did blame his spies and diplomats for not expanding the war in Spain to the rest of Europe. That is why Berzin, Antonov-Ovseenko, and the rest were executed. After this failure, Stalin drastically changed directions. By the end of 1938, when the war in Spain was clearly quieting down, when the defeat of the Communists became obvious, the exiled Trotsky in distant Mexico sensed the change in Stalin's politics. He warned the entire world about this. In November 1938, Trotsky wrote: "Stalin finally untied Hitler's hands, as well as [those of] his enemies, and pushed all of Europe towards war."¹⁶ This was written a month after the British premier, Lord Chamberlain, upon return from Munich, joyfully waved around a piece of paper and declared that he had brought peace. Trotsky wrote these words when Mussolini still considered himself a peacemaker, and Hitler had not yet issued a directive about preparations for the invasion of Poland or France.

In these sweet months, Europe drew a breath of relief and believed that there would be no war, while Trotsky already knew that it would soon come, and knew who would be responsible for it. In order to fully believe Trotsky, let us listen to another one of his prophecies, uttered on June 21, 1939. At that time intense talks between Britain, France, and the USSR against Germany were under way. Nothing hinted at the possibility of any sort of unanticipated event or complication. Trotsky, however, warned: "The USSR will move its entire mass towards the borders of Germany precisely at the moment when the Third Reich will be drawn into a fight for a new division of the world."¹⁷

Everything happened just as Trotsky had predicted. In the next year, 1940, Germany fought against France, while Stalin "with all his masses" crushed the neutral countries on his western borders, making his way toward Germany. Even now, over sixty years later, having read Trotsky's generalizations and predictions and appraised their accuracy, we have to ask: how could he know all this? Trotsky did not keep any secrets. He was the organizer of the Communist takeover of Petrograd in 1917, he was the creator of and a former commander of the Red Army, the Soviet representative at Brest-Litovsk, the first leader of Soviet diplomacy, a former leader of the USSR, and a former helmsman of the World Revolution. He knew better than anyone the nature of Communism, of the Red Army, and of Stalin. Trotsky said that all his predictions were based on open Soviet publications. Trotsky was the very first in the world to understand Stalin's game, which was not understood by the Western leaders, and which at first was not understood by Hitler.

Stalin's game, however, was very simple. Trotsky himself was the victim of such a game, which is why he understood it. Stalin, in alliance with Zinovyev and Kamenev, removed Trotsky from power in the Soviet Union. Then, in alliance with Bukharin, he removed Zinovyev and Kamenev. Then he removed Bukharin as well. Stalin removed generations of Dzerzhinsky's secret police henchmen through the hands of Genrikh Yagoda. Then Yagoda and his generation were removed through the hands of Nikolai Ezhov. Then Stalin removed Ezhov and his generation through the hands of Lavrenti Beria, and on and on it went.

Stalin continued his game on the international arena as well, and Trotsky could see this. German Nazism for Stalin was an instrument that could be used to crush the democratic regimes in Europe through Hitler's hands, and then finish Hitler off.

German Nazism could start a war, and the war could grow into a revolution. For Stalin, Hitler was a purifying storm over Europe. Hitler could do that which was inconvenient for Stalin to do himself. Stalin's politics were extremely simple. In Spain, he was unsuccessful in bringing Germany to a clash with Great Britain and France. But the hope

was not lost, because they could be brought to a clash in Poland. So in the end of 1938 Stalin drastically changed all his propaganda. All anti-Hitler propaganda in the Soviet Union was brought to an abrupt stop. Now Stalin's priority was to calm Hitler: go to Poland, I will not be in your way.

When I was very young, I was surprised by an image: two generals are standing and smiling. One is Hitler's general, the other Stalin's. This photo was taken in September 1939, during the joint Soviet-Nazi parade commemorating the bloody division of Poland between Stalin and Hitler. I was drawn to this shot like a magnet. The German general was the famous tanker Guderian. He has a friendly smile. But this does not mean anything. Behind the friendly smile, he obviously hides cruel intentions. But who is this naïve Soviet commander? Why is he smiling? Obviously, he was fooled by the Nazis. The naïve Soviet commander was Brigade Commander S. Krivoshein. And if Krivoshein had pleasant conversations with a Nazi, this does not at all mean that Stalin's commander was fooled by the German. In his memoirs, he told of the mood among his subordinates: "We made a pact with the Germans, but this does not mean anything. . . . Now is the best time for a final and constructive resolution of all world problems."¹⁸

The joint Soviet-Nazi military parade was such an unexpected and unusual event that no Soviet commander would take the challenge of developing specific details of such a parade. Before making any decision any military officer would make sure that his superior officer approved and supported it, and the superior would do the same with his higher command. In any case all the details were supposed to be immediately reported to and vetted by Stalin. In this particular case we shouldn't blame Soviet military officers for lack of initiative or for being incapable of making decisions on their own. After all, the joint military parade is a political military manifestation of the intentions of both nations to the rest of the world. No one can do this without the clearance of every single detail at the highest political level. This is why we have every reason to believe that from the Soviet side the chief stage director of this show was Stalin; nobody else would ever dare to take such responsibility.

At that point Stalin was not afraid of Hitler. In August 1939 Stalin cheated him, and in September Stalin was openly making Hitler look ridiculous. The German side was represented by Panzer general Heinz Guderian. His rank was equal to lieutenant-general, and at the time he was a corps commander. According to military-diplomatic etiquette and traditions, the Soviet side was supposed to be represented by a commander of equal rank. But Stalin sent Semion Krivoshein, who was a brigade commander and whose rank was *Combrig*—two ranks beneath Guderian. There were plenty of senior Soviet military officers in Brest at this moment whose rank equaled that of Guderian, including the 4th Army commander, *Comcor* Vassiliy Chuykov. But Stalin decided to send a low-ranking *Combrig* for the joint parade.

Stalin's message to Hitler was simple: you sent a corps commander to greet me, but you were only worthy of being greeted by a simple *Combrig*.

And that was not all. Stalin opted to send a brigade commander who several months prior was in Spain, where he bravely fought against German Panzers. To rub it in, Stalin decided to humiliate Hitler further—Semion Krivoshein, the commanding Soviet officer of the joint Soviet-Nazi military parade in Brest, was Jewish.

The majority of contemporary historians believe that Stalin was afraid of Hitler and was trying to avoid giving him any reason for attack. Stalin's attitude in September 1939 proves the opposite.

Stalin's Trap for Hitler

According to this agreement, it turned out that Hitler started the war. This was beneficial for us from the military and from the moral standpoint. With his actions, he would provoke war with France and England, by going against Poland. We could remain neutral.

—N. KHRUSHCHEV

Stalin turned out to be a rare strategist who planned history, a phenomenal tactician who organized victories under a foreign flag and with foreign hands.

—A. AVTORKHANOV, *ORIGINS OF PARTOCRACY*

In the beginning of May 1939, on the border between Mongolia and China near the river Khalkhin-Gol, an armed conflict occurred between Soviet and Japanese troops. Mongolia was under Soviet control. The adjoining Chinese territory was occupied by Japan. The clash of Soviet and Japanese troops turned into battles, fought with the use of aviation, artillery, and tanks. Nobody declared war, but the intensity of armed operations grew. On June 1, 1939, the government of the Soviet Union officially declared: "We will defend the borders of the Mongolian People's Republic as we defend our own."¹

Actions went according to those words. Precisely on that day, June 1, 1939, the deputy commander of the Byelorussia military district G. K. Zhukov was summoned from Minsk to appear in Moscow. On the following day, Zhukov flew out of Moscow to Mongolia. There, he took command of the Soviet and Mongolian troops and defended Mongolia from Japanese aggression just as he would have defended the territory of his own country.

Stalin ordered Soviet troops in Mongolia to be armed with the most modern weapons. Upon a direct order from Stalin, a group of the best Soviet pilots, who had battle experience in Spain and China, was sent to Mongolia. Each pilot had in previous battles shot down at least ten enemy planes. The Soviet pilots managed to turn the situation to their advantage and established air superiority above the theater of operations. On August 20, 1939, in the Mongolian sky, five Soviet I-16 fighters for the first time successfully used air-to-air RS-82 rocket missiles, equipped with remote detonators.²

Each side increased its power. Soviet troops under Zhukov's command were united into the First Army group. The Japanese forces formed the Sixth Army. During the course of endless exhausting battles, Zhukov prepared a radical solution to the problem—a sudden, crushing defeat of the Japanese Sixth Army.

Meanwhile, the tensions in Europe rose. Hitler demanded a review of the Versailles Treaty. In accordance with this treaty, Eastern Prussia was separated from the main part of Germany, and the city of Danzig was declared a free city. Hitler demanded to be given a corridor through Polish territory to build a highway and a railroad between Eastern Prussia and mainland Germany. Additionally, the city of Danzig was to become a part of Germany. The Polish government refused to satisfy Hitler's demands. Great Britain guaranteed Poland's safety. Treaties guaranteeing mutual aid were signed between Great Britain, France, and Poland. The governments of Great Britain and France decided to attract the Soviet Union to their side. This was a monstrous and fatal mistake.

If the USSR had been interested in safeguarding peace in Europe, it would not have needed agreements with Great Britain and France. Stalin could have solved the problems of Europe's safety on his own. He only had to make his position clear to Hitler: If Hitler were to begin a war against Poland, then he would not receive Soviet oil, grain, cotton, iron ore, magnesium, chrome, zinc, nickel, and tin. Without these things, Hitler could not have fought. It was possible to give an even harsher ultimatum: to declare independently of Britain, France, and Poland that the Soviet Union would defend Polish territory from German aggression as if it was its own, as it defended Mongolian territory from Japanese aggression. It would not matter that the Polish government might not wish to have Soviet troops on Polish territory. When Germany crushed the Polish army and dismantled the Polish government, the Red Army would step into Poland and fight Germany. An invasion of Poland by the Germans would be a signal for the Red Army to get ready for action. After the fall of the Polish state, the Polish people would continue resistance, and would accept any help which the Soviet Union would be willing to give in unlimited quantities.

In the summer of 1939 Hitler should have been reminded that Soviet pilots, sappers, tankers, artillerymen, and saboteurs fought in Spain against German military specialists. There the war lasted almost three years. Sending soldiers and arms to Spain was difficult. Poland was not Spain. Poland was much nearer. The Soviet Union could send any number of "volunteers" to Poland—5 or 10 million, plus any number of tanks, airplanes, and artillery. Hitler should have been told that in the event of aggression against Poland, the Soviet Union would give asylum to Polish refugees, would take in any number of Polish children, would offer training to Polish partisans and supply them with necessary equipment. In this case, war against Poland could not be a lightning war. It would be a war of attrition, and Germany did not have the resources for such a war. That is how Stalin should have behaved. But he, for some reason, insisted on having talks with Great Britain and France.

If a novice player sits down to play cards with a pro, he usually makes only one mistake: he picks up his cards. . . . On August 11, 1939, British and French delegations arrived in Moscow for talks about joint action against Germany. The governments of Great Britain and France repeated the mistake of novice card-players. They sat down at the table with Stalin's pros, and lost the talks. Neither the British nor the French envoys understood Stalin's intentions. Stalin's plan, in fact, was very simple: force France and Britain to declare war on

Germany, or push Hitler to actions that would prompt France and Britain to declare war on Germany.

Having received approval from the British and French governments for talks, Stalin immediately found himself in a situation in which he could not lose. For Stalin, two options were open: either the Soviet delegation would set new demands and force Britain and France to start a war against Germany; or Britain and France would refuse to invade Germany, the talks would fail, and it would be possible to accuse Britain and France of being too lax on the aggressor, while Stalin himself could sign a pact with Hitler.

The Soviet delegation set forth insatiable demands: We have no common border with Germany, so our troops need corridors through Poland!

This demand was unacceptable for Poland, and unnecessary for the Soviet Union. It was unacceptable because the Polish government and people knew the nature of the Red Army and the Soviet secret police. In 1920, the Polish people saw the Red Army on their land, and understood that a new arrival of “liberators” would turn into occupation, mass shootings, and terror against all layers of society. Several months after these talks, Estonia, Latvia, and Lithuania allowed the placing of Soviet garrisons on their territories—and fell into Communist slavery, which lasted half a century. If Stalin wanted peace, why did he need corridors in Poland? K. E. Voroshilov, then a member of the Politburo, the People’s Commissar for Defense, and a Marshal of the Soviet Union, declared at the talks: “Since the Soviet Union has no common border with Germany . . . there are no roads for engaging the aggressor.”³

The absence of common borders with Hitler’s Germany was a great asset for the Soviet Union. If the Soviet Union was thinking in terms of defense or neutrality in case of war, the Red Army needed no corridors to pass through Polish territory. But Stalin was not planning on defense, and certainly not planning on staying out of the war. He needed corridors through Polish territory on one hand in order to establish a Communist regime in Poland, and on the other hand because the corridors enabled him to deliver a surprise attack to Germany from the rear, in case it became engaged in a war against France and Britain. No other use for passages through Poland can be thought of.

There were other proposals from the Soviet side: Let France and Britain start a war against Germany not only in the case of direct German aggression, but in case of “indirect aggression.”⁴ What “indirect aggression” meant only Stalin and his diplomats knew. If the proposals of the Soviet delegation had been accepted, Stalin (justifiably) could have demanded that France and Britain start a war against Germany in response to any action by the German government. The wording was very loose, and anything can be labeled “indirect aggression.” The scenario of war in this case was simplified: in answer to an action by Germany, France and Britain, according to Stalin’s demands, were forced to act against her. The Soviet Union would act against her as well, but on Polish territory not on its own—very convenient and safe.

In any event, the main theater of operations would unfold between France and Germany, and then fresh Soviet troops would carry out decisive strikes into the rear of German forces through the Polish territories.

During the course of the talks, the French and British delegations, wishing to prove the seriousness of their intents, gave the Soviet side very important information that should not have come into Stalin’s possession.

Stalin knew that Great Britain and France had given their guarantees to Poland. But how serious was their word? The French and British delegations let him know that it was serious! If Hitler started a war against Poland, Great Britain and France would declare war against Germany. This was exactly the information Stalin was waiting for. Hitler thought that his invasion of Poland would go unpunished, like the entrance of German troops into the Rhineland demilitarized zone, like the *Anschluss* (union) of Austria and Germany, like the taking of Czechoslovakia. Stalin now knew that Hitler would be punished for invading Poland. The key to the ignition of World War II fell into Stalin's hands. It remained for Stalin only to give Hitler the green light: Attack Poland, I will not act against you (but France and England will declare war on you).

Half a century later, Soviet generals slowly started to admit that Stalin and the Red Army opened the way for Hitler to invade Poland. Army General A. Mayorov: "In planning the invasion of Poland, Germany feared most of all the Soviet Union, not England and not France. That is precisely why fascist leaders hurried to conclude a pact about [the] invasion with the USSR."⁵

The head of the GRU, Army General P. I. Ivashutin, expressed this sentiment more clearly: "With this pact, Hitler untied his hands for aggression."⁶ Simply stated, if Stalin had not signed a pact with Hitler, there would have been no invasion of Poland, and there would have been no World War II.

If Stalin had wanted peace, in August 1939 he had many opportunities to avert war. One of them was to follow the example of Britain and France and give a guarantee of safety to Poland. Or, he could simply have drawn out his talks with Britain and France, which would have served as a warning to Hitler: Invade Poland, but keep in mind that all of Europe is against you, we are gathered here in Moscow talking about something, and all we have to do is blockade Germany. But Stalin chose his own way. On August 12, 1939, the military delegations of the USSR, Great Britain, and France began talks in Moscow. Stalin's Marshal Voroshilov openly conducted with France and Britain the talks on "containing Hitler's aggression in Europe." Behind the scenes, however, things happened very differently: On August 11—even before the talks got started—Stalin made a decision to start negotiating with Germany for the partition of Poland.⁷ Stalin showed the world his willingness to stop Hitler's aggression, but simultaneously (and even beforehand) offered the German dictator a friendly and helping hand. Thus, Stalin safeguarded himself from failure, no matter what happened. Britain, France, and Germany were clearly about to engage in a massive struggle. Stalin kept up, openly or secretly, friendly relations with all the participants in this struggle and at the same time incited them to act more and more aggressively.

On August 19, 1939, Stalin made a series of extremely important decisions, which had consequences for the course of world history. On that day, Stalin decided to stop the talks with Britain and France. On that same day, the German ambassador to Moscow, Friedrich von der Schulenburg, received Stalin's draft of the impending mutual agreement with the directions that "the agreement will be in force only given the simultaneous signing of the special protocol on points of interest to the Agreeing Parties, regarding foreign policy."⁸ Hitler didn't know that signing this agreement signified the start of World War II. Stalin did.

On that same day, August 19, according to Stalin's orders the Soviet Union began a mobilization of the Red Army. Earlier, Stalin had given firm approval of conducting a sudden crushing operation to defeat the Japanese Sixth Army in Mongolia. On August 19, 1939,

a coded cable from Zhukov informed Stalin that the main goal had been reached, that is, that the Japanese did not suspect the impending attack. Stalin gave his final approval, and Zhukov crushed the Japanese Sixth Army. Zhukov conducted a brilliantly sudden, quick, and audacious operation. The lightning-speed defeat of the Japanese Sixth Army was a prelude to World War II.

On that same day, August 19, 1939, a secret meeting of the Politburo took place, at which Stalin gave a speech. This meeting of the Politburo has never been reported. On the contrary, a lot of efforts were made to convince the whole world that such a meeting never took place. Stalin himself told the newspaper *Pravda* on November 30, 1939, that any report of a meeting of the Politburo on August 19, 1939, "is a sheer invention and lie."

Years went by. The Soviet Union rotted and fell apart. Archives opened slightly. The advisor to the Russian president, Colonel General D. A. Volkogonov, published an article in the newspaper *Izvestia* on January 16, 1993: There was a meeting of the Politburo on August 19, 1939. The general had [the] protocols in his hands. General Volkogonov says that only secondary questions that were discussed at that meeting are preserved in the archives. But even this revelation meant an end to public lies. With one line in a newspaper article, general Volkogonov disclosed the lies of all Soviet leaders, including Stalin.

In the meantime, more brave and more truthful scientists continued the search. And the document was found. It was kept in the Special Archives of the USSR, fund 7, index 1, document 1223. Tatyana Semenovna Bushueva, a talented Russian historian, found it. The document was first published in the December 1994 issue of *Novyi Mir*. This document finally proved that there was a meeting of the Politburo on that date. It turned out that Stalin did indeed speak on that date, and not about secondary problems, but about most vital ones. The document reveals that Stalin spoke of matters of primary, not secondary, importance.

The Russian historical community still denies the validity of this document, claiming it is unclear how and when the document was made. On the other hand, many recently declassified documents support the validity of this account. Let's look at, for instance, a record in the diary of the general secretary of the Comintern, Georgi Dimitrov, made on September 7, 1939. In the company of Molotov and Zhdanov, Stalin explained his new line of foreign policy to the leader of the Comintern: "The war is between two groups of capitalist nations . . . but we are not against it, if they fight a bit and weaken each other. It would be good if Germany could destabilize the positions of the wealthiest capitalist nations (of England especially). Hitler, without knowing it, is weakening the foundations of the capitalist system. . . . We, in the meantime, are able to maneuver, to nudge one country on against the other, so that the fight will be more intense."⁹

Below, as a source of comparison, are several excerpts from Stalin's speech at the Politburo session from August 19, 1939: "If we accept Germany's proposal about the conclusion of a pact regarding invasion, she will of course attack Poland, and France and England's involvement in this war will be inevitable. Western Europe will be subjected to serious disorders and disturbances. Under these conditions, we will have many chances to stay on the sidelines of the conflict, and we will be able to count on our advantageous entrance into the war. . . . It is in the interest of the USSR—the motherland of workers—that the war unfolds between the Reich and the capitalist Anglo-French block. It is necessary to do everything within our powers to make this war last as long as possible, in order to exhaust the two sides. It is precisely for this reason that we must agree to signing the pact, proposed by Germany, and work on making this war, once declared, last a maximum amount of time."

In 1924, Hitler wrote in his book *Mein Kampf* (Chapter XIV): “Already the one fact of concluding an alliance between Germany and Russia would mean [the] inevitability of a future war, the outcome of which would be predetermined. Such a war could only mean the end for Germany.”¹⁰ Fifteen years went by, and on August 19, 1939, Prime Minister and People’s Commissar for Foreign Affairs of the USSR Vyacheslav Molotov, on Stalin’s orders, handed to the German ambassador in Moscow von Schulenburg a plan for the nonaggression pact. Stalin’s proposals were so attractive that Hitler accepted. Hitler correctly predicted his fate. As he foretold, the alliance with Moscow meant inevitable war, the outcome of which was predetermined. This war meant the end for Hitler’s Germany.

Results of the Moscow Pact

Stalin was craftier than Hitler. Craftier and more sly.

—A. ANTONOV-OVSEENKO

On August 23, 1939, Germany and the Soviet Union signed an agreement in Moscow about the destruction of the Polish state and the division of the Polish territories. Poland had mutual assistance agreements with France and the United Kingdom and, therefore, the attack by the Soviet Union and Germany automatically led to a European—and hence world—war. Indeed, in eight days, on September 1, 1939, World War II broke out. It was a direct and unavoidable result of the agreement reached in Moscow.

The USSR-Germany agreement is traditionally called the Molotov-Ribbentrop Pact. This moniker misleads and does not truly reflect the essence of what happened. The pact that was signed in Moscow was a plot between Hitler and Stalin to conduct an aggressive war in Europe together. Therefore, that agreement in effect was a Stalin-Hitler pact. Furthermore, in international practice it is much more common to use not the names of the statesmen that concluded the agreement, but the place where the documents were signed: the Munich Agreements, the Warsaw Pact, the Baghdad Pact, and the Geneva Agreement. Therefore, in accordance with common diplomatic practice, the more precise name of the pact would be the 1939 Moscow Agreement on the Start of World War II. Both parties received approximately equivalent shares—part of Poland went to Hitler, the other part went to Stalin. However, just eight days after signing the Moscow pact, Stalin violated it. Hitler started a war of aggression against Poland with hope that his ally Stalin would do the same. But Stalin cheated Hitler. On September 1 and in the subsequent two weeks the Soviet troops stood next to the Polish borders without conducting warfare and crossing the borders. The explanation of the Soviet government to the German counterpart was: the time has not come yet for action by the Red Army. As a result, the entire fault for the beginning of the war fell upon Germany, upon Hitler and his entourage. They entered world history as the chief and only cause of World War II. Poland was divided not in the Imperial Chancellery, but in the Kremlin. Hitler was

not present, Stalin was. But Hitler is at fault for the starting of the war, while Stalin is not. Stalin entered history as an innocent victim and the liberator of Europe.

The invasion of the German troops into Poland had other consequences too: on September 3, 1939, Great Britain and France declared war on Germany. Already on the third day Germany was involved in a two-front war; that is, it wound up in an unwinnable situation. Since Germany practically lacked strategic raw materials, the two-front war was fatal for Germany.

Lack of raw materials not only prohibited Germany from conducting a two-front war, but also a prolonged single-front war. The only hope was for blitzkrieg—instant defeat of the opponent. France could be defeated in a lightning war, but Great Britain is an island nation. To defeat Britain, long and serious preparation is needed, as well as a powerful navy that is equal to or exceeds the British navy, and air dominance is needed too. The German navy lagged significantly behind the British navy. German air power was insufficient to crush British industry and achieve air superiority. Therefore, on the third day the war already looked long and unpromising for Germany.

Furthermore, Britain had a special relationship with the United States. The United States could side with Britain at any moment that was convenient. Germany did not have such allies. Only while he was in a position of power could Hitler rely on Stalin's friendship. In a prolonged war against Britain and her allies, Hitler would inevitably exhaust his resources. In September 1939, the German government repeatedly reminded the government of the USSR about their obligation and demanded the Red Army's invasion of Poland according to the agreement. The Soviet government would refuse—not right away, but with a two- to three-day delay. For example, in response to the German demarche of September 3, the head of the Soviet government and its foreign minister, Vyacheslav Molotov, responded on September 5: "We agree with you that concrete action has to be taken at an appropriate time. However, we consider that such [a] time has not come yet. It is possible that we are mistaken, but it appears to us that excessive haste could cause us harm and facilitate unification among our enemies."¹

The German government kept repeating its demands and kept getting refused. Red Army units started military action in Poland only after two and a half weeks—September 17. Stalin's troops committed similar, or maybe even worse, atrocities in Poland, but Great Britain and France did not declare war on the Soviet Union. Great Britain, France, and their allies were interested in preventing Germany from using Soviet strategic resources. To do so, it was necessary to keep Stalin at their side at any cost and, in case of war between Germany and the Soviet Union, to keep the Red Army from being defeated.

As a result of the pact signed in Moscow in 1939 Stalin achieved a war, one which he desired and for which he had planned and prepared for a long time: The nations of Western Europe were mired in a destructive war, but the Soviet Union remained neutral. Now Stalin could wait for the total exhaustion and self-destruction of Central and Western Europe. Hitler guessed Stalin's intentions and in 1941 suddenly and almost fatally struck the Soviet Union. In this critical situation, Stalin received free aid from the United States and Great Britain, which in volume and quality did not have a historical precedent. At the same time, the Soviet role in unleashing World War II was quickly and thoroughly forgotten. In the final count, Poland, for whose freedom the Western European states had entered World War II, did not gain its freedom, but was given, along with all of Central Europe and part of Germany, into Stalin's control.

It is customary to consider Britain and France among the victors. However, this is clearly a mistake. The purpose for which Great Britain and France entered World War II was ensuring Poland's independence. This aim was not achieved as a result of the war; therefore, there is no cause to celebrate victory.

As a final result of the Moscow pact, Hitler committed suicide and Stalin became the unbound Red ruler of a huge anti-Western empire, created with the West's help. At the same time, Stalin managed to keep his reputation of a naïve, trustful simpleton, and Hitler entered history as a duplicitous villain. It is accepted that Stalin was not ready for war, but Hitler was ready. But the one who wins the war is the one who prepares for war by dividing his enemies and making them fight each other, not the one who makes loud pronouncements.

19

Blitzkrieg in Poland and Mongolia

It was the Russians who first put forward the idea of amassing mobile units.

—COLONEL GENERAL F. HALDER, CHIEF OF GENERAL STAFF OF
GERMAN LAND ARMIES

In August 1939, on the river Khalkhin-Gol in Mongolia, aside from a crushing blow there were other possible choices for action. Soviet troops could have, for example, taken defensive positions and postponed the prepared attack. Aggression is always risky. In the event of Soviet success, Japan would receive a lesson to last for years to come. In the event of failure, the entire world would talk of Stalin's army purges and accuse him of making the army unfit for fighting. In the event of failure, Zhukov could be executed, but his blood would not wash away the military's disgrace.

On Saturday, August 19, 1939, Stalin sent to Zhukov only one code word: "Good." A few hours later, Zhukov delivered the blow. In Moscow, that historical day, August 19, had just ended, but in Mongolia the sun was already rising over a new day. At 5:45 AM, 153 Soviet bombers, under the cover of a corresponding number of fighters, carried out a surprise raid over Japanese air bases and command posts. Artillery joined in immediately. The artillery softening-up was short (2 hours, 45 minutes), but unbelievably intense and powerful. During the course of the artillery action, Soviet aviation carried out a second raid, and at 9:00 AM tank units broke through Japanese defenses. Zhukov's plan was simple. He conducted a classic operation of encirclement. Zhukov had a relatively weak center and two powerful flank groups. The center only holds the enemy, while the strike groups at the flanks do not enter into prolonged battles but go around the main centers of resistance, and determinedly head forward. On August 23, the fourth day of the attack, the circle drawn around Japanese troops was tightened, and the rout began.¹

The operation on the Khalkhin-Gol was brilliant in planning and in execution. Zhukov took a lot of risks, but they were justified. Zhukov ordered the air bases moved as close to the front lines as possible. This allowed airplanes to carry less fuel and more bombs. The intensity

of the use of aviation grew sharply: planes took off, and before they even reached cruising altitude, unloaded their bombs, quickly returned, took more bombs, and repeated the process. When Soviet tanks went far ahead, aviation could support them without relocating the bases. Zhukov moved hospitals and supply bases to the front lines as well—supplying ammunition, fuel, and everything necessary for battle was carried out quickly and efficiently, and evacuation of the wounded did not demand excessive time, so after a short time the soldier found himself on the operating table. Zhukov moved his and all other command posts to the front lines, so he was personally able to see the battlefield panorama, and when the troops moved forward, it was no effort for him to move his command post after them. During the preparations for this offensive, Zhukov forbade almost all use of radio communication. Communication was conducted mainly through wires with short sentences, which were understood only by the two people speaking. The operation was prepared in complete secrecy. Each officer received directions only within the frames of his duties and had no concept of the overall plan, the scope, or the dates of the offensive. Actually, many people did not know about the offensive at all. Zhukov fooled not only the Japanese spies but, before all, his own soldiers and officers. Until the last moment, they thought that they were preparing defenses for a prolonged period. If his own soldiers and officers believed this, the enemy surely did as well.

Disinformation gave the desired results: there had never been such a crushing defeat in all of Japanese history. The defeat of the Japanese Sixth Army on the Khalkhin-Gol had strategic consequences. Japanese aggression in the direction of Mongolia and of the Soviet Union was thwarted. Japanese generals decided to not take any more risks. Their efforts from then on were aimed in a different direction—against the United States and the British colonies. In the fall of 1941, during months critical for the Soviet Union, Japanese generals still heeded the memory of Khalkhin-Gol and did not dare attack.

Khalkhin-Gol was the first lightning war of the twentieth century; it was blitzkrieg in the purest form. It was the first time in history that large masses of tanks were used correctly: to strike in depth. This was the prime example of unseen concentration of artillery in tight areas of the front. It was an example of absolute surprise attacks—during the first hour and a half of battle, the Japanese artillery did not fire a single shot and not a single Japanese plane rose into the air.

At the time that the Soviet army was conducting its operation at Khalkhin-Gol, the German army had no experience of conducting lightning-speed offensive operations and was not even conducting any large-scale training operations using tank masses for sudden breakthrough into the depth of the enemy's defenses. The German command planned to conduct the first of such training exercises in the fall of 1939.² Due to Germany's invasion of Poland and the beginning of World War II, these training exercises were never conducted.

On August 29, 1939, Stalin gave Zhukov the title of Hero of the Soviet Union for his lightning defeat of the Japanese Sixth Army. On September 1, Germany attacked Poland. It is interesting to compare the two lightning operations: the Soviet one in Mongolia, and the German in Poland. The difference lay in the fact that the whole world witnessed the German actions in Poland. Embassies from all over the world were located in Warsaw; there were many foreigners in Warsaw and other Polish cities, many journalists in particular. They all witnessed the war and described it in their newspapers and magazines. Hitler's propaganda demonstrated to the entire world the amazing successes of German troops. The whole world

saw the menacing footage on their screens: dive-bombers roaring wildly as they flew toward the ground, dropping their deadly loads, and soaring back into the clouds, tanks breaking Polish barricades, letting through hordes of cheerful motorcyclists.

The Red Army's operation in Mongolia, on the other hand, was carried out on hot desert steppes, where there were no international observers and journalists. Few people knew about the operation at the time. For obvious reasons, the Japanese government did not rush to tell the world about the defeat of the Sixth Army in Mongolia. Surprisingly, the Soviet propaganda also did not rush to announce its victory.

During World War II, Major General D. Ortenberg was the editor-in-chief of the central military newspaper *Krasnaya Zvezda* (Red Star). He was directly subordinate to Stalin and had many meetings with him. Before the war, he was the editor-in-chief of the *1st Army Group* newspaper at Khalkhin-Gol. Major General D. Ortenberg testifies that Stalin personally forbade publishing materials concerning the defeat of the Japanese Sixth Army. "In central newspapers all materials about Khalkhin-Gol effectively went to the trash bin: there was a strict order from Stalin to not print anything about the Khalkhin-Gol events."³ We can check Ortenberg's statement ourselves. It suffices to leaf through *Pravda*, *Izvestia*, and *Krasnaya Zvezda* from those days—there is not a word about the brilliant lightning-speed defeat of an entire Japanese army!

All Soviet propaganda was extremely and severely centralized. Stalin's empire ran the most powerful and perfected system of censorship. In Stalin's empire, any printed product could be published only after a censor gave permission. Without the permission, even bus tickets could not be printed. The principle of selection of information was extremely simple: hide any defects, catastrophes, and mistakes and praise any accomplishments. The farms produced slightly more milk, dug slightly more potatoes, a new factory was built—those were the reported news. But here we have a true accomplishment: the defeat of an entire Japanese army. This was an unprecedented historical event. Nobody had ever beaten the Japanese. During the Russo-Japanese war of 1904–5 Russians had especially suffered from the hands of the Japanese. Here came a remarkable revenge, huge trophies! The Red Army opened a new chapter in the art of war. The defeat was achieved by a new, previously unseen method.

Yet, Stalin ordered silence. Why? Because he was preparing the same sort of defeat, only on a much grander scale, for all of Europe. Stalin's interest lay in concealing the might of the Red Army, keeping silent its capability for delivering crushing surprise attacks. Stalin's interest lay in letting the whole world believe in the backwardness of the Red Army and its inability to conduct modern warfare. Stalin's interest lay in catching Hitler off-guard, in not scaring him.

At first glance, the Red Army's lightning operation in Mongolia and the German blitzkrieg in Poland are not comparable in scale. The German troops participating in the invasion of Poland numbered 1.6 million soldiers and officers. The Soviet group in Mongolia numbered only 57,000 men. In numbers of people, the German operation surpassed the Soviet one twenty-eight times. However, if one looks at the number of tanks and airplanes, the numbers are comparable. The German operation against Poland had the participation of four times more airplanes, and six times more tanks, than the Soviet operation in Mongolia. The numbers are quite on the same scale.

An analysis of the quality of weapons is even more interesting. The Red Army used long-range bombers in Mongolia; Germany had no such planes.⁴ If one examines the quality

of tanks, the picture also favors the Red Army. The Pz-I was the most prevalent German tank that participated in the blitzkrieg in Poland. There were 1,445 of them. This tank had a 100-horsepower engine. Earlier models of it had 57-horsepower engines. The second in numbers was the German Pz-II. There were 1,226. The earlier models of it had 130-horsepower engines, the later models, 140-horsepower. Germany had only 98 Pz-IIIs, and 211 Pz-IVs. The first models of these tanks had 250-horsepower engines, the later ones, 300-horsepower.

In contrast, Soviet troops in Mongolia used the BT-5 tanks, with 400-horsepower engines, and the BT-7 with 500-horsepower. The sum power of tank engines used in Mongolia constituted more than half of the sum power of tank engines used by Germany in Poland. In the area of tank armament, the Red Army clearly surpassed the Germans. At Khalkhin-Gol, practically all Soviet tanks were armed with the most powerful tank cannon of that time, with 45-mm .46-caliber barrels. In addition, Soviet armored automobiles were armed with the same cannon. The German army, or any other army in the world, had nothing comparable at the time. The majority of German tanks during the blitzkrieg in Poland had no cannon at all. The Pz-I only had machine guns. The Pz-II had 20-mm cannon. The Pz-III had weak 37-mm cannon, and there were less than a hundred tanks of this model. The Pz-IV had 75-mm cannon with a very short barrel, which was not meant for and not fit for battle against enemy tanks.

In 1939, the same arms gap could be seen between the Red Army and the *Wehrmacht* in terms of artillery. Germany entered World War II with field artillery developed in the time of World War I, while the Red Army had the best cannons, howitzers, and mortars in the world, developed right on the eve of World War II. For every thousand German soldiers during the blitzkrieg in Poland there were less than two tanks. For every thousand Soviet soldiers in Mongolia there were almost nine much more powerful tanks. In other words, Soviet troops at Khalkhin-Gol formed a relatively small army, but were equipped to the limit with the most modern and sophisticated weapons.

There was also a big difference in the conditions under which the operations were conducted. In September 1939, the conditions for conducting a lightning war in Poland were superb. A continuous defense by the Polish army along the perimeter of the country was impossible. Poland, to its misfortune, was an ideal location for the demonstration of tank capabilities. Western Poland formed a wide protrusion, surrounded on three sides by German territory. Its border with Germany stretched two thousand kilometers; after German occupation of Czechoslovakia, the German-Polish border increased by another eight hundred kilometers.⁵

The German army did not have to break through defenses. Ahead of it lay flat terrain, ideal for advance and totally unfit for defense. The river Vistula flows through Poland, but there was no need to cross it. Hitler's troops were located on both sides of the Vistula. There were no other serious water barriers. An attack on Warsaw could be carried out from any direction. The distance from mainland Germany to Warsaw was 230 kilometers, and from the border of Eastern Prussia to Warsaw was 110 kilometers. This meant that there was no need to relocate supply bases—troops could be supplied from stationary bases built during peacetime. There was no need to transfer thousands of tons of ammunition, fuel, and other equipment. In theory, a thrust on Warsaw could be carried out without refueling tanks. Fill up the tanks in Germany, and go! There were no defenses ahead, since they were impossible. There was no need to set up field hospitals, because the wounded could be taken to stationary

peacetime hospitals. Aviation bases also did not need to be moved—the air force could conduct its missions from permanent air bases. Command posts with communication lines also stayed in place in underground bunkers. Only small mobile groups of commanders needed to be sent forward.

However, not everything in Poland went as smoothly as shown in Goebbels's propaganda and as described by some modern followers of Hitler. For some reason it is not popular to speak of this, but the German blitzkrieg in Poland failed. On September 15, 1939, two weeks after the start of World War II, the activity of the German air force substantially dropped; the German army was almost completely out of fuel. This was the level of Hitler's and his generals' understanding of modern warfare.

Forget all the tales by Soviet marshals and academics that the Red Army entered Poland in 1939 out of fear that the Germans might go straight for Moscow. Hitler did not have such strength. Even if he headed for Moscow in October 1939, the same exact thing would have happened to his valiant army that happened in October 1941: it would have sunk in the mud. The *Wehrmacht* lacked the fuel, bombs, and ammunition necessary to wage war against the Soviet Union. In 1939 the Red Army entered Poland for different reasons. Most importantly, there was the fear that Hitler's blitzkrieg would stop. It was already slowing down. Stalin's offensive in Poland allowed Hitler to transfer his forces from the eastern to the western front with maximum efficiency. Imagine the situation: all German tanks and cars are stopped, airplanes do not fly. The German army has many horses, though they are load-bearing horses, not cavalry. In this situation, the Polish cavalry could have shown what it means to have superiority in strategic mobility . . . but once again, Stalin saved Hitler.

From the standpoint of grand strategy the operation in Poland was a total failure for Hitler and his generals. It was the first suicidal act of Hitler's Germany: they entered a war having one enemy—Poland, and in two months brilliantly ended that war having Britain, France, India, Australia, New Zealand, Canada, and potentially the United States as enemies. A blitzkrieg cannot be used to win a war against all these nations, and Hitler had no other options. As a result of the blitzkrieg in Poland, Hitler obtained a common border with the “neutral” Soviet Union. Being at war with everyone, Hitler would have been better off having a border with Poland than with the Soviet Union—anything could be expected of comrade Stalin.

One more thing: Poland was not at all crushed by the blitzkrieg.

Immediately after the fall of the government in Warsaw, the Polish government in London was created, and it was acknowledged by most nations of the world and by the League of Nations. According to Polish tradition, underground local governments and an underground state formed on occupied territory. Armed forces were revived. Using the most cautious methods, the Polish Army counted 350,000 soldiers and officers, well trained, organized, and armed. Moreover, Poles fought against Hitler on all fronts: in Britain, France, Italy, Africa, Holland, and the Soviet Union. Starting in 1939, the number of Polish formations fighting Hitler constantly was around one million people. The blitzkrieg started in 1939 in Poland, and ended in 1945 with the storming of Berlin, in which the Polish First and Second armies took part.

We are told that Stalin purged his army, and after 1937–38 it was good for nothing. For some reason, Khalkhin-Gol and the year 1939 are forgotten.

In 1939, the Red Army received a unique and invaluable experience in breaking through powerful field defenses of the Japanese army in Mongolia. At that time not a single army in the world had such experience. From this experience, the right conclusions were drawn: even more attention needed to be given to the issue of breaking through defenses, and even more sophisticated weapons, designed specifically for this purpose, had to be developed. The experience of Khalkhin-Gol showed: if the enemy has dug himself firmly into the ground, aviation is incapable of breaking through such defenses, even if the bombing concentration is 80 tons per square kilometer. Artillery is needed. Soviet artillery was already the most powerful in the world, but from September 1939 began the unfolding of new artillery formations and the construction of new ammunition factories.

The Red Army command not only understood the extreme importance of supplying troops, but had the unique experience of doing it in the extreme conditions at Khalkhin-Gol. The Soviet troops counted 57,000 soldiers, 498 tanks, 500 guns, 385 armored cars, 515 airplanes, artillery transport, automobiles, etc. If everything necessary for life and battle was to be brought to Mongolia from the supply bases in the Baikal military district, the distance to be covered was roughly 1,500 kilometers. But not everything was in storage in the Baikal region. If supplies were to be brought from factories and central storages the distance to be covered was seven to eight thousand kilometers. The last stretch of railroad had very limited load-bearing capacity and ended in a deserted steppe. For the next 650 to 700 kilometers trucks were needed. The most common truck of that period could cover the round-trip of 1,300 to 1,400 kilometers, in good conditions, in roughly five days. The conditions were: heat, dust, no water. People might get by in these conditions, but automobile radiators need water. The troops needed to be supplied with everything. For example, wood to burn in field kitchens. Technology wear and tear was tremendous, as was fuel expenditure. Cars needed to be refueled several times along the way. Once the car had dropped off its cargo at Khalkhin-Gol, it needed to make its way back—and once again, it had to be refueled, so it turned out that the cars had to take away what they had just brought.

To this desert location the Soviets needed to supply by truck 25,000 tons of ammunition, 15,000 tons of fuel and lubricants, 4,000 tons of foodstuffs, 7,000 tons of fuel, and a lot of other cargo. All this was supplied in such a fashion that the enemy did not even suspect preparations for a sudden crushing attack. After such an operation, Soviet command quite clearly understood the meaning of supplies in war.

Nevertheless, Khalkhin-Gol played a mean joke on Stalin and the entire Red Army. In May 1940, Stalin introduced the titles of “general” and “admiral” into the Red Army. Approximately one thousand top Red Army commanders became generals. But only three of them received at that moment the top general rank—General of the Army. At that time, this meant five-star lapels. The first of these men was Zhukov. Zhukov became the first of all Soviet generals. Upon Zhukov’s return from Mongolia, Stalin entrusted Zhukov with the most powerful of his military districts—the Kiev district. In February 1941 he appointed Zhukov to the position of Chief of General Staff. In this position Zhukov prepared for the war against Germany. On the German border (only on a much grander scale) he was to repeat everything he had implemented against the Japanese army. Zhukov created two mighty mobile flank attack groups at the L’vov and Belostok bulges, and one group for an attack in Romania.

Zhukov moved air bases to the very borders, with one hundred—sometimes two hundred—planes in each location. Zhukov moved hospitals, supply bases, command posts to the borders. Zhukov moved to the border thousands of tons of ammunition, fuel, and spare parts for tanks and planes.

Zhukov forbade almost all use of radio communication. Zhukov kept his plans in complete secrecy, and very few people in the Red Army knew what was to be done. Upon the surprise enemy attack, all this had catastrophic consequences. All of Zhukov's activity in 1941 has been attributed to a series of mistakes and miscalculations. But these were not mistakes. In 1941, he was preparing against Germany exactly what he had prepared in August 1939 against the Japanese army at Khalkhin-Gol.

Mobilization

Mobilization is war, in our minds there is no other meaning for it.

—MARSHALL Y. N. SHAPOSHNIKOV, CHIEF OF THE
GENERAL STAFF OF THE RED ARMY

From time to time we find a lot of interesting materials in the archives, but we will not find what is most important. Here is why: “How many times have I told you—do whatever you want, but do not leave behind any documents, do not leave any traces.” These are the words of Stalin himself. He uttered them publicly at the Sixteenth Congress of the Communist Party. The records here note the “Homeric laughter of the entire audience.” The congress laughed heartily—comrade Stalin had made a joke. Understandably, Stalin was not talking of himself, but of his opponents, who apparently were guided by the principle of leaving behind no traces or documents. But the congress laughed in vain. Stalin always ascribed his own intentions, principles, and methods to his enemies. Soon after, Stalin executed all his enemies, as well as almost all the delegates present at the Sixteenth Congress who had laughed so heartily. He left a very minimal number of documents about these executions.

Not a single dictator can match Stalin in his ability to cover up the traces of his personal involvement in crimes. Anastas Mikoyan, who beat all records of political survival, tells us how well Stalin kept secrets. Mikoyan was a member of the Central Committee of the Communist Party from 1923 until 1976—that is, for fifty-three years, for forty years of which he was a candidate or member of the Politburo, the most important power organ of the country, which governed the entire Soviet Union and its satellites. Mikoyan describes a meeting held by Stalin: “Most often there were five people. We met late in the evening or at night, rarely in the afternoon, usually without preliminary notice. There were no protocols or records kept during the course of such meetings.”¹

Air Force Colonel General A. S. Yakovlev: “During the meetings of Stalin’s inner circle there were no stenographers, no secretaries present, no records or protocols were kept.”² Marshal of the Soviet Union D. F. Ustinov was the People’s Commissar of Arms during the

course of the war: “During the meetings and conferences conducted by Stalin, discussions of problems and the making of decisions frequently occurred without records, and often without the corresponding paperwork marking the decision made.”³ In other words, decisions were made but were not fixed on paper, just like in the Mafia.

Marshal of the Soviet Union G. K. Zhukov during the course of the war was deputy to the Commander in Chief, that is, to Stalin: “Many political, military, and general government questions were discussed and solved not only at the official meetings of the Politburo and in the Central Committee Secretariat, but also in the evening at dinner in Stalin’s apartment or at his dacha, where the Politburo members closest to him were usually present.”⁴

Colonel General B. Vannikov was the People’s Commissar of Ammunition: “At the meetings and conferences Stalin had a habit of discussing questions and making decisions without protocols or records. . . . From this it is clear that the understanding of many events just based on documents is incomplete and unclear, and in many cases incorrect.”⁵

Hitler’s meetings were known for being held in the presence of large crowds. Everything said by Hitler was fixed for history by three stenographers and a personal historian. Stalin’s meetings on the other hand were simply secret gatherings of plotters and conspirators, in spirit and in essence. No documents and no traces were left of these meetings. Therefore, as Stalin taught us, we will look not at the words, which are hidden from us, but at the actions, which are in the open.

It is possible that World War II could have not occurred. The choice was up to Stalin. He himself told this to his colleagues at the Politburo meeting on August 19, 1939: “If we make a pact of mutual aid with Great Britain and France, Germany will give up Poland and . . . the War will be averted.” Stalin did not make a pact with Great Britain and France; thereby he did not try to avert a war. This day—August 19, 1939—was a long, difficult day. This was a day filled with hopes and worries. This was the day when Stalin cast his fishing rod into the brown swamp that was Hitler’s Germany. His hook had bait for Hitler: Danzig and half of Poland. Take it! And as a free gift Germany got war against Great Britain and France.

This was the day when doubts crawled into the hearts of Stalin’s colleagues. Stalin had decided to trick Hitler. Would Hitler believe him? Stalin could not possibly always win. Vyacheslav Molotov worked on the scene as the head of the Soviet government and the People’s Commissar of Foreign Affairs. When Molotov received the German ambassador von der Schulenburg in his cabinet in the Kremlin, Stalin, Shaposhnikov, Beria, and Malenkov did not show themselves—they were behind the curtains, in Stalin’s cabinet. Molotov’s conversation with the German ambassador was transmitted to Stalin’s office. Molotov worked brilliantly. The most important thing was not to let the ambassador see Stalin’s interest in the issue of German-Polish relations. Molotov did not reveal this interest; his attitude to the ambassador was: “All right, let Ribbentrop come, perhaps we will agree on something, perhaps we will find a solution to the question of Danzig and Poland.”

After the meeting, Schulenburg went to the German embassy to write a report, while a heated discussion of the outcomes of the meeting was underway in Stalin’s cabinet. The German ambassador had barely reached the embassy when he received a call from the Kremlin: Molotov awaits you for a new meeting. This was a difficult day. And it ended in Stalin’s victory.

At dawn on September 1, 1939, the German army began war against Poland. But in the twentieth century, a war in Europe automatically meant a world war. The war quickly engulfed all of Europe and practically the entire world.

In a strange coincidence of events, it was precisely on this day—September 1, 1939—that the fourth emergency session of the Supreme Soviet of the USSR ratified the universal military draft. There had been no such law in the history of the USSR. A surprising thing: while children and adults were taught to fear Hitler, while Hitler was considered to be a tyrant and monster, the country could do without a draft. But as soon as a non-aggression pact was signed, a universal mandatory draft all of a sudden became necessary.

Why did the Soviet Union need it? Soviet historians stated that the USSR took measures of precaution. Marshal of the Soviet Union K. A. Meretskov is one of the many of those who assert that the law had a huge significance and was adopted “in the conditions when World War II had already begun.”⁶

Let us imagine the Polish-German border on that tragic morning: darkness, fog, fire, motors roaring. Very few people in Poland understood what was happening, whether this was a provocation or an unsanctioned border conflict that arose on its own. But the representatives at the USSR Supreme Soviet already knew that this was no provocation, no conflict, and no German-Polish or even European war—this was the beginning of a world war. They knew that they, the representatives, must meet in Moscow and take the corresponding measures. Why did these representatives not act so efficiently when a similar thing happened on the Soviet-German border in 1941?

On the morning of September 1, 1939, it was not only the Polish government and the governments of the Western countries that did not know that World War II had started. Hitler himself did not know it either. He started the war against Poland hoping that it would be a local fight, like the taking of Czechoslovakia. As Colonel General of the Air Force A. S. Yakovlev (at that time an aircraft designer, deputy people’s commissar of aviation industry, and personal advisor to Stalin) concluded: “Hitler was sure that England and France [would] not fight for Poland.”⁷ When, on September 3, Great Britain and France declared war on Germany, this was an extremely shocking and unpleasant surprise for Hitler. He had not anticipated this. For him, a “strange” war against Great Britain and France began on September 3. In the same month, an equally strange peace began in the East.

Any attempt to establish the exact date of the beginning of World War II and the time that the USSR entered into it brings us to the date of August 19, 1939: Stalin stretched a hand of friendship out to Hitler and signed the non-aggression pact, while on the same day he issued an order to gather the representatives of the Supreme Soviet, so that at the time World War II began they were already sitting in the Kremlin and unanimously voting in favor of everything put before them. What a strange coincidence: the road to Moscow is long—for some it takes ten to twelve days. In order to adopt the law on September 1, 1939, the order to gather the representatives was issued on August 19, meaning that on August 19, 1939, someone in Moscow already knew that in a couple of weeks World War II would begin and a new draft law would be needed.

Chief of General Staff and Marshal of the Soviet Union B. M. Shaposhnikov created the theory of mobilization. He authored the book *Brain of the Army*. The third and final volume was published in 1929, and while the Soviet Army existed, this book served as a manual for every Soviet officer and general. On Lenin’s desk, a copy of the book *Mob Psychology* by Gustav le Bon had always been present, and on Stalin’s desk it was Shaposhnikov’s *Brain of the Army*. The key to the success of Shaposhnikov’s book was in the simplicity with which the material was presented, in the crystal-clear argumentation, and in the ability to explain

the most complex problems in terms understandable by anybody. The third, concluding part of the book is the most powerful. In the third volume Shaposhnikov examines the questions of mobilization.

The theory was simple, understandable, logical, and unquestionably correct. Stalin understood it, appraised its worth, and added it to the base of his own strategy. This is why reading Shaposhnikov's works (as well as those of his supporters and opponents) and understanding the course of their thought helps us understand Stalin's actions, which at first glance seem illogical and unexplainable. The theory of mobilization, condensed and explained in layman's terms, consists of the following.

1. To achieve victory in a war, not only efforts of the entire army but full efforts by the entire nation, the people, industry, transport, agriculture, etc., are necessary.
2. The nation cannot exist in a constant state of preparedness for war, just as a man cannot constantly hold a gun in each hand. If he is always holding two guns, he cannot do anything else. Similarly a nation cannot constantly expend all its resources on preparations for war. Constant concentration of forces and expenditure of social resources on war preparations ruin the nation. Therefore, during peacetime the army and the military industry must operate at a minimal level. However, the nation, its people, government apparatus, industry, transport, agriculture, communication channels, ideological apparatus, and so forth must be prepared for a maximally quick and full transition from a peacetime to a wartime regime.
3. Mobilization is the transition of the entire country from a peacetime to a wartime regime. Mobilization cannot be curbed or turned back. Metaphorically speaking, mobilization is similar to thrusting one's arm down, unlatching a holster, and aiming the gun at the enemy with one's finger already on the trigger.
4. Mobilization and war are inseparable. If you take out a gun and aim it at the enemy with your finger on the trigger, you have to shoot. As soon as you begin to mobilize, the enemy will mobilize as well. You take aim, and the enemy does the same, trying to be faster than you by at least a fraction of a second. If you are a tiny bit of a second late, he will kill you.
5. You cannot play games with mobilization: if you often brandish guns and aim them at your neighbors with your fingers on the trigger, the outcome will not be a good one for you.
6. Once the path of mobilization has been chosen, you have to follow it up to the end—start a war.
7. Mobilization cannot be partial. Mobilization is a process similar to pregnancy. A woman cannot be a little bit pregnant—the answer is always “yes” or “no.” The same is true for mobilization in a country: either the entire government apparatus, industry, transport, armed forces, population, and all the national resources are mobilized toward war, or not.

These ideas, in various orders and manners, are voiced by many different authors. B. M. Shaposhnikov differed from his predecessors only in that he expressed the ideas clearly, briefly, and concisely: “Mobilization is not only a symptom of war, it is war itself. An order by the government to declare mobilization constitutes a *de facto* declaration of war. . . . In modern

conditions, a mobilizing country must make a firm decision ahead of time to conduct war. . . . In a general mobilization, it is understood that there can be no more return to peacetime positions. . . . We maintain that only a general mobilization has value, the concentration of all resources and forces necessary for achieving victory.” The book ends with a decisive declaration: “Mobilization is war, and we cannot understand it in any other way.”

Stalin not only shared Shaposhnikov’s views, but he had the same beliefs. Stalin did not make any distinctions between the process of taking power in his country or in the neighboring ones. He knew how to take power in his own country, and he planned to do the same in the neighboring ones. Stalin did not keep his art a secret. On the contrary, he made it into a display for the masses. In his book *On the Foundations of Leninism*, Stalin proved that games are not permissible in the quest for power. We either take control or we do not. Once the task is attempted, it must be carried out to the end. This goes along with the teachings of Niccolo Machiavelli: either you deliver a lethal blow or you do not attack at all; no in-between decisions can exist in politics or in strategy. This also goes along with Shaposhnikov’s ideas: we can either not mobilize at all or we can conduct a full mobilization and enter the war—no partial, in-between positions can be adopted.

There was another problem: mobilization had to be concealed. Long before World War II, Stalin and Shaposhnikov worked out a way to conceal mobilization. For this reason, there was no universal military draft in the Soviet Union until 1939. The army was very selective and did not take in just anybody. This was to show what a peace-loving people we were. The age requirement for entering the armed services was twenty-one. This is strange. Why not draft at eighteen or nineteen, right out of school—let the boy serve his term and be free? By age twenty-one a man could have found a job and started a family, while his future remained uncertain: would they draft him or not? Nobody could really explain why the army had to take men at age twenty-one and not younger.

There was, however, a lot of thought put into this system. It was like a dam on a river: not everyone was let through (that is, drafted), only some, while the rest amassed on the other side. At the necessary moment a universal draft could be instituted (only the pretext had to be invented), and all those who did not earlier serve in the army could be called in. During the intervening years, there were many of them saved up.

The moment came—September 1, 1939. On this day, a universal military draft was instituted, and all those who had not served earlier began to be taken in. In every separate case the calling of a mature man to the army did not raise suspicion that a big war was looming: every man must serve his country, so this or that Ivan had to do now what his friends did before.

Stalin had another tactic in reserve: according to the new law, the draft age was reduced from twenty-one to nineteen, and in some categories to eighteen.⁸ My own father was among this group—he had just turned eighteen at the time.

The simultaneous draft of three age groups (never seen before), and the draft of all those who had not served earlier, placed a double burden on the shoulders of the nation. On the one hand, the economy was deprived of all these workers; on the other hand, they all had to be clothed, fed, equipped, and housed somewhere (try to find a place for at least one million new soldiers!). This was an explosive development of military might.

After 173,000 reservists were drafted in the second half of July 1939 to support the troops of the Trans-Baikal military district and the 1st Army Group in Mongolia, the Red

Army (without the navy interior troops or border guards) numbered 1,871,600 men. By June 22, 1941, the Red Army (again without the navy, interior troops, or border guards) numbered 5,081,000 men.⁹

The law adopted on September 1, 1939, allowed for an increase in the ranks of the Red Army from 1.5 million men in the spring of 1939 to 5.7 million in the spring of 1941 without declaring mobilization and alarming the neighbors.¹⁰ Additionally, this law allowed for the preparation of 18 million reservists, so that at any moment they could fill the ranks with the desired number of soldiers.

This army development had a time limit, because Stalin called several age groups into the Red Army at the same time—in essence, all the young men in the country. The duration of army service for the majority of the population—privates in ground forces and NKVD (Political Police) forces—was two years, so the country had to enter a major war before September 1, 1941. If not, all the young people would go home on September 1, 1941, and then there would be almost nobody left to draft. All these new armies—assault and mechanized corps, tanks, air force, and all other divisions—would have to be disbanded. It is impossible to maintain an armed force of this size without a war: it does not produce anything and it consumes everything produced by the country. The creation of such an army could only lead to war. The modern Russian ministry of defense acknowledges this. “No nation can maintain a mobilized army with any intent other than war: the economy cannot stand the strain, and the mobilized but unused army begins to decay.”¹¹ This was said about the mobilization conducted by Stalin starting on August 19, 1939.

When he made the decision to launch a secret mobilization, Stalin firmly knew that in two years, in the summer of 1941, the Soviet Union must enter into a large war. Without war, no terror could suffice to keep five million soldiers, who have already served their two required years, in their barracks. It would be impossible to retain them in the army after their terms in the army expired. To put it more simply, the decision to enter a large war was made in the Kremlin in August 1939 and the deadline for entering the war was set—the summer of 1941.

Mobilization of the Economy

A doctrine about war fought on enemy territory took hold during the prewar years, which was of a clearly aggressive nature.

—COLONEL S. VAUPSHASSOV, HERO OF THE SOVIET UNION

For many years, the People's Commissariat of Defense Industry was in charge of arms production in the USSR. On January 11, 1939, it was dismantled, and four new People's Commissariats were created instead: one for the shipbuilding industry, one for weapons, one for the aviation industry, and one for ammunition.

The Shipbuilding Commissariat was unofficially called the Submarines *Narkomat* (short for People's Commissariat). In theory, this commissariat produced both civilian and military ships. But in practice, the facts were such that "by 1935 all major shipyards were redesigned for production of military ships."¹ In 1939, Germany entered into World War II with fifty-seven submarines. We are assured that the Soviet Union had no intentions of entering into the war, but in September 1939 it possessed 165 submarines. The submarines matched up to the best world standards.² Some of the submarine designs were developed in Nazi Germany on Soviet orders by the company Deschimag AG Wesser. They say that Stalin trusted Hitler. They should look more carefully into who trusted whom.

In the Soviet Union, the most modern American technology and renowned American engineers were used in the process of submarine production. They say that Stalin was too trustful, but I think Roosevelt possessed more of that particular quality. Aside from American, German, British, Italian, and French accomplishments, the Soviet shipbuilding industry also made its own technological advances. We also had some talented engineers.

From the moment of its founding, the Shipbuilding Narkomat undertook strictly military projects. Moreover, many ships that had earlier been built for civilian needs were now armed and given over to the navy. With just one directive by the Soviet government, on May 25, 1940, the following numbers of civilian ships were handed over to the military: 74 to the Baltic fleet, 76 to the Black Sea fleet, 65 to the North fleet, and 101 to the Pacific fleet. At the

same time, the shipyards of the Narkomat all began to operate on two extended shifts, which practically meant a regime of wartime production. The result of this was that by June 22, 1941, the Soviet Union possessed 218 submarines in its ranks and 91 more in shipyards.

Surface warships were also being built, as well as bought from abroad. For example, right before the war a ship of amazing gracefulness of form and an unusual coloring appeared on the Black Sea. People who did not know what type of ship this beauty was nicknamed it the “blue cruiser.” In fact, the ship was a destroyer leader, not a cruiser. It was called the *Tashkent*. The *Soviet Military Encyclopedia* says of most noteworthy ships that they were “built at one of the domestic shipyards.” However, this is not said about the *Tashkent*; only the year it was accepted into the fleet is mentioned—1940. The usual words are absent because the pride and beauty of the Black Sea fleet, the leader *Tashkent*, was built in fascist Italy and sold to Stalin.³

The *Tashkent* was purchased without weapons. Mussolini would have sold Stalin the weapons as well, but at that time there was nothing in the world that came remotely close to the Soviet 130-mm ship cannon. Therefore, the *Tashkent* was armed with Soviet cannon in the shipyards of Nikolaev.

Italy was not the only country that sold warships to Stalin. On May 31, 1940, the unfinished German cruiser *Lutsow*, renamed the *Petropavlovsk*, arrived in Leningrad and was delivered to the shipyard of shipbuilding plant #189. A cruiser is a huge and complex structure, the building of which would have taken several years to complete, and there was not enough time to introduce changes into its design and to equip it with Soviet weapons. It was decided to build it completely according to German designs and equip it with German weapons, and Germany supplied the weapons.

All this seems unbelievable: May 1940, the heat of the German blitzkrieg in Western Europe, the British fleet blockading the German navy. Hitler had only two options left—either to fight against Britain, for which he needed a powerful fleet, or to seek peace with Britain, for which he also needed a powerful fleet: an enraged Britain would obviously not negotiate with a weak Germany, but instead would demand its immediate withdrawal from all occupied territories. Hitler lagged far behind Britain in the number of above-water ships, and in this critical time he was selling his unfinished, most modern ship to Stalin!

Stalin’s behavior is also surprising: he declared neutrality, but continued to build a gigantic fleet and, moreover, bought warships from countries already at war. The answer to this riddle is simple: in 1940 Germany was already suffering from a terrible deficit of raw materials because her naval routes were blockaded, so Hitler could only buy large enough quantities and assortments of materials from Stalin. In exchange for this, Hitler was forced to sell his technology and weaponry, including his newest planes, cannon, ships, communications devices, firearms, and so forth.

Stalin knew that the German economy was facing a crisis, and he could have chosen not to sell raw materials to Hitler. In that case, the war in Europe would have quickly died down. But Stalin wanted the war to gain strength, so that France, Britain, Germany, and all the other countries would expend themselves. Stalin planned to use their weakened position and establish his own regime in Europe. For this Stalin was building up his fleet, buying military technology from everywhere possible, and feeding Hitler the raw materials he needed.

Some might ask why Stalin’s two hundred submarines and the rest of his navy could not give the kind of resistance that was to be expected from the most powerful underwater fleet

in the world. The answer is simple—this was an attack fleet. It was an instrument created for aggressive warfare. It was very difficult, nearly impossible, to use it in defensive war. “During the course of the war the fleet had to solve problems that were completely unforeseen during its construction. Instead of coordinating their actions with the deep offensive operations of the ground forces, acting near the shores, as the military doctrine dictated, the fleet was forced to secure the naval bases under enemy attack from land and sea and to evacuate troops, population, and property from shoreline cities.”⁴

In March 1939, at the Seventeenth Congress of the Communist Party, the commander of the Pacific fleet, 2nd Rank Flagman N. G. Kuznetsov declared: “The fleet must transform itself, and it will, just like the entire Worker-Peasant Red Army, into the most powerful attack fleet.” Stalin rewarded him for such words by promoting him to People’s Commissar of the Navy. Kuznetsov kept his word—he did his best in order to prepare the Soviet fleet to launch surprise attacks. But entirely different ships with entirely different characteristics are needed for defense: submarine hunters, picket boats, minesweepers, and net-layers. According to Kuznetsov’s orders, all reserves of shells, mines, torpedoes, and ship fuel were transported to the German borders in Liepaja and to the Romanian borders in the river ports of the Danube. There, these reserves were quickly seized by the Germans. The port of Liepaja was located so close to the German border that the battles for the city had already begun on June 23, 1941.⁵ Nobody had prepared to defend Liepaja from a land attack. Aside from everything else, in Liepaja were concentrated (and lost) three quarters of the Baltic fleet’s fuel reserves.

Not only was the basing system of the Soviet navy geared toward aggressive warfare, and its personnel trained to attack, but the armament of the ships was designed exclusively for participation in a war of aggression. Soviet ships, while armed with powerful artillery, mine, and torpedo equipment, had quite weak anti-aircraft armament. The Soviet ships did not have powerful anti-aircraft defenses because Soviet generals had planned to begin the war with a crushing surprise air attack against the enemy’s air bases and the annihilation of his aviation. Contrary to the plans, the war turned out to be of a defensive character, and the Soviet armies and fleets were not the ones to carry out the first attacks. The enemy had air superiority, and the Soviet troops and ships had very weak anti-aircraft defenses. The Shipbuilding Narkomat had been building ships with maximal attacking power and minimal defenses, in order to make the Soviet navy the most aggressive in the world.

The Aviation Narkomat also theoretically produced both military and civilian airplanes. But while it is possible to remember a dozen models of magnificent fighters, bombers, and assault planes, all produced in the tens of thousands, it is not so easy to think of the name of a single civilian aircraft. There was one airplane that, at some level, could be classified as a civilian model, but it was purchased from America, not created in the Soviet Union. This was the S-47, the best transport plane in the world. It was built according to the license to serve both as a passenger and as a paratroop-transporting aircraft. It was used in both the military and for civilian purposes, but for the sake of convenience—right at the factories during production—it was painted a camouflage green, so that it would not have to be repainted later.

The third organization in this family—the Weapons Narkomat—does not need to be explained, while the Ammunition Narkomat was something truly original that deserves some commentary. It was original because even during the course of the war all the countries that we are used to thinking of as most aggressive did not have a separate ministry in charge of ammunition. For example, in Germany even after the beginning of World War II only

one minister was in charge of the production of weapons and ammunition, not two. The Soviet Union, in peacetime, had created a separate ministry to take care exclusively of the production of ammunition. Stalin's Ammunition Narkomat began to function immediately and fully.

Right from the start there was a problem to be solved: where to locate all the new factories that would be producing shells, gunpowder, cartridges, and so on. The issue of finding locations for the new ammunition industry entailed the issue of the character of the next war.

If Stalin had planned to carry out a sacred defensive war, if he planned to hold down his borders, the new ammunition factories should have been built behind the Volga River. There they would have been fully secure—the enemy tanks and airplanes could not reach so far inland. If Stalin was not sure of his strength, if, as we have been told, Stalin was afraid of Hitler and had reservations about the Red Army's ability to hold the borders, if there had been a belief that it might be forced to retreat—in that case the new factories should have been built not behind the Volga but even farther inland, in the Ural Mountains, where there are raw materials, a sufficient industry and energy base, and where the factories would have been completely secure. Let the enemy take huge territories, but our industrial base would remain whole—then Hitler would have a taste of what a wounded bear is like.

But neither the first nor the second option was even briefly discussed; there was no need for them. The Red Army had no plans to retreat, just as it had no plans of holding down the borders of its country. According to Stalin's plans, the Red Army had to advance forward into a war-devastated and weakened Europe. If the Red Army crossed the borders and advanced, the ammunition factories along with all the other ones (tank, artillery, etc.) would be left behind farther and farther in the rear. Let us imagine that the Red Army needs to be supplied with a small quantity of ammunition, for example 100,000 tons, or 200,000 tons. How could they be transported from the Urals to the western borders? A standard military train could carry nine hundred tons. Imagine how many trains would be needed, how many railroad cars, how many locomotives. Estimate how many workdays would be spent by all the railroad personnel, how much coal would be burned, how many train guards would be needed for how many days.

Aside from all this, it is important to remember that shells were not the only things that would have to be transported along the railroad lines. The railroads during war are crowded with troops, repair crews, hospitals, cisterns, and so on. In other words, if we prepare an attack, the transfer of hundreds of thousands of tons of ammunition and all other equipment has to be done in secret, and secrecy is best achieved by shortening the distance to be covered during the transfer. In an ideal situation, all factories would be located right at the borders. Then the trains would need to travel only a couple of hours, not days across the entire country. In that case, the demand for transportation decreases, and one train can be reused for several trips. This frees up the internal railroad lines for other military needs. So, it was decided to build the new ammunition factories closer to the borders, as close as the metal-forging bases permitted, and not behind the Volga or in the Urals. The locations chosen were Zaporozhie, Dnyepropetrovsk, Dnyeprodzerzhinsk, Kharkov, Krivoy Rog, and Leningrad.

The ammunition factories put out more and more production, while the voracious Ammunition Narkomat consumed the nation's metal resources, including copper, nickel, chromium, lead, tin, and mercury. The more nonferrous metals went to producing ammunition, the less there was left for all the other areas of industry. The question arose as to how long this could be expected to last.

There was another question: what to do with all the ammunition that was produced? All of us have had to solve math problems in school that began with something like: "Water pours from a pipe into a certain container, and simultaneously pours out through another pipe." Such problems can be found in mathematics textbooks from centuries ago as well, even in the famous math book written by Magnitsky that was used to teach children during the reign of Catherine the Second. Stalin and all the military leaders, politicians, and economists also were at some point schoolboys and solved problems that asked about the water running in through one pipe and out the other. In 1939 that was precisely the case that came about: the Red Army consumed a certain amount of ammunition for its military training, for the "wars of liberation," and for "international aid" to Mongolia and China. If the amounts of ammunition coming in and being spent were equal, there would be no problem. But if the supplies coming in were greater than the amount that was being used, then soon there would be no more room to hold all the supplies.

The holding capacity of the artillery storages was known, as was the amount of ammunition used by the army. Through a simple arithmetic calculation it would be easy to determine when there would be no more space to hold all that was produced. What could be done then? Should new storage facilities be created? That is not quite so simple. Imagine that you have been given the task to build storage facilities that are to hold one million tons of ammunition. If the humidity levels at the facility rise above the norm, the metals will be corroded and the gunpowder will become wet. What would comrade Stalin and his loyal disciple comrade Beria do to you in that case? And if the temperature rises slightly above the norm or if the air is slightly too dry The storages cannot be close together or close to cities and factories—they must be far away from everything that could be harmed by their explosion. To make it short, additional storage facilities are not a valid solution. No matter how many are built, they will become too full if more ammunition pours in than pours out—and more and more was pouring in every day.

Aside from the undertakings of the Ammunition Narkomat, 235 factories under the jurisdiction of other Narkomats were also used to produce various types of ammunition during peacetime.⁶ And on top of all this, aside from the Ammunition Narkomat (which itself was huge) the chief directorate for construction of gunpowder, shell, cartridge, and missile factories was created in January 1941. This monster united under its control twenty-three construction areas. Note that all this was geared not toward building storage facilities but toward building new factories. The new directorate put up new factories with astonishing speed and gave them over to the Ammunition Narkomat. They now had to think of how to put to use all that they produced. In April 1941, an order came from the chief artillery directorate of the Red Army to transport the output of the Ammunition Narkomat to the western state borders and lay it on the ground. Ask anyone who has fought on the front what this means.

In the border regions of the Soviet Union the Red Army lost an unthinkable amount of artillery shells that were laid out on the ground. An equally unthinkable amount of shells was lost in railroad trains. In Byelorussia alone 4,216 railroad cars full of artillery shells were left at the border stations.⁷ Why were shells kept in railroad cars? Where were they going to be taken? If defense was being prepared, the shells should have been issued to the troops. If retreat was prepared, there would have been no need to concentrate the shells in the border regions.

But this is not what is most important. The most important is the fact that at the very beginning of the war almost all industry capable of producing new ammunition was lost. "From August to November 1941, the German troops took 303 Soviet gunpowder, shell, and missile factories, which had a production capability of supplying 101 million artillery shells, 32 million mines, 24 million air bombs, [and] 3,600 tons of TNT. This constituted 85 percent of all output from the Ammunition Narkomat."⁸ In addition to all this, the mobilization reserves of the most valuable raw materials were concentrated in those factories, including lead, forged steel, and tin. All this went to Germany and was used against the Red Army. But Stalin's prewar potential was so great that he was able to rebuild his industries during the course of the war behind the Volga River and in the Urals, and produce all that later was used to defeat the German army.

When the Ammunition Narkomat was created, nobody was posing a threat to the Soviet Union. Japan had a powerful air force and navy, but its land army was relatively small, and it was engaged in a rather unpromising war in China. Japan had limited reserves of raw materials. Soviet intelligence reported to the government that Japan could possibly decide to wage a large war in order to seize raw material sources, but the Japanese were primarily interested in those regions where the mining and purification of the materials was already set up, because Japan needed those resources immediately. In other words, Japan would fight to control the southern territories, and it would not venture into Siberia, where resources were unlimited but where their mining and purification would take several years and huge expenditures.

The Soviet General Staff, the government, and Stalin himself were not very afraid of German aggression in early 1939. There was no common border with Germany back then, so Germany could not attack suddenly. The creation of the Ammunition Narkomat in January 1939 could not be a response to German war preparations. Soviet intelligence knew that at that moment German industry was operating on a peacetime regime. In June 1939 the chief of the GRU, Ivan Proskurov, reported to Stalin that Germany was unprepared for a large-scale war: if Germany invaded Poland, it would use up its air-bomb supplies within ten days. Germany had no reserves.

After the war, the book *Results of World War II* came out in Germany. Field Marshal K. Kesselring, Colonel General H. Guderian, Colonel General L. Rendulic, Lieutenant General E. Schneider, Admiral E. Godt, and others were among the authors of the book. When comparing the analysis made by Soviet intelligence and the actual events, we must acknowledge that Soviet military intelligence was mistaken. The German supply of bombs ran out not after ten days of war, but on the fourteenth day after the attack against Poland.

Apparently the best studies of the development of the German army during the reign of the Third Reich were done by Major General B. Muller-Gillebrand.⁹ The general said that in 1939 the German High Command of the land troops demanded that a reserve of ammunition be created that could last for four months of war. However, such reserves were never created. If a four-month supply is taken as 100 percent, then there was in actuality only 30 percent of pistol cartridge reserves, enough for 36 days of war; 15 percent of ammunition for mountain guns; 12 percent of mortar shells for light mortars, and 10 percent for heavy ones. The best supplies were for the heavy field howitzers—there were enough shells to last for two months of war. The worst case was with the tank shells. In September 1939 the main tank

of the German *Wehrmacht* was the Pz-II, equipped with 20-mm cannon. There was only 5 percent of the needed supply of shells required for four months of war, meaning only enough for six days of combat.¹⁰

Despite all this, Hitler was not eager to mobilize the country's industry toward war. The German army waged a war, which began as a European conflict and turned global, but German industry remained operating on a peacetime regime.

For fifty years the Soviet government has been persuading us that in 1939 war was unavoidable, the world was headed for war, and Stalin could do nothing but sign a non-aggression pact with Germany. An analysis of the conditions of German industry in general, and in the area of ammunition production in particular, allows us to assert that the situation was not at all so critical. The world was not headed for inevitable war, and a war could have been averted, if Stalin had wanted to avert it. And what is more, if in September 1939 the Red Army had intervened on the side of Poland, Stalin would not have lost anything, while Hitler could have suffered a devastating defeat simply because he did not have enough ammunition. But Stalin did not capitalize on the German weakness.

When the war began, the German situation regarding ammunition did not improve, but in May 1940 Hitler delivered a fatal blow to France. There were enough shells and missiles to carry out the attack, but if Stalin had attacked Germany in 1940, there would have been nothing left for Germany to use in fending off his attack, because her industries had still not been mobilized. After this followed the Battle of Britain, and once again the German air force was engaged in a war but German industry was not. Then Hitler invaded the Soviet Union. Here, he had tremendous luck—at the very border he was able to take huge quantities of Soviet supplies. Without these supplies he would not have been able to reach Moscow.

The seizure of Stalin's supplies was a tremendous achievement for Hitler, but he had to also think of shifting his own industry to a wartime regime. Hitler, however, was in no hurry to do this. The war in Russia was serious business, and the German army had to spend more shells than ever before. The production of ammunition did not in any way correspond to the expenditures required by the army. Major General B. Muller-Hillebrand cites entire pages of clear-cut statistics. Here are some figures randomly chosen from many thousands like them. In October 1941, the German army engaged in ferocious battles with the Red Army and used 561,000 75-mm shells, while the industry during that period produced only 75,000 of those shells. In December, 494,000 were used and 18,000 received from the factories.¹¹

This could not have lasted for very long. But Hitler was in no hurry.

In December 1941, Stalin carried out powerful attacks against the German army near Moscow. In December, Hitler declared war on the United States of America. It would seem to be the perfect time to shift industry from a peacetime to a wartime regime. But Hitler still waited. Only in January 1942 did he make the decision to gradually begin the shift of German industry to fulfill wartime needs. The difference between Stalin and Hitler was that Hitler first waged a war against the entire world, fought for over two years—and only then began to mobilize his industries. Stalin, on the other hand, acted in the exact opposite manner. Stalin tried with all his powers to delay the moment when the Soviet Union would have to enter into the war, but he began mobilizing the industries and setting them on a wartime regime back in January 1939.

During the course of World War II, the Red Army had the most powerful artillery in the world. The artillery was used correctly, meaning that it was secretly concentrated in

masses on narrow strips of territory and used in sudden, intense strikes. In the Stalingrad operation, the Don front under Lieutenant General K. K. Rokossovsky broke through defenses on a narrow strip of land—only twelve kilometers. Here, besides the tanks, twenty-four rifle regiments supported by thirty-six artillery regiments led the breakthrough. Rokossovsky concentrated 135 guns on every kilometer, and 167 weapons per kilometer in the primary locations. During the course of the war, the concentration of artillery, tanks, infantry, and aviation constantly increased. By the end of the war, the Soviet staffs began to use kilotons as units of measurement for calculating the power of artillery attacks. Soviet artillery began to speak the language of the atomic age.

In the Vistula-Oder operation, the Soviet command used 34,500 guns and mortars. They were not evenly distributed throughout the force, but rather concentrated on the strips where the breakthrough was to occur. In the strip covered by the 3rd Guards Army, the concentration reached 420 weapons per kilometer. During the course of the war, the duration of artillery softening-up constantly shrank, while artillery power grew. In the same operation, in the area covered by the 5th Shock Army, the duration of softening-up was planned to be reduced to 55 minutes.¹² It began well, but after 25 minutes it was ended. Twenty-three thousand tons of ammunition was used during the 25 minutes, and 15,200 shells of medium and large caliber were used on each kilometer of that front. Penal battalions marched through the breakthrough and did not meet any opposition. Their actions confirmed that additional softening-up was not necessary, nobody would offer any opposition. This saved thirty minutes of time (very significant in war) and thirty thousand tons of ammunition.

Even more artillery was used in the Berlin operation—over 42,000 guns and mortars. Along the breakthrough areas, huge quantities of ammunition were concentrated, as well as huge quantities of weapons. Marshal Ivan Konev broke through thirty-six kilometers of front line, and used 8,626 weapons to do it. Marshal Zhukov concentrated fewer arms—7,318 guns and mortars—but broke through thirty kilometers of front line, so he actually had higher concentrations of artillery. The main forces of the tank and air force armies were also gathered in these areas, as well as corresponding amounts of infantry.

The record was set in the area occupied by the 381st Rifle Division of the 2nd Shock Army, during the course of the East Prussian operation: 468 guns and mortars on one kilometer of front line, not counting the Katyusha salvo-fire installations. During the course of the war the Red Army used 427 million shells and artillery mines and 17 billion cartridges. Just divide this by the number of German soldiers and determine how many shells that makes per soldier. To this you can add the number of hand grenades, land mines, and air bombs. Who could resist such a mighty army?

Here we must also remember that in the war the Soviet Union used only 15 percent of the prewar potential of the Ammunition Narkomat; all the rest was lost during the early periods of the war. Hitler's surprise attack not only annihilated tens of divisions of the Red Army and destroyed the strategic reserves; he also occupied the territories where the newest ammunition factories were located. The Red Army destroyed its own factories or simply abandoned them as it retreated. Some machines were evacuated, but try to move at least one furnace for thousands of kilometers. . . . Try to transport even one thousand tons of ammunition from the border forests to the railroad stations, load them into trains, and evacuate them under enemy fire.

Hitler delivered a surprise blow to Stalin. Stalin lost almost all his ammunition factories. He had to fight back using only 15 percent of the might of the Ammunition Narkomat.¹³ The results of the war are well known. Try to imagine what could have happened if Hitler had stalled with his attack and would have, instead, himself been attacked by Stalin. In that case, Stalin would have been using not 15 percent of his ammunition, but the full 100 percent. What would the outcome of World War II have been then?

The Winter War: Finland

The Red Army will consider its Bolshevik mission complete when it achieves control of the entire globe.

—JAN GAMARNIK, CHIEF OF THE POLITICAL DIRECTORATE OF THE RED ARMY, IN A SPEECH
GIVEN AT A MEETING OF THE NATIONAL COMMITTEE
FOR DEFENSE OF THE USSR ON MARCH 15, 1937

In October of 1939, immediately after the division of Poland between Germany and the Soviet Union, Stalin's diplomats addressed the government of Finland, demanding the cession of the Karelian Isthmus.¹ In exchange, they offered the Finns a piece of territory twice the size of the isthmus. Upon first glance, the proposition seems alluring—Finland sacrifices 2,761 square kilometers, and receives 5,528 square kilometers in return. However, the proposition was not alluring, but rather contemptuous. The Karelian Isthmus is a direct gateway to the capital of Finland, the largest ports and most populated regions. The geographical disposition of Finland is such that any aggression could come only from the Soviet Union, and only through the Karelian Isthmus. Precisely for this reason, the Finnish army, starting in 1918 (after winning its independence fighting against Russian and local Bolshevik troops during the Russian civil war), began an extensive buildup of defenses on the Karelian Isthmus. Starting in 1929, the scope of the buildup expanded significantly. On the Karelian Isthmus emerged a solid strip of fortifications and obstructions, which became known as the Mannerheim Line, named for the country's commander-in-chief, who had won the war of independence in 1918. Finland spent practically all of her military budget for the ten years preceding the war on the creation of this line of fortifications. Military experts from all countries of the world unanimously agreed that no army, taking any amount of time, could break through the Mannerheim Line. Nevertheless, Stalin's envoys demanded from Finland the cession of her main and only defense structure, meaning they wanted the Finns to put down their arms and hand over to the Red Army, without a fight, the road to their country's unprotected internal regions—well developed and heavily populated. In exchange, they were

offering a huge piece of swampland and marshy woods, in which no one lived and which no one needed.

The “exchange” of territories was the first step in the plan. Stalin had prepared a second step as well—a revolution in Finland and takeover by the Communists. Already in October 1939 the 106th Rifle Division of the Red Army was supplemented with Finnish Communists who lived in the Soviet Union.² When necessary, this division could be declared the “national army of Finland” and used as a weapon against the legal government. Stalin had prepared a new Communist “government” as well, which was strengthened with officers from the NKVD and the military intelligence. This “government” could at any moment, in accordance with “the will of the Finnish people,” be sent to Helsinki. Stalin had started the formation of this “government” already in June 1939. He decided to appoint Division Commander A. Anttila of the Red Army to the position of “minister of defense.” Down the road, the same man became a major general in the Soviet army. In the plans, the future “minister of the interior” of Finland was an operator of the NKVD, T. Lekhen. At the head of the “government,” Stalin had put the Soviet intelligence officer Otto Kuusinen. Conveniently, Kuusinen was also appointed as “minister of foreign affairs.”

Kuusinen had already once been the member of a Communist government in Finland. In 1918, he had created the Communist party of Finland using Soviet money, and had tried to stage a coup. After his plans for a government turnover failed, he spent over a year in the country underground and conducted intensive terrorist activity against Finland in the interests of the World Revolution. After his cover was blown, he fled to the Soviet Union. In 1921 Kuusinen entered the ranks of the highest officials of the Comintern and became one of the leaders of the World Revolution. In 1937 Stalin mercilessly cleansed the Comintern, and a large majority of the leaders were executed. Kuusinen, for some particularly useful service, escaped execution and in 1941 he became a member of the Central Committee of the Communist Party of the Soviet Union (CPSU). In 1952 he became a member of the Presidium of the Central Committee of the CPSU, meaning he entered the most elite group of leaders of the Soviet Union.

Kuusinen’s wife, Aino, was an intelligence agent for the General Staff of the Red Army. From 1931 to 1933 she was in the United States illegally, and from 1934 was in Japan working with Richard Sorge. In 1938 Stalin ordered her to return to the Soviet Union and threw her in jail.³ And so, this Communist Otto Kuusinen made preparations for delivering freedom and happiness to the Finns, while his own wife roted in Stalin’s jail, and Stalin could at any moment either raise him to the highest leadership position in the USSR or place him before a firing squad.

Three months before the start of the war in Finland, in August of 1939, the Red Army in a surprise attack obliterated the Japanese Sixth Army in Mongolia. Logic would lead us to the conclusion that if the Red Army had the capacity to destroy an entire Japanese field army, Finland could not possibly present any difficulties. Stalin knew the strength of the Red Army, and was certain that Finland would accede without a fight to all his demands. For this reason he did not conduct any serious preparations for war. However, the people and the government of Finland turned out to be unwilling to bend to Stalin’s requests.

Stalin issued an order to crush Finland. For an attack, the Soviets needed a pretext. As if on demand, on November 26, 1939, seven artillery shells allegedly flew in from the Finnish

side and exploded on the Soviet side, killing three privates and one junior officer.⁴ Finland's government declared that no shell could have come from Finnish territory, because Finland had no artillery near the border. Finland furthermore declared immediate willingness to invite experts from neutral countries or to create a joint committee of Finnish and Soviet experts for further investigation of the incident. But Stalin did not need any investigation. Since Finland "attacked" the Soviet Union, the Red Army must "strike in retaliation."

On November 30, 1939, after a brief but intense artillery softening-up, the Red Army crossed the Finnish border, having as its objective taking Helsinki by December 21, 1939—Stalin's sixtieth birthday. The main strike was carried out on the Karelian Isthmus; secondary strikes were carried out along the entire Finnish-Soviet border, from the Baltic Sea to the Barents Sea. Radio Moscow declared that the Finnish people rose up against capitalists and the Red Army was heading forward to assist the uprising. Units of the Red Army occupied the small village of Terioki. Immediately, Kuusinen's "government" arrived from Moscow to this village and went to work. All the "ministers" of the new Communist Finland for some reason spoke Russian. Kuusinen's son kept the records and protocols, also in Russian. The "government" established diplomatic ties with the USSR on December 1, and on December 2 it signed an "agreement on mutual help and friendship between the Soviet Union and the Finnish Democratic Republic." The agreement was signed by comrades Molotov and Kuusinen and printed in two copies, but in only one language—Russian. Comrade Kuusinen also signed in Russian, using the Cyrillic alphabet.

However, a victory march on Helsinki did not happen. The Mannerheim Line was not located on the immediate border, but deeper in the territory behind the "security pale." This pale was a strip of land that started at the border and stretched from twenty-five to sixty-five kilometers deep into Finnish territory.⁵ The security pale was a strip of land full of traps, barricades, obstacles, and minefields. The entire space was filled with granite boulders and concrete blocks, forest blockages, scarps and counterscarps, and anti-tank trenches. In this strip for many years, on purpose, there had been no industrial or transportation buildup. Finland did not keep any large military formations or any large amounts of supplies here. All existing bridges on this strip were wired with explosives and ready to be blown up or burned, along with everything else in sight, by the Finnish border patrol in the event of retreat.

The security pale is a kind of shield used by the defending side against the aggressor. When trapped in this line, the aggressor loses speed of movement, and his troops sustain casualties even before encountering the main forces of the enemy. In this territory the defending side employs only small but very mobile units. The units burst out from under cover, carry out sudden attacks, and quickly retreat to new positions, which were prepared beforehand. These light squads try to pass themselves off as the main forces of their army. The aggressor is forced to stop, turn his troops, and spend shells on empty spaces, while these light squads of the enemy have already quickly and covertly retreated and are preparing ambushes in new positions.

Upon finding himself in the security line, the aggressor loses his most significant advantage—surprise. While the aggressor carries out an exhausting struggle against the light defense squads, the main forces of the defending side have time to achieve full readiness and meet the aggressor in convenient positions. Finland's army acted exactly in this manner. The deeper the security pale stretches, the better for the defense. There can never be too much of a good thing. While breaking through a deep security pale, the aggressor involuntarily shows

the main thrust and direction of his movements. Losing the element of surprise, the aggressor himself becomes its victim—the depth of the security pale is unknown to him, so the encounter with the main forces of the defenders occurs at a moment previously unknown to the aggressor, but well planned by the defense.

On the Karelian Isthmus and on other sections of the security pale, Finnish snipers and light mobile squads were fully active and operating to the best of their capacity. Here is a standard situation: a column of Soviet tanks, motorized infantry, and artillery is moving along a forest road. To their left and to their right there is nowhere to go—impassable woods, packed with land mines. Ahead of them is a bridge. The Soviet demolition experts check for mines and come back reporting that the way is clear. The first tanks begin to crawl onto the bridge—and together with the bridge they fly up into the air: packs of dynamite had been inserted into the supporting beams of the bridge during its construction; they are undetectable, and even if they had been discovered, any attempt to diffuse them would have triggered an explosion. Thus, the Soviet column, many kilometers in length, like a giant snake, is stopped in its path. Now, the Finnish snipers spring into action. They take their time. Bang, bang, bang, and once again the forest is silent. And again, bang, bang. The snipers strike from somewhere far away. They hit only Red Army officers and tow-truck drivers. A diversion through the forest is not an option—keep in mind that on both sides of the road lie impenetrable minefields. Any attempt by the Soviet demolition experts to approach the destroyed bridge or to defuse the mines is met by a prompt and accurate response by the Finnish snipers.

The 44th Rifle Division of the Soviet Red Army, which had been advancing four hundred kilometers north of the Karelian Isthmus, was locked in place on three parallel roads which led to three blown-up bridges. In one day of fighting, the division lost practically its entire commanding staff. The same was true in other divisions—the columns became immobile, and could not take a step back or a step forward. At night, the columns suffered brief surprise attacks from somewhere far away in the woods. At night, the Finns fired out a couple of rounds of shells at a time from their concealed positions in the bushes, hitting the defenseless ranks. Then again all became quiet, until the next round.

It is said that the Red Army did not show its best side in Finland. This is true. But let us imagine in place of the Soviets a division from any other army. What can they do in such a situation? Pull back their columns? Heavy artillery and tractors with huge howitzers in tow cannot pull back. Finnish snipers hit tractor drivers, one by one. With tremendous difficulty, inch by inch, the column manages to crawl backwards; meanwhile, behind them another bridge explodes. The column is locked in. All the paths that lead to that other bridge are also blocked by mines, and the snipers there are also taking their time and hitting, one by one, commanders, sappers who try to disarm land mines, and drivers. Far ahead is the practically impenetrable line of concrete fortifications—the Mannerheim Line. To break through this line without artillery and thousands of tons of ammunition is impossible. . . . Soviet troops reached the Finnish fortifications, but their heavy artillery was far behind, bogged down between minefields and blown-up bridges, and under fire. In total, during their retreat on the Karelian Isthmus the subdivisions of the Finnish army destroyed 143 bridges and viaducts.

As a result of these actions, it took the Red Army two weeks to pass through the security pale. After this, the divisions of the Red Army reached the main line of defense, having already suffered heavy losses, with a broken morale and without ammunition, fuel, or supplies.

Their maneuvering capability was strictly limited: any step off the main path could become the last step. The rear had lagged behind and was constantly under threat of repeated attack by the light squads of Finnish soldiers, who had flawlessly memorized the area and knew secret safe passages through all the minefields.

Having overcome the security pale, the Red Army found itself halted by the fortifications of the Mannerheim Line. The line was in fact a brilliantly camouflaged defense structure, well integrated into the surroundings, and stretching 135 km in width and up to 30 km in depth. Its right flank met the shore of the Baltic Sea; its left flank bordered Lake Ladoga. All in all, the Mannerheim Line counted 2,311 concrete, ironclad, and wooden defense structures. The fighting on the Mannerheim Line was especially tenacious. The Red Army succeeded in breaking through the Mannerheim Line only on March 12, 1940, in the process sustaining colossal casualties, in both men and arms: 126,875 soldiers and officers were either killed in action, or disappeared without a trace, or died from wounds and disease. Additionally, the army counted 188,671 wounded, 58,370 ill, and 17,867 frostbitten.⁶

On March 13, 1940, the war between Finland and the Soviet Union was ended. The war lasted 105 days and became known as the Winter War. The Soviet Union received the Karelian Isthmus, but Finland kept her independence.

The whole world was shocked by the unbelievable weakness of the Red Army. The giant Soviet Union could not take care of Finland, whose population was only slightly more than 3.5 million. All around the world, newspapers were filled with caricatures and reports of the Soviet Union's utter lack of readiness for any war, no matter how small.

A conviction arose among military men, writers, historians, and politicians that the Red Army had demonstrated in Finland complete and utter lack of capacity to wage war. For many decades this idea has been taught in military academies, schools, and universities. However, the actions of the Red Army during the Winter War do not demonstrate weakness. They exhibit tremendous strength. First of all, it is necessary to keep in mind that the Red Army acted in conditions that no army had previously faced. It was conducting an attack in an average temperature of 21 to 24 degrees Celsius below zero. Sometimes it was warmer, but frequently it was colder. On the very first night of the war, the temperature was registered at minus 39 degrees Celsius. Some nights had been even colder. Action was taking place not only on the Karelian Isthmus, but also a thousand kilometers to the north, up to the Arctic Circle and even farther. The cold there was even more severe. Not a single army in the world had conducted an offensive operation, even a failed one, under a temperature of minus 20 degrees Celsius. In such temperatures, no one had even attempted to conduct massive attacks, because it is impossible. Nevertheless, the Red Army conducted successful offensive operations in temperatures of minus 30 degrees Celsius and colder. Stalin ordered the army to act in impossible conditions, and the Red Army did the impossible.

How did the Finns defend themselves in those conditions?

Defense is a whole different story. For twenty years, practically Finland's entire military budget went to funding the creation of fortifications on the Karelian Isthmus. Beyond the infinite minefields, the anti-tank trenches and granite obstacles, the concrete tetrahedrons, and the wire obstacles that stretched in rows of ten, twenty, and thirty, there was a place marked on the map as "hill 65.5," protected by forty-seven rows of thick barbwire on metal stakes, connected to mines. In the last rows of barbwire, instead of stakes railroad tracks had been driven into the ground. Behind these rows of barricades were concrete casemates. Each

major defensive construction stored ammunition and fuel, contained warm sleeping quarters, a restroom, a kitchen, a dining room, and had running water and electricity. Communication lines, command posts, hospitals—all were below ground, under concrete, in the woods, hidden in the snow, all in warmth. The snipers who spent days waiting for their victims, and the soldiers of the light ski squads which raided the rear of the Red Army, were warmly clad and well equipped. Finnish soldiers are born, raised, and trained to act in these conditions. They know that, after several days of active patrol or ski raids, they will return to their comfortable bunkers, where a bowl of hot soup waits for them and where they can rest before their next assignment. They know that in the event that they are wounded, an operating table well below the ground awaits them, along with a clean, dry, and warm hospital bed.

But try attacking under these conditions. Try to amputate a leg when beyond the thin cloth wall of the hospital tent the temperature is minus 40, and inside it is minus 30.

In addition to the cold, there was the snow. The depth of the snow cover was up to 1.5 meters. Even if the temperature had been warmer, but the snow cover the same, conducting offensive operations would still have been impossible. Under the snow were the swamps. Deep snow acts as insulation, so the swamps do not freeze. Furthermore, chemical reactions take place in the swamps and radiate heat. As a result, even in the most severe cold, people, cars, and tanks fall under the snow and drown in the marshes. But even this is not all. There are not only swamps, but also lakes. Many of them also do not freeze, and for the same reason: where there is no snow, the water freezes to the bottom, but where there is a thick snow cover, the ice is very thin, and can perhaps support a person, but not a tank. Finland is a land of a thousand lakes, but how can you tell what is a lake and what is a field? Everything around was white, fluffy, sparkling. “The theater of operations consisted of 50 percent woodlands, 25 percent water, some swampland, and only about 10 percent of the total surface could be crossed by tanks.”⁷

On top of everything, under the snow were granite boulders. To the eye, the fields looked even under the snow. But as soon as the tanks tried to cross them, they ripped their tracks and broke their rollers. This happened even before they reached the minefields. The whole environment in Finland is one big anti-tank measure. Tanks cannot do anything here. Everywhere is either a field full of boulders, or a lake, or an impassible thicket of a forest. And all this is laced with millions of mines. A mistake can be made, but only once.

During the 105 days of the war, there were twenty-five days of flying weather. The rest of the time, blizzards or snowfall impeded flight. In December, there are very few daylight hours. Complete darkness falls at four o'clock. And farther north the day is even shorter, if there is any daytime at all. Any place where trees can grow, there is impenetrable forest. Tanks cannot do anything in the woods; artillery fire cannot be aimed in such thicket. There is no visible horizon. The observer cannot see where his shells go—he can hear them fly above his head, but he cannot see where they land. From the battery he hears yells: Too close? Too far? Who can tell? The only view of where the shells land is from the very field these shells land on. On the other hand, the Finnish artillery had always fought in these regions. Every battery had during years of peace drilled in these areas, and the aimers, observers, and commanders knew by heart the data for precision shelling.

And so, the Soviet artillery was pretty useless, the tanks were useless, for this environment is not for tanks. The air force also could not help, for it could not see anything. A tactics manual teaches: “From above, the forest resembles an even surface, and to locate troops in a

forest is a rare occurrence.” Under normal conditions, it is difficult to pick out enemy troops in a thick forest. But here, there was nothing to pick out—the Finns were under the snow, underground. In the daylight, the smoke from their stoves could be observed only where they wanted it to be seen, in decoy locations. But where is this daylight anyway?

The advancing armies could not go underground, because in December in Finland the frozen ground is little different from granite. And the wounded did not need to be dragged to the hospital, because in such extreme cold the wounded froze to death even with relatively light blood loss. In 1944 the German Colonel General L. Rendulic fought in the same regions:

In this forested and rocky zone the trees grow on disorderly piles of rock, which often reach as high as the average person, and even higher. During the first reconnaissance ventures, I sometimes attempted to stray from the path and penetrate the forest, but was rarely successful. Most often this was possible only in a crawling fashion, on all fours. . . . Movement through the rocks and between them is an extremely exhausting occupation. Only on rare occasions was it possible to go around the rocks. Any movement by car, even after the forest had been cleared, was out of the question. Even pack animals cannot pass through. . . . Movement of troops and conduction of warfare in formations, applied in the usual settings, are completely inappropriate here. The region of marshlands and swampy forests is equally covered with trees. Movement through those areas is even more difficult than through the rocky-forested area.⁸

This impenetrable region was further fortified by obstacles, and anti-infantry and anti-tank devices. Manmade obstacles were worked into the natural surroundings with great skill. Streams and small rivers crisscrossed the region and had high cliffs for shores. The shores were scarped. All bridges were blown up. All paths leading to the bridges were mined and under constant fire by the snipers. Behind all this was the main defense line, seven to twelve kilometers in depth.

But we know all this only now. Back then, the Soviet command knew none of this. Behind the main line they once again found fortifications and another security pale, and again minefields, barricades, and another fortified line.

The walls of the defense structures were concrete, one and a half to two meters thick. The above-ground walls were covered by armored plates, and all this was buried under multi-ton granite boulders and covered with soil. All was camouflaged and hidden. Above these casemates rose tall, thick pine forests, which in turn were covered with snow. Machine gunners, riflemen, and artillerymen were sitting behind the steel and concrete fortifications. Deep embrasures dimmed the flashes of fire and dulled the bangs. The Finns fired at point-blank range, while the advancing troops thought they were under long-range fire.

The Finns used cement of the brand “600” in the construction of their fortifications. For every cubic meter of concrete, they used 95 kilograms of steel armature. Here are the results: Soviet 280-mm mortar guns and 203-mm howitzers fired directly on the Finnish strongpoint named “pillbox #0031.” They used specially designed ammunition for firing on concrete. A 203-mm shell for the B-4 howitzer weighs 100 kg.⁹ The 280-mm shell for the B-5 mortar weighs 246 kg. There were 1,043 of the 203-mm shells and 116 of the 280-mm ones fired at the pillbox #0031. Only after this did the pillbox cease to resist attack. One hundred and thirty-two tons of shells for one pillbox!

Let us imagine preparations for the shelling of this pillbox. First of all, it must be located—this costs many human lives. Then one has to approach the pillbox through mine-fields and other obstacles. This also costs many human lives. Then, under constant fire from the pillbox, one must calculate and prepare positions for one's arms, and then secure them in these positions. The 203-mm howitzer weighs 17.7 tons in battle-ready position, and 19 tons in travel-ready position. The 280-mm mortar gun weighs 18.4 tons and 19.7 tons, respectively. They must be taken apart and towed by tractors on the small country roads and roadless terrain, since the pillbox is never located on a major road. During the transportation, the assembly process, and the positioning, these giants are extremely vulnerable. Then it is necessary to bring in the shells. The net weight of the ammunition used to shell one pillbox #0031 was 132,836 kilograms. But the shells are stored in secure wooden crates, which create additional weight. Boxes weighing 200 to 300 kg must be loaded onto trucks and brought to the firing positions on narrow dirt roads. Here, they must be unloaded. And this is only the shells. There are also the charges. Several tens of kilograms of gunpowder are needed in order to push a shell of such mass from the barrel. In a weapon of such caliber the charges are separate, and instead of cartridges one must use powder bags—silk sacks full of gunpowder that catch flame when used. Several tens of tons of gunpowder in silk bags constitute a very capricious and extremely dangerous cargo. Transportation and storage of this cargo is a very delicate, labor-intensive, and risky occupation.

If during the shelling of the pillbox #0031 the 203-mm howitzer fired one shot every two minutes,¹⁰ then for 1,043 shots they needed 2,086 minutes, or almost thirty-five hours. But firing constantly without breaks is impossible. One can only shoot during daylight, or it is impossible to correctly direct the fire. But perhaps the pillbox #0031 was under fire from an entire battery, not just a lonely howitzer? These weapons are so huge and cumbersome that one battery only has two of them. One battalion has three batteries—six howitzers. If the shelling comes indeed from a battery or from an entire artillery battalion the time needed to take down the pillbox diminishes. But then other difficulties appear: it is one thing to set up one howitzer in a good firing position, a whole different story if one needs to set up two, or six. Plus, the 280-mm mortar guns are nearby and firing away. It becomes very simple for the enemy to detect the firing positions of these giant weapons. These monsters, when in firing position, are extremely vulnerable to all fire.

Furthermore, the barrel of the 203-mm howitzer weighs five tons. At the moment it fires, a giant shell instantly accelerates to a speed of 607 meters per second. The barrel undergoes tremendous heat and dynamic stress. It can quickly overheat, to the point that all firing needs to be stopped. Additionally, the barrel wears out quickly and often needs to be replaced. All this is involved in shelling just one pill-box #0031.

The shelling of Finnish pillboxes was not always as successful as the case described here. Against the pillbox #0011, the Soviets unleashed 1,322 shells from 203-mm howitzers and 280-mm mortars—almost two hundred tons. The pillbox was partially damaged, but even after this it continued to resist. Sometimes, at the cost of much blood, Soviet combat engineers crawling under crossfire made their way to the Finnish pillboxes and attempted to blow them up. They discovered that a charge carrying 5,500 kg of explosives was not sufficient for blowing up a pillbox.¹¹

From April 14 to April 17, 1940, in Stalin's presence, the Kremlin assembled a council of the supreme command staff to discuss the events of the Winter War and share opinions. It

was decided that the 203-mm howitzer did not have enough power to destroy such constructions as the pillboxes. To solve this kind of problem a 305-mm howitzer was needed.¹² For the record: the 1939 model of the Soviet 305-mm howitzer B-18 weighed 45.7 tons, and a shell for it weighed 330 kg. The initial speed of the shell was 530 m/s. The maximum distance the shells could be fired was 16.6 km. Only such “monster-weapons” were suited for the destruction of the Finnish defenses.

The military experts of the West should have recognized the amazing warfare capabilities of the Red Army and the fallacy of their assumptions. From the actions in Finland, there could be only one logical conclusion: nothing is impossible for the Red Army. If it was capable of advancing in such conditions, then it was capable of advancing in any other conditions—there could be no worse conditions than those in Finland in the winter. If the Red Army had broken through the Mannerheim Line, then it was ready to crush Europe and whoever got in the way. In Finland the Red Army proved that it could accomplish any task, even an “impossible” one. The victorious Red Army accomplished what the strategists of the West had deemed unfeasible. But the strategists did not accept the fallacy of their predictions. Instead they declared the Red Army to be unfit and unprepared for war.

However, all who had followed the developments of the Winter War did not pay attention to certain inconsistencies. The first strange thing happened on March 12, 1940, after the Red Army broke through the Mannerheim Line. After this, a completely defenseless Finland spread out before it. Finland could now be taken by bare hands, like a turtle whose shell has been ruptured. But the Red Army, having broken through the impenetrable defense system of the Finns, stopped its advance. Why? In December 1939, already having premonitions of the strength of the Mannerheim Line, the Red Army should have stopped its advance and not gone to storm it. But if the Red Army did storm the line and, at the cost of unimaginable casualties, managed to break through it, it should have used what it gained. Stalin broke into the safe, but then did not take anything from it. Where was Stalin’s logic?

The second inconsistency: all leading military experts before the Winter War declared that breaking through the Mannerheim Line could not be done by any army. The Red Army did the impossible. Furthermore, it broke through the line impromptu, for it had not prepared for such limiting conditions. The Red Army broke through the line in only three months, when all the military experts of the West had maintained that it could not be done in any time frame. And now, all of a sudden these same experts began talking of the Red Army being completely unfit for war.

The third inconsistency: the first and loudest reports of the Red Army’s poor performance in Finland came in newspapers funded by Stalin. Stalin’s court poet, Alexander Tvardovsky, suddenly began speaking of the “infamous war.” For some reason he was not executed. For some reason, he was awarded Stalin’s praises. Stalin was wise enough to end his “liberation crusade” after the Mannerheim Line was broken and Finland was deprived of her security barrier.

Military operations in Finland were ended on March 13, 1940, and only three months later the three Baltic states, Estonia, Lithuania, and Latvia, surrendered to Stalin without a fight and became republics of the Soviet Union. The governments and military leadership of these countries had carefully watched the war in Finland and drew from their observations a frightening, but correct conclusion: the Red Army was capable of carrying out impossible orders, and it would not be stopped by any number of casualties. If Stalin commanded the

Red Army to annihilate somebody, it would sustain whatever losses it took to accomplish the order. Therefore, the three states surrendered without firing a single shot. They understood that resistance was futile. Meanwhile, Stalin issued an ultimatum to the leadership of Romania: give up Bessarabia. Remembering the experience of Finland, the Romanian government did not even organize lengthy talks: it handed over Bessarabia, and on top of it Northern Bukovina.

The Red Army conducted in Finland a unique and unparalleled operation. The Red Army performed in a fashion unrivaled and unrepeatable by any army in history, but for some reason Hitler concluded that it had performed poorly. German generals were watching wonders unfold before their eyes, but did not understand the significance of what they were seeing. German generals were unable to appreciate what they observed. Thus, the people surrounding and counseling Hitler made strange deductions concerning Stalin's readiness for war. Goebbels's diary from those days is full of remarks of this sort: "November 11, 1939: The Russian army presents no value. The army is poorly commanded, and it is even more poorly armed. . . . December 4, 1939: The Russian Army is of little value. . . . January 23, 1940: The military strength of Moscow is almost insignificant."¹³ Goebbels wrote down not only his own opinion, but also Hitler's: "He once again notes the catastrophic state of the Russian army. It can hardly be used for military action."¹⁴

For the Red Army, the war in Finland was a vaccine against hubris, boastful dispositions, and underestimating the enemy. The war in Finland taught the Red Army a lot: in 1941 near Moscow and in 1942 near Stalingrad, German troops met the Red Army, which by then knew how to fight in the winter. The German army, however, was not at all taught by the war in Finland. This war played a dirty trick on Hitler. He did not understand this war, did not correctly assess its hardships, and therefore made disastrous miscalculations. He suddenly decided that the Red Army was not ready for war and was unfit for any kind of action. Hitler turned out to be wrong. No conclusion about the strength of the Soviets follows out of the fact that the Red Army did not reach Helsinki. On the contrary, it follows that the Red Army was capable of reaching Berlin.

Many German generals realized that the Red Army, according to the results of the fighting in Finland, was assessed incorrectly. During the Battle of Stalingrad, Goering had publicly declared that the war the Soviet Union had launched against Finland was "perhaps one of the biggest cover-ups in world history." Goering believed that Stalin deliberately "sent to Finland a few divisions, equipped with obsolete weaponry, in order to hide the creation by the Soviet Union of an unprecedented war machine."¹⁵ In closed circles, Hitler himself admitted the mistake. This occurred on April 12, 1942. Hitler said the following: "The entire war with Finland in 1940, just as the Russian advance into Poland with obsolete tanks and weapons and poorly clothed soldiers, was nothing other than a grandiose disinformation campaign, because Russia at that time controlled arms which made it, in comparison with Germany and Japan, a world power." He also said, on June 22, 1942: "Back home in Russia, they created an extremely powerful military industry . . . and the more we find out what goes on in Russia, the more we rejoice that we delivered the decisive blow in time. The Red Army's weaponry is the best proof that they succeeded in reaching extremely high achievements."¹⁶

23

Germany's Strategic Resources and Stalin's Plans

The Fuehrer noted that the objective of gaining control of the Finnish Gulf is paramount, because free navigation in the Baltic Sea and direct delivery of ore from Lulea becomes possible immediately after the liquidation of the Russian fleet. Taking over Russian ports from the mainland will require three to four weeks. Only then can the enemy's submarines be paralyzed. Four weeks of fighting means 2 million tons of iron ore.

—COLONEL GENERAL F. HALDER, *WAR DIARY*

War is gluttonous, that is why every strategist constructs maps of supply routes that enable key raw materials to reach his country and the country of his opponent. His goals are to defend his supply lines and cut those of the opponent. If one draws a map of supply sources and supply routes, it becomes clear that Germany's position in 1939 was particularly difficult. After 1939 the position did not improve; it actually worsened. On the grand scale, Germany has no raw materials. Germany is tied by thousands of fragile strings to the rest of the world. Taking over Czechoslovakia, Poland, Denmark, Norway, Belgium, Holland, Luxembourg, France, Yugoslavia, and Greece, and conducting the *Anschluss* of Austria and Germany did not solve Germany's supply problem. Gaining control over millions of people and huge territories that did not contain raw materials only led Germany to spread herself thin, and did not bring any advantages.

Here is another aspect of the problem: Germany, France, Belgium—all have powerful steel-casting industries, but they do not have much iron ore. Too many things on the front and in the rear, from the soles of soldiers' boots to battleships, are made of steel. Due to steel shortages, German leaders—as high-ranking as Goering—seriously considered the possibility of building locomotives of concrete instead of steel.¹ Due to steel shortages, damaged bridges were repaired using wooden logs instead of steel beams. Due to steel shortages, railroad rails from spare tracks were used to repair the damaged sectors of primary tracks. Railroad tracks with two-way traffic were transformed into one-track roads. This slowed the entire rhythm of production in Germany and in the countries Germany occupied.

In any case, Hitler could not have counted on a quick victory—he had too many enemies. A long war was a path to suicide for Hitler, in the most literal sense of the word. In order to maintain for just a few years what he wanted to establish, he needed to gain iron ore supply. The richest ore mines in Europe, with high iron readings of up to 60 to 65 percent, were located in the area of Kiruna-Ellivare in the very north of Sweden, and arrived at German ports through the Baltic Sea.²

One of the weakest links of the German economy was the loading of iron ore in the Swedish port of Lulea, followed by the long trip along Finland's coast through the Gulf of Bothnia, past the Åland Islands, past the islands Gotland, Oland, Bornholm, and then the unloading in the German ports. The iron ore was loaded almost at the Arctic Circle and was transported across the entire Baltic Sea from the northernmost to the southernmost ports. Neither the British, nor the French, nor any other fleets posed any threat to the transport of iron ore across the Baltic. For a foreign fleet, breaking into the Baltic Sea was like breaking into a mousetrap and staying trapped there. But the Soviet Navy did not need to break into anything. It was already there, in its bases, peacefully awaiting the right opportunity.

For defending the Soviet Union a fleet in the Baltic Sea is not needed at all. Prior to 1940, the Soviet Union held a very small piece of seashore there. For more than two hundred years St. Petersburg (known as Leningrad in the Soviet era) was the capital of the empire, and for that reason along this stretch of shoreline all the Russian tsars, beginning with Peter the Great, had erected fortifications. The entire shoreline was transformed into a chain of sea fortresses, fortified regions, and coastal artillery batteries.

A coastal battery is something more impressive than a field artillery battery. A coastal battery can be compared to the artillery turret of battleships and cruisers. Under these turrets there are labyrinths of concrete casemates. A battleship turret weighs several hundred tons, sometimes even several thousand. Unlike the one on the ship, the same gun turret mounted on land can be defended by armored plates of any weight. Under the turret it is possible to erect casemates from fortified concrete with walls of any thickness. And it must be said that the Russian tsars put down enough concrete and steel in St. Petersburg's surroundings, and the Bolsheviks added even more.

The coastline defenses of the Soviet Union's Baltic fleet on June 21, 1941, had 124 coastal batteries armed with 253 weapons from 100 to 406 mm in caliber and 60 weapons that were 45 and 76 mm in caliber.³

The statistics of the coastline defense weapons are impressive. For example, a 305-mm cannon could launch shells weighing 470 kg to a distance of 43.9 km. One of the turrets had the capacity to fire six rounds a minute, almost three tons of metal. A 406-mm weapon launched a shell weighing 1,108 kg to a distance of 45.5 km. This weapon was capable of firing the next round only twenty-four seconds after the preceding one.⁴

Aside from coastline batteries and forts, the Leningrad region had a rather impressive concentration of naval cannons on railroad platforms. These long-range weapons were parked in concrete hideaways. There is a web of railroads around Leningrad, so the long-range weapons on railroad platforms could be maneuvered quickly and fired from prearranged and well-concealed firing positions, and then quickly moved away. The most important weapon of railroad artillery was the 180-mm cannon with shells of 97.5 kg. It could fire five rounds a minute, and its range was 37.8 km. There were also even more powerful cannons: the 203-, 254-, and 356-mm. The 356-mm cannons on railroad transports shot shells weighing 747.8 kg and had a firing range of 44.6 km.

Three naval fortified regions protected the direct gateways to Leningrad: the Kronstadt, Izhorsk, and Luzhsk, so the routes to the city could be shelled by powerful crossfire from all directions. Each battery, each fort, each fortified region, and each naval base had ammunition and supplies enough to last them for the entire four years of the war. No one would have the idea of launching an amphibious assault here or storming the city. Besides, Leningrad had ninety-one anti-aircraft batteries with a total of 352 anti-aircraft cannons. Why on earth would the Baltic region need a fleet on top of all this?

If the Soviet Union meant to defend itself, it did not need battleships in the Baltic Sea. In case of need, even without battleships, it was possible to quickly unload barges full of mines at the mouth of the Gulf of Finland and thus to cut off the approach to Leningrad. In defensive warfare a Soviet Baltic fleet was unnecessary. In fact, that is what happened—the Soviet Baltic fleet stayed without action for the entire duration of the war. In the event of attack by an aggressor, the Soviet Baltic fleet was extremely vulnerable. The aggressor could simply block the Soviet fleet by laying a couple of hundred mines on the shallow accesses to the naval bases. Indeed, that was done by the German fleet in June 1941. In a defensive war, ships, especially large ones, are forced to sideswipe in a shallow and narrow gulf, trapped in a blind alley.

In 1939 Hitler launched World War II against the rest of the world, having in his possession only fifty-seven submarines. His opponents were the almighty British and French fleets and, potentially, the U.S. navy. Hitler's navy had to lead an uneven battle in the Atlantic and the Mediterranean. In the Baltic, Hitler had almost nothing left. In the summer of 1941 in the Baltic Sea, the German navy had only five training submarines and twenty-eight torpedo motorboats, some of which were also used for training. The rest were secondary forces: mine blockers, various motorboats, and minesweepers.⁵ But peace-loving comrade Stalin watched the struggle between Germany, France, and Britain and beefed up the might of his Baltic fleet. What for?

In 1933 Stalin had already said: "The Baltic Sea is a sealed bottle, and we can't open it."⁶ Nevertheless, out of every three battleships, Stalin kept two in the Baltic, as if in a corked bottle. In 1941 on the Baltic Sea alone Stalin had sixty-nine submarines.⁷ No one in the world had such a number of submarines collected in one place. What task could Stalin set before his battleships and submarines in the closed aquarium of the Baltic Sea? Only one: to sink German transports of iron ore. There was no other work there for them.

Aside from submarines and battleships, Stalin had two cruisers, twenty-one destroyers, forty-eight torpedo motorboats, and other forces. On the Baltic Sea, the German navy did not even have its own air force.⁸ The Soviet Baltic fleet had 656 war planes, mostly bombers and torpedo carriers.⁹ Once again we ask: what was this all for? Why such a huge quantity of torpedo carriers and bombers, if Hitler had no large ships in the Baltic? The answer is always the same: the targets were not his warships, but his transports of ore. At any moment, the Soviet fleet could have raised anchor, reached the German and Swedish ports, blocked them with thousands of mines, and sunk the defenseless transports. This would have ended the war for Germany, and this must have been known and understood in Berlin from the start. Hitler fought against Britain and France, while behind his back Stalin held up high a glittering ax.

At the end of November 1939, Stalin made a huge mistake—he launched a war against Finland. The victory in Finland was a second warning to Hitler that Stalin was approaching the Swedish sources of ore. The Red Army, acting on Stalin's orders, got through the Finnish

fortifications and halted its advance. Finland without the fortifications was defenseless. At any moment, Stalin could have given another order and renewed the advance of the Red Army. From Finnish territory it could have bombed Swedish ore mines and railroads unhindered. No one could have impeded this. The seizure of the Åland Islands alone would have been enough to close off the mouth of the Gulf of Bothnia, which would have meant an end to World War II with a Soviet victory.

And that was not all. In the part of Europe that was occupied by Hitler there are no forests. The forests are in Finland and Sweden. Any possible cessation of the shipment of lumber across the Baltic Sea carried with it a multitude of consequences, and all were negative. The wood was needed for building and restoring railroad ties and for mining coal, which was needed for forging steel. No wood meant no transport along the railroads. During peacetime in Germany there was already a yearly timber shortage of about 6 million tons. Instead of wood pulp they had to use potato foliage. The Fuehrer himself attests to that.¹⁰

But that was just during peacetime, when no one hindered the transport of timber across the Baltic Sea. As soon as Stalin's submarines struck German timber carriers, Germany would have wound up without wood at all. Potato stalks would not have sufficed to make up the shortage, because they cannot replace good wood in all its uses. It is possible to make poor quality paper out of them, but impossible to make railroad ties, impossible to timber coal mines.

On top of everything else, Germany had no nickel. It was impossible to fight without nickel—but the nickel supplies were in Finland. At the beginning of 1940, during the course of the war against Finland, the Red Army had seized control of the nickel mines in Petsamo, and then in the spring of 1940, according to the peace treaty, returned them. But now nickel was obtained according to joint Soviet-Finnish shareholding companies with the participation of Soviet engineers and workers. The Soviet government insisted that the director of the entire operation be a Soviet man. Nickel from Petsamo went to both Germany and the Soviet Union. Germany was receiving 70,000 tons from this area, or 70 percent of Germany's annual demand of this strategic mineral.¹¹ However, the nickel supply could be stopped at any moment. The Soviet 104th Rifle Division, under Major General Morozov (of the 42nd Rifle Corps of the 14th Army) stood right outside the nickel mines.

German strategists did not fear a new Soviet invasion of Finland in vain. On November 25, 1940, the People's Commissar of Defense of the USSR, Marshal of the Soviet Union S. K. Timoshenko, and Chief of General Staff of the Red Army General K. A. Meretskov signed a directive to the staff of the Leningrad military district. Only one copy of the document was produced, and it was labeled top secret and especially important. Let's remember the date—November 25, 1940—we will return to it later on.

The document begins by saying:

In the conditions of war only against Finland, the USSR establishes, for convenience of control and material supply, two fronts: the Northern front for action on the shoreline of the Barents Sea and in the direction of Rovaniemi, Kemi and Oulu; the Northwestern front for actions directed toward Kuopio, Mikkeli and Helsinki. The leadership of the Northwestern front falls on the shoulders of the command and staff of the Leningrad military district. It is ordered to start the development of plans for operations opening up the Northwestern front. . . . The main objectives of the

Northwestern front are set: destruction of Finland's armed forces, gaining control of her territories within the boundaries, and gaining access to the Gulf of Bothnia by the forty-fifth day of the operation. . . . On the right, the Northern front (its staff in Kandalaksha) on the fortieth day of mobilization moves to assault, and on the thirtieth day of the operation gains control of the regions of Kemi and Oulu. . . . The Red-Flag Baltic fleet, subordinate in all operations to the Military Council of the Northwestern front, is issued the following tasks: Working jointly with the air force, destroy the active navy of Finland and Sweden (in case of involvement by the latter). Assist the ground forces, acting on the Finland Gulf shore and from the Hanko peninsula, by supplying their flanks and destroying the coastal defenses of the Finns. Provide the transfer of two rifle divisions during the first few days of the war from the northern shore of the Estonian SSR to the Hanko peninsula, as well as transporting and launching an amphibious assault on the Åland Islands. Through cruiser operations of submarines and air forces, interrupt Finnish-Swedish naval communications (in the event of the latter's interference against the USSR) in the Gulf of Bothnia and the Baltic Sea.

This plan of action was given the name "S.3-20." The plan was to be put into action at the moment of receipt of a coded telegram with the signature of the chief of the general staff and the following contents: "Commence execution of plan 'S.3-20'."¹²

In this plan there was no mention of the fact that the Soviet Union would fight for the "guarantee of safety to the city of Lenin," that is, Leningrad. And there were no hints that military actions must be initiated only in response to enemy aggression. The usual words "if the enemy wages war upon us . . ." were absent. Here, it was much simpler: at any moment, the Leningrad staff would receive a telegram from Moscow, and Soviet armies would advance to the Gulf of Bothnia, to the Swedish border, to the Åland Islands! The trusted comrades at the right moment would set up a new "provocation of the Finnish war machine on our frontier," and those whose job it was to do so would explain to the workers of the world the meaning of the "peace-loving global politics of the USSR" and the necessity of our "counterblows to the Finnish aggressors."

The plan "S.3-20" could have been a stand-alone one, but it could also have been part of a much broader scheme. The plan "S.3-20" allowed the armies of the Leningrad and Arkhangelsk districts, together with the Baltic fleet, to deliver blows to Finland before the Red Army hit Germany, simultaneously, or slightly later. But in any case, the blow to Finland was also a blow to Germany. In the event of putting plan "S.3-20" into action, Soviet troops were to seize the nickel mines in Petsamo and the Åland Islands, and make their way to the city of Kemi. It was not a coincidence that in 1940, on the Baltic Sea, the first marine infantry brigade was formed under the leadership of the Soviet saboteur Colonel Parafilo. It remained only to send to the Leningrad headquarters the coded message: "Bring plan into execution." There is no need to search for a plan for war against Germany. If plan "S.3-20" had been realized, it meant a deadly blow not only to Finland, but to Germany as well.

In the summer of 1940, Stalin committed another error: he brought Estonia, Latvia, and Lithuania into the Soviet Union, organized on their territory the Baltic special military district, and concentrated all the forces of that region on the border of Eastern Prussia. This was completely unnecessary, and even harmful, for defense. Some say that Stalin moved his border to the West and thus strengthened the safety of the USSR. But in fact the situation

was exactly the opposite. Before the occupation of the Baltic states, the Red Army had a divisive barrier in this region. Consequently, in the event of aggression Hitler's armies had to crush the armed forces of three independent states before meeting the Red Army. Even if he had to spend only a few days in order to crush the armies of Latvia, Lithuania, and Estonia, a surprise attack on Soviet airbases in this direction would have been out of the question. The Red Army would have had the chance to put its forces on high alert and take its positions. After the destruction of the three states' armies Hitler's forces would have approached Lake Chudskoe, which is impossible to cross. If they had tried to go around the lake, Hitler's armies would have come straight into Soviet fortified areas.

But everything unfolded according to a different scenario. The Red Army came out of its fortified areas to the front lines in Lithuania, right up to the German border, and transferred there its air bases, staff headquarters, communication centers, and strategic supply resources. For the people of the three Baltic states, Stalin's army became the aggressor and occupant, and Germany, if it decided to attack the USSR, would have become the liberator.

On June 22, 1941, the Red Army suffered a surprise attack from the German armies along the entire stretch of the border, including the Baltic states. The command centers were disrupted and Soviet aviation suffered significant losses on border air bases. Moreover, a widespread popular uprising in the Baltic states flared up against the Red Army. The Soviet "liberators" were shot at from every rooftop. The Red Army was left in the Baltic region without any fortified regions, and behind their backs, on Russian territory, remained empty fortified areas without any troops. German troops led by General Field Marshal von Manstein seized them immediately.

Skeptics disagree: if Stalin had not occupied the Baltic states, Hitler could have seized them without war, by simply moving his troops there as he did in Czechoslovakia. To this theory, there is a rebuttal. It should have been explained to Hitler clearly that if German troops attempted to enter the Baltic states area, the Soviet Union, without warning, would begin sinking German transports of ore and wood in the Baltic Sea, setting up mines in the entryways of German ports, and bombing Berlin. The Soviet Union would form international brigades and launch them into the Baltic states' territory together with millions of Soviet volunteers. And when Hitler's forces grew weak in the war with the USSR, Britain and France would use the opportunity and strangle Germany according to their best interests, eliminating it as a dangerous adversary and once again imposing retributions.

Such a declaration would have been correctly understood around the world. In such an event the people of the Baltic states would not have been enemies of the Soviets, but their allies. In such an event, the "forest brothers" (the Baltic states' partisans) would have been shooting the backs of German soldiers, not the Soviets. In such an event, international brigades would have been fighting on the side of the Baltic states. There were always enough volunteers to be found around the world.

In August 1939 the Soviet Union's position was announced loud and clear: Mongolian territory will be defended from Japanese aggression as if it was our own. And that was done! This position was correctly understood in the entire world, including Japan. As a result of this decisiveness and strictness, Japanese aggression against the Soviet Union was averted. Why did the Soviet Union, in 1939, not take the same position regarding the Baltic states?

The occupation of those states by the Red Army made sense only if there were plans for an aggressive war against Germany. The Red Army came right up to the German border and

transferred its air bases to the very front edge of that border. From the bases in Lithuania it could support the advance of Soviet troops right up to Berlin. Additionally, the Soviet navy received naval bases in Tallinn, Riga, and Liepāja. The primary forces of the navy and reserves were immediately transferred there. From Liepāja to the routes taken by caravans carrying ore, nickel, and wood to Germany, there was a very small distance. A strike from this area could be sudden and crippling.

For Hitler, this would have been the curtain call. Hitler understood that at any moment the Soviet fleet could cut the only tie binding the faraway Swedish ports with the metal-forging bases in Germany.

The Carving Up of Romania, and its Consequences

Had we not succeeded in halting Russian troops during their entrance into Romania and forcing them to be content with obtaining only Bessarabia, they would have taken the Romanian oil fields, and no later than that same spring they would have crushed us, for we would have lost all sources of fuel.

—ADOLF HITLER, MAY 18, 1942

Stalin strove to persuade Hitler that he wanted peace. At the same time, Stalin very persistently crawled toward the vital life-sustaining resources of Germany. For Stalin, it was not enough that the Red Army and fleet had under their control all the routes through which Germany got her iron ore, timber, and nickel. Stalin decided to move his divisions right up to the regions from which Germany received its petroleum supplies.

In August 1939, Stalin (with Molotov's hand) signed a pact, according to which Hitler got a war on two fronts, and according to which the British fleet blocked Germany and did not allow petroleum shipments to come in by sea. Germany had only one possible source of oil significant enough to be noted—Ploiești in Romania. The loss of this source of oil would have put a complete stop to German production, army, aviation, and navy. On June 9, 1940, the People's Commissar for Defense, Marshal of the Soviet Union S. K. Timoshenko, signed a directive about the creation of the southern front. General G. K. Zhukov was nominated to command that front. The front consisted of the 5th, 9th, and 12th armies. Overall, the southern front consisted of thirteen corps: ten rifle corps and three mounted corps. Together there were forty divisions: thirty-two rifle divisions, two motorized rifle divisions, and six mounted divisions. There were fourteen separate brigades: eleven tank brigades and three paratroop brigades. Reinforcements consisted of sixteen heavy artillery regiments and four artillery battalions of high power. The Southern front's aviation consisted of twenty-one fighter and twenty-four bomber regiments. The total number of troops was 460,000 soldiers and officers, using twelve thousand guns, three thousand tanks, and two thousand planes.

Having concentrated such might on the Romanian border, Stalin ordered Zhukov to use threats or battle to obtain Bessarabia and Northern Bukovina from Romania, and to

secure arm's-length access to Romania's undefended oil fields, which were two hundred kilometers from the border.

Zhukov's Southern front was ready to crush Romania, but in the summer of 1940 he did not have to fight. Romania's leaders had witnessed the brilliant victories sustained by the Red Army in Finland and had a clear understanding that it was better to accede to Stalin's wishes without battle. The sides agreed to a peaceful resolution of the conflict. At the end of June 1940 Romanian troops retreated from and Soviet troops entered Bessarabia and Northern Bukovina. These territories were added to the constituency of the Soviet Union.

In June 1940 three paths were open before the Southern front commanded by General Zhukov: two were correct, one was deadly. The first correct path: deliver a blow to Bessarabia and continue to advance toward the oil fields of Ploiești. Three thousand Soviet tanks and two thousand airplanes were more than enough to reach the oil fields and ignite a fire. This would have meant the end for Germany. If the Southern front in June 1940 had dealt a blow to Romania, World War II would have ended in 1940 with a victory by the Soviet Union and an establishment of Communist regimes over the entire European continent. If the events had unfolded in such a manner, giant colonies of the French, Belgian, and Dutch empires would have been transferred to Stalin's control.

The second path was more risky, but promised even more victories: in June 1940 Stalin could have simply done nothing. He could have waited. He would not have had to wait much longer. After defeating France, Hitler could have delivered a blow to Britain. The risk for Stalin lay only in the fact that after the defeat of France, Britain and Germany could have concluded peace. In that case, Stalin would have been left one-on-one against Germany. However, if Hitler, as he planned, landed his troops in Britain, the task of "liberating" Europe became much simpler: Zhukov would have struck the Romanian oil fields, then the Red Army would have begun its "liberating operations" in Europe, all while the best German troops were off the continent, in Britain, from where they could return immediately.

The third path was deadly. In June 1940 Zhukov's Southern front took over Bessarabia and Northern Bukovina—then halted halfway to the oilfields of Ploiești.

Hitler said in 1942 that he was able to force Stalin to be satisfied in 1940 with Bessarabia alone. This was not so. Firstly, in the summer of 1940 Stalin had not yet set for Zhukov the objective of crushing Romania. Secondly, in 1940, in the heat of the fighting in France, Hitler had no means of exerting influence over Stalin. If Stalin had ordered his troops to crush Romania in the summer of 1940, nobody would have been capable of stopping the advance of Zhukov's Southern front.

As a result of the "liberation crusades" the distance from the new Soviet frontier to the oil fields of Ploiești was now just 180 km. This was a clear, open area. Troops from the Odessa military district were concentrated at the very border, ready as soon as they got the first order to continue the "liberation" right up to the oil wells. Soviet tanks numbered over three thousand; the Romanians had sixty tanks. The Soviet "obsolete" BT-7M tank even officially had a speed of 86 km/h (in reality it was faster). The Romanian tanks opposing it were FT-17s, and had a maximum speed of 9 km/h. Therefore, the Soviet tanks could just disregard their Romanian opponents, ignore them and bypass them at their will. Even if one were to set one thousand Soviet tanks against sixty Romanian ones, even then the remaining two thousand could advance to Ploiești unhindered, without leaving the main road and without maneuvers. Even if they were to advance at only 25 km/h, they would have needed only seven to eight

hours—one night! Moreover, Stalin did not just have simple tanks, but fast-moving ones, made especially for such advances. The area ahead of them was even and flat, the ground was hard, and the roads were in good condition. The BT tanks could easily reach a speed of 40 to 50 km/h here, and without their tracks that would rise to 70 to 80 km/h. That would have come to only three hours of plain driving time. And it was not at all necessary for all the tanks to reach the oil wells. If only ten tanks had reached them that would have sufficed. Oil fields can be ignited with incendiary shells, or even with a simple soldier's lighter. Without oil, one cannot fight. Oil is not only fuel; it is also a raw resource for the chemical industry, without which one cannot get by. If only one Soviet tank company of ten tanks had wound up in the Ploiești vicinity, and if each driver had had a box of matches, the war in Europe would have ended with the early defeat of the Third Reich.

A seizure of Ploiești by Soviet troops, or just a fire in the oil production areas, would have meant paralysis for Germany. In the event of Ploiești falling to the Soviets, all German tanks, automobiles, cruisers, battleships, submarines, and airplanes would have been stopped in their tracks. Who cares that you have talented generals, officers, soldiers, pilots, and artillerymen? Without fuel all their talents would be completely useless. A freeze on oil supply to the German war machine opened up the way for thousands of other Soviet tanks. From Brest and Lvov, from Belostok and Grodno, the road to Berlin was now very short. If the German army and aviation were paralyzed, and no one offered resistance, then on good roads the tank units could reach not only Berlin and Munich, but Paris and Marseille as well.

In May and June of 1940 Hitler was crushing the armies of Britain, Belgium, Holland, and France. German tank units headed for the Atlantic Ocean, making a huge detour around Paris. Practically the entire Germany army fought in the West. Hitler victoriously crushed France and British troops on the continent. Against France and Britain, Hitler threw his entire naval fleet, air force, all his tanks, and all his heavy artillery. The best German generals fought there. And in the rear, on the borders of the Soviet Union, Hitler left only ten weak infantry divisions. Here, there was not a single tank, a single airplane, a single heavy artillery weapon. Most importantly, the ten infantry divisions were all in Poland and Slovakia. In Romania, there were no German troops.

In June 1940 neither Hitler nor his generals had any intentions or plans to attack the Soviet Union. The *Oberkommando des Heeres* (OKH—German Army High Command) and the *Oberkommando der Wehrmacht* (OKW—Supreme Command of the Armed Forces) had neither rough drafts nor preliminary designs for a war against the USSR. They had no orders from Hitler in this regard. Not a word was said about war against the USSR.

After the defeat of France, Hitler ordered a drastic reduction in German armed forces. This reduction was widespread and intense, for there were no plans, hints, or foresight indicating that a war against the Soviet Union might be approaching. And all at once came the Soviet strike against Romania. Oil is the blood of war. Without oil, fighting becomes impossible. Stalin's axe was raised over the oil production in Romania.

In Berlin, it was finally recognized that the Soviet threat to Germany was lethal. Soviet tanks advanced to Romania, causing chaos in German headquarters: if the tanks did not stop, if they advanced another 180 km, then Germany would capitulate within the next few months. Romanian troops made no resistance and put up no obstacles to the Soviet advance. There were no German troops in Romania. It was impossible to quickly transfer troops from France. Even if it had been possible, a large number of German troops in Romania could

not have received adequate supplies. Even if it had been possible to provide supplies, then Germany would have been forced to have fewer troops in Poland, meaning an even more direct road to Berlin would have been laid open to Stalin's tanks.

Soviet troops occupied Bessarabia and Northern Bukovina and stopped. Berlin breathed a sigh of relief. However, what would have happened if, the next day, Stalin had ordered the advance to continue? A solution was found: in case of an emergency, it would be necessary to deliver a warning blow to the Soviet Union, using ten divisions in another location, thereby creating for the Red Army a diversion from Romania. After conducting the battles on maps, the German high command understood that ten divisions would be insufficient. They decided to use twenty, and saw the same result. They increased the number of divisions, again and again. In the end, it was decided: in order to not allow Stalin to seize or destroy the oil industry in Romania, it was necessary to deliver a blow to the Soviet Union with the might of the entire German armed forces.

On July 21, 1940, Hitler for the first time in a very tight circle uttered the idea of the "Russian problem." On July 21 the head of ground forces, General Field Marshal W. Brauchitsch, received an order from Hitler to begin developing a specific plan for war in the East. The next day, Brauchitsch entrusted Halder, the head of general staff for ground forces, with fully evaluating all the different potentialities "in a military operation against Russia." Major General Erich Marcks was then appointed to Halder's staff as an aide for developing the specifics of the eastern campaign. On July 29 Marcks began planning a military campaign against Russia.¹

For the Soviet Union, the consequences of a bloodless victory in Romania were catastrophic. First of all, neutral Romania was faced with a terrible choice: whose side should it take? Europe was being torn into pieces by two monsters, Hitler and Stalin. Stalin had suddenly demanded Bessarabia and Northern Bukovina, and Romania was forced to give them up. What would Stalin demand tomorrow? Hitler, on the other hand, did not demand anything. The choice was simple, and Romania got Hitler's protection. The result: the Soviet Union obtained another hostile country along its border; the front, that was supposed to protect the USSR in case of war, stretched for almost another eight hundred kilometers; and Hitler received an ally that held oil. Without oil, Germany could not fight. In other words, having Romania in his arms, Hitler could attack the Soviet Union. Without this new alliance the attack would have been impossible. But the most important effect lay in something else. Stalin frightened Hitler. It was precisely the "liberation" of Bessarabia and Northern Bukovina that acted as the last warning for Hitler. A direct Soviet threat arose over the oil fields of Romania, and precisely because of this threat Hitler ordered his commanders to prepare a strike against the Soviet Union.

In Stalin's career there were few errors. One of the few, but the most significant one, was the occupation of Bessarabia in 1940. He could have taken Bessarabia and continued on to Ploiești, which would have meant the destruction of Germany. Or, he could have waited until Hitler landed troops in Britain, and after that he could have taken over all of Romania. This too would have ended the "thousand-year Reich." Stalin, however, made one step in the direction of oil, took over the launching ground for the next attack—and stopped to wait. Through these actions, he showed interest in Romanian oil and alarmed Hitler, who before this had concentrated on the West, North, and South, without paying much attention to "neutral" Stalin in the East.

On July 16, 1940, Hitler signed the directive No.16 concerning preparations for landing troops in Great Britain. The operation was given the code name *Zeelowe* (Sea Lion); the plan was for the operation to be completed by August 15. But the annexation of Bessarabia, Northern Bukovina, Estonia, Latvia, and Lithuania into the Soviet Union forced Hitler to make a sharp U-turn and look at what was happening behind his back.

Why did Stalin need Bessarabia and Northern Bukovina? Here is the official answer of the Soviet historians to that question: "From the Bessarabian territory, the Soviet air force could keep Romanian oil industry, which was the main supplier of oil to Germany, under constant threat. Northern Bukovina was needed because through its territory went a railroad of strategic importance, which stretched from Odessa through Kishinev, Chernovtsi, to Lvov, and which had a European track which enabled it to allow usage by railroad cars from all over Europe."²

Here is what Hitler had said regarding the same matter, but half a century earlier:

It is absolutely obvious that the Soviets were determined to direct the unfolding of events in the Balkans in the direction necessary to them, and in that manner to transform the area into launching grounds for an attack on us and the remaining countries of Europe. And, doing everything possible to achieve this goal, they simultaneously declared readiness to sign trade agreements with us, which would seem to be favorable to us but would in fact cut us off from our oil sources as soon as their preparations for the decisive coup were finished. In the summer of 1941 they intended to deliver a crushing defeat to Romania, for it was the only country, except Russia, that delivered us oil.³

Soviet historiography advanced Hitler's argument. It talks not only of a real Soviet threat to the only German oil source, but also about a segment of railway for European cars. In the Soviet Union, the railways use a broad gauge. Central and Western Europe use a narrow gauge. In September 1939, during the partition of Poland, the Red Army seized half of Poland's locomotives and railroad cars. They were useless in the territory of the Soviet Union, because the gauge on the "liberated" territories was quickly changed to fit the broad Soviet standard. But Stalin prepared for the "liberation" of Germany and the rest of Europe. During the course of the first future operations, before the German gauge was amended to fit the Soviet standard, Stalin would need many locomotives and trains with a narrow gauge to supply his troops that were quickly moving westward. The Polish locomotives and trains clearly did not suffice to supply millions of tons of ammunition, arms, liquid fuel, and spare parts. That is why Stalin took Bessarabia and Northern Bukovina—to expand the number of trains for railways with a narrow gauge. In the course of the Bessarabian campaign, Soviet forces captured 141 locomotives, 1,866 covered train cars, 325 half-covered train cars, 45 platforms, 19 cisterns, 31 passenger cars, and 2 luggage cars.⁴ But even that was not enough for Stalin. At the Soviet-Romanian talks in July 1940, regarding the settlement of contested issues, the Soviet representatives demanded that Romania return all captured mobile railroad units. On July 31, 1940, the two sides signed an agreement on the transfer of 175 locomotives and 4,375 cars to the USSR by August 25.⁵

In a defensive war, trains seized in Poland, Bessarabia, and Northern Bukovina would not have been needed. Thus, Stalin needed Bessarabia and Northern Bukovina not for defense, not in order to "bring the people happiness." Stalin's plot was much broader and deeper: to take Hitler by the throat and to bring "happiness" to all of Europe.

A question arises: are we not giving too much importance to the role played by Romanian oil? Did not Germany establish her own production of synthetic fuel? Such an industry did indeed exist, but the problem of fuel was still not resolved. First of all, it is important to keep in mind that synthetic fuel can never compete in quality with fuel made from petroleum. The use of synthetic fuel significantly lowers the tactical and technical characteristics of weaponry, most of all airplanes, tanks, and ships. Your designers can create a wonderful aircraft, your factories can have the best technological capabilities in the world, your workers and engineers can put into the building process of the plane all their talent and effort, but with low-quality fuel the plane will still be slow, weak, and clumsy.

On top of all this, synthetic fuel is also expensive. With timber, if there was a shortage, Hitler's Germany used potato stalks. Even though they were lower in quality than wood, at least they were cheap. But the production of synthetic fuel costs seven to twelve times as much as the production of fuel from petroleum. Hitler's decision to use synthetic fuel was not born out of good fortunes. Very few would be willing to repeat his experiences. The following facts enable us to judge the quality and costs of synthetic fuel. In the second half of the twentieth century the world suffered from an oil crisis more than once. At the beginning of the new millennium, the global chemical industry is far more powerful than the chemical industry of Germany in 1941. And still, for some reason there is no rush to produce synthetic fuels today.

Now, let us talk about quantity. Germany's minimum requirements for oil in 1941 were estimated at around 20 million tons.⁶ Hitler had allies who had armies, navies, and air forces, but they too did not have petroleum. They too had to be supplied by German fuel. Germany in 1941 was producing 4.1 million tons of synthetic fuel—one-fifth of the bare minimum. If one keeps in mind the allies, with whom Germany had to share, then the percentage of synthetic fuel in the overall balance of 1941 is completely insignificant. Aside from synthetic fuel, real petroleum came to Germany from Austria, Czechoslovakia, France, Hungary, and Poland. Altogether, in 1941 that made 1.3 million tons. So for 1941 Germany made synthetic fuel and received real petroleum from occupied countries—together, this makes 5.4 million tons of fuel. Without the Romanian oil, with the remaining amount of fuel the German armies, navies, air forces, transport, and industry would have been able to fight for only three months out of the year and would have had to spend the remaining nine months shivering—until the next year.

Hitler thought that if the Red Army defeated Romania in 1940 or 1941, without Romanian oil Germany could hold on until the spring of 1942. This optimism cannot hold up when checked with arithmetic. Without Romanian oil only a quarter of the needs of the German economy and armed forces would have been met, and with poor and very expensive fuel at that. A taking of Romania by the Red Army in 1940 or 1941 would have turned into a catastrophe for Germany within two to three months.

How much oil was coming from Romania? In 1941, 5 million tons came in. This was not enough. But without it living and fighting were made impossible. While receiving oil from Romania, Germany could balance on a tightrope, somehow making do with an amount about half of its minimum needs. The petroleum situation in the invading army (which, clearly, was in a privileged position relative to all other consumers) on the eve of the war against the Soviet Union was the following: aircraft fuel was more or less in good supply; car and diesel fuel, on the other hand, was predicted to be at a 10 percent deficit even in July, and

by August, the army on the Eastern front was going to have to be fueled, for the most part, by supplies directly out of Romania. By fall, the German petroleum reserves were predicted to be completely exhausted, with aircraft fuel only at 50 percent of the required amount, car fuel at 25 percent, and diesel fuel at 50 percent.⁷ Thus, the German high command depended heavily on the brevity of the Russian campaign, on shipments from Romania, and on plundered reserves.

During the course of the entire war, Germany's problem with petroleum was never resolved. On June 6, 1942, the OKW evaluated the situation: "The supply of fuel and oil materials in the current year will be one of the weaknesses of our military potential. The shortage of oil materials of all sorts is so great that freedom of operations will be threatened in all three branches of the armed forces, and will have a negative effect on military industry as well. . . . A small improvement can be anticipated toward the end of the year, when new factories for the production of synthetic fuel will be launched, but this will not bring a drastic improvement in the supply of Germany."⁸ Germany's supply worsened as the war progressed. Toward the end of the war, Germany was the first in the world to start producing jet-engine planes. The Me-262 fighter surpassed all other planes in speed and weapons. Germany produced 1,433 of them. However, there was not enough kerosene, and without kerosene the best fighter in the world could not fly. Out of almost 1,500 planes of this type built, only slightly more than two hundred took part in battles. The rest remained on the ground.

In the summer of 1940 Stalin made a fateful mistake. Already in 1939 Hitler had found himself in a strategic dead end, without an exit. In 1940 Stalin raised axes over Hitler's head from two sides: over iron ore, timber, and nickel in the north, and over oil in the south. Stalin stalled, waiting for Hitler to attack Britain. But in 1941 Britain was not dangerous to Hitler. The danger came from Stalin. Hitler had no other choice. So, he jumped on Stalin. On June 21, 1941, Hitler wrote a letter to Mussolini: "Russia is trying to destroy the Romanian oil fields. . . . The task for our armies is eliminating this threat as soon as possible." Herein lies the cause of Hitler's attack. This was not at all a struggle for *Lebensraum* (living space).

The strategic miscalculations of 1940 were so rough, deep, and frightening that their catastrophic consequences for the fate of the Soviet Union could not later be resolved by any genius decisions and brilliant victories. Because of Stalin's and Zhukov's mistakes, Hitler attacked the Soviet Union, destroyed its army, and crushed a large part of Soviet industry. In the end, the Soviet Union was unable to conquer Europe. Stalin lost the war for Europe and global domination. The free world survived, and it could not coexist with the Soviet Union. Therefore, the crumbling of the Soviet Union became inevitable. The roots of that crumbling lie in Zhukov's victorious venture into Bessarabia and Northern Bukovina in the summer of 1940. The Soviet Union won World War II, but for some reason disappeared from the globe after this distinguishing victory. When Communists celebrate the so-called "victory day," I ask: Where is this great victorious country? Where did it disappear? Germany lost the war, but we see her, one of the mightiest powers of contemporary Europe, at whose feet we now beg. So where is the great, mighty, uncrushable Soviet Union? Germany lost, but it is still here. The Soviet Union won, but it no longer exists. Who needs such a victory?

Destruction of the Buffer States between Germany and the Soviet Union

We are doing a deed that, if it succeeds, will turn the whole world upside down and will free the entire workers' class.

—J. STALIN, IN *PRAVDA*, FEBRUARY 5, 1931

It is a fact of history that on June 22, 1941, Germany attacked the Soviet Union, suddenly and treacherously. However, it is a very strange fact. Before World War II, Germany had no common border with the Soviet Union and therefore could not attack it, especially in a sudden fashion. Germany and the Soviet Union were separated by a solid barrier of neutral countries. In order for the Soviet-German war to take place, it was necessary to create the right conditions: to destroy the barrier of neutral countries and establish common Soviet-German borders.

Everyone interested in the date June 22, 1941, before cursing Hitler and accusing him of treachery, has to answer at least two questions: who destroyed the buffer row of neutral countries between Germany and the Soviet Union and what for? The barrier between Germany and the USSR was double-layered, and only in one place single-layered. Poland was the only country that had at once a border with both Germany and the Soviet Union. Poland is the shortest, most direct, most convenient route between the USSR and Germany. Poland is the thinnest part of the dividing wall between the two countries. Obviously, the potential aggressor, wishing for a Soviet-German war to take place, would try to cut a corridor precisely in this location. Contrarily, the country not wishing for a war should, with all its might, all its wisdom, all the force of its international authority, not allow its adversary to penetrate Polish territory. Or, as a last resort, begin fighting that opponent on Polish soil, without letting him on its territory.

Hitler wrote in *Mein Kampf*: “We want to return to that point, at which our previous development six hundred years ago was halted. We want to halt Germany’s constant advance to the south and the west of Europe and decisively point our finger in the direction of territories located in the east.” In the 1930s, especially after the Nazis came to power, Hitler’s

frankness sounded with a new power. But Hitler could not attack Stalin, because they did not share any borders.

Hitler began his movement to the east by turning to Stalin with a proposal for joint efforts in making a hole in the dividing wall between them. Stalin, with pleasure, accepted and enthusiastically tore down the Polish wall, hacking a corridor to meet Hitler. Hitler's motives were understandable. But how does one explain Stalin's actions?

Communist historians invented explanations for the deeds of the Soviet Union. The first explanation: having bloodied and ripped apart Poland, the Soviet Union moved its frontiers to the west, and thus fortified its security. What a strange explanation. Soviet frontiers were indeed moved two to three hundred kilometers, but at the same time Germany moved its frontiers two to three hundred kilometers to the east. This move decreased, rather than increased, the Soviet Union's security. Furthermore, the completely new factor of a common Soviet-German border arose, which carried as a consequence the possibility of sudden war between Germany and the Soviet Union. Explanation number two: having axed Poland in the back at the moment of her desperate fight against the Nazis, Stalin attempted to delay the moment the Soviet-German war would start. This explanation stems from the old pretext: we started a fire in the neighbor's house, hoping that the fire will reach and destroy our house later than it destroys his. The third explanation: France and Great Britain did not want to make a deal with the Soviet Union. It is a blatant lie. France and Great Britain did want an anti-Hitler treaty with the USSR and started negotiations in Moscow. The negotiations were suddenly stopped by the Soviets who immediately signed the Molotov-Ribbentrop Pact with Germany.

Poland, Estonia, Lithuania, Latvia, Finland, and Romania were natural allies of the USSR. Unlike France and Britain, these countries were potential victims of Hitler's *Drang Nach Ost* (Drive towards the East). With them, the USSR should have sought an alliance against Hitler. But Stalin was not seeking such an alliance, and in the cases where pacts did exist, the Soviet Union did not act in accordance with them. Stalin could have remained neutral, but instead he stabbed in the back those who fought against Hitler.

Having crushed Poland, Hitler broke a corridor through the dividing wall. Now, he had a common border with the Soviet Union that was 570 km in length. Hitler calculated this to be sufficient and went back to his affairs in the west, in Africa, in the Mediterranean, and in the Atlantic. What should Stalin have done, when presented with a corridor 570 km in length and with some time to spare? He should have hurriedly fortified his defenses precisely in this area. Along the old borders, there was a powerful row of fortified regions. It should have immediately been reinforced and improved. And it should have been complemented by a second line of defense, and a third, fourth, and fifth line. He should have urgently begun to lay mines under roads, bridges, fields, begun to dig anti-tank trenches and cover them with anti-tank artillery.

Sometime later, in 1943 in Kursk, the Red Army prepared to push back the advance of the Germans. During a short period of time Soviet troops created on the huge front six continuous lines of defense, each one hundreds of kilometers in length. The lines were situated one behind the other, so the total depth of defense was 250 to 300 km. Each kilometer was saturated with trenches, communication tunnels, covers, and firing positions. The average concentration of mines in a given area was brought to seven thousand anti-tank and

anti-personnel mines per kilometer of front line. The concentration of anti-tank weapons was brought to a mind-blowing level: forty-one cannons per kilometer, not counting field and anti-aircraft artillery and dug-in tanks. In no time an empty field was transformed into a truly impenetrable defense.

In 1939 conditions for defense were much more favorable: forests, rivers, swamps, few roads, and lots of time. Soviet troops could have created a powerful barrier on the new Soviet-German border, especially since the opening was not wide. But at that moment the Soviet Union stopped producing anti-tank and anti-aircraft cannon. Instead of making the area impassable, it was quickly made more penetrable. The Red Army built bridges and roads, expanded and improved the railroads. Previously existing fortifications were torn down and buried under mounds of ground. One participant of those events, professor and Colonel I. G. Starinov of the GRU, candidly described what went on: "A stupid situation arose. When we faced weak armies of small countries, our borders were truly locked. But when Nazi Germany became our neighbor, the defense structures along the former border were abandoned and even partly dismantled."¹ And: "Engineering command of the Red Army sent a request for 120,000 railroad mines of delayed action. In the event of an invasion, this amount would have sufficed to paralyze the German army's supply routes from the rear, on which it entirely depended. But instead of the requested amount, they sent . . . 120 mines."² By the way, a mine is the most simple, most inexpensive, and highly effective weapon. The Soviet Union had huge land mine production, but after the new borders with Germany were established this production was curbed.

What did Stalin do aside from dismantling his own defenses? He also tore to pieces the barrier of neutral countries. For Hitler, one hole in the wall was enough. For Stalin, it was not. Hitler (with Stalin's help) demolished the leadership of only one country in the dividing barrier—Poland. Stalin (without outside help) did the same in three countries (Estonia, Latvia, and Lithuania), tried to do it in a fourth country (Finland), and actively prepared for doing it in a fifth country (Romania), having first ripped from it a huge chunk of land. Hitler strove to force only one opening in the wall, Stalin tried to demolish the entire wall.³ And Stalin accomplished his goal. Only ten months after the signing of the non-aggression pact the dividing barrier was completely destroyed, from the Arctic Ocean to the Black Sea, by Stalin's efforts. There remained no neutral countries between Stalin and Hitler, and thus the conditions for attack were set.

During this short time all of Stalin's neighbors to the west became his victims. Aside from nations sharing borders with the Soviet Union, Lithuania, which did not have any common borders with the USSR at all, also fell under Stalin's domination. The appearance of Soviet troops in Lithuania meant that they had truly reached Germany's real borders: from September 1939 the Soviet-German border passed through the conquered Polish territories, and from the summer of 1940, Soviet troops came to the border of Eastern Prussia. Here it cannot at all be said that the monstrous Hitler was hacking corridors to the east, and the stupid Stalin was assisting him. No, Stalin hacked corridors to the west without any outside help.

Did the Red Army plan to stop at the borders it attained? The answer was given by the People's Commissar of Defense of the USSR, Marshal of the Soviet Union S. K. Timoshenko: "In Lithuania, Latvia, Estonia we destroyed a power of landowners and capitalists hateful to the workers. The Soviet Union grew significantly and advanced its borders to the west. The

capitalist world was forced to tremble and cede to our will. We, the fighters of the Red Army, should not be content and stop at what has been attained!”⁴ This was not the speech of a politician and not the announcement of a journalist. It was an official decree for the Red Army. But to the west of Soviet borders there was only Germany, or her allies; and a pact had been signed with Germany

Stalin made no secret of how a true Communist should view promises and pacts: “The question of struggle . . . needs to be examined not from the standpoint of fairness, but from the standpoint of demands of the political moment, from the standpoint of the political demands of the [Communist] Party at each given moment.”⁵ “A war can turn upside down each and every pact.”⁶ Here are the “political demands”: “History says that when any country wants to fight against another country, even one that it does not neighbor, it begins to seek out borders, through which it could reach the borders of the country it wants to attack,”⁷ Stalin wrote.

Stalin needed a situation in which “capitalists gnaw at each other like dogs.”⁸ The Molotov-Ribbentrop Pact created precisely that situation. *Pravda*’s tone was excited: “Each war like this one brings us closer to that happy period, when there will be no more killings among people.”⁹ Lieutenant General S. M. Krivoshein describes a conversation with his deputy, P. M. Latyshev (at that time Krivoshein commanded the 25th Motorized Corps): “We made a deal with the Germans, but this does not mean anything. . . . Now is the best time for a final and constructive resolution to all of the world’s problems.”¹⁰

Before the war, the main Communist Party newspaper, *Pravda*, did not call upon the Soviet people to build defenses. *Pravda*’s tone was different: soon the entire world will belong to us. “Our country is great. The globe itself needs to rotate nine hours in order for our huge Soviet country to enter the new year of its victories. There will be a time when it will need for this not nine hours, but a whole twenty-four. . . . And who knows where we will be greeting the New Year in five or ten years: along what time belt, on what new Soviet meridian?”¹¹ With the date of the Soviet break-in into Europe approaching, *Pravda* became more and more straightforward: “Divide your enemies, temporarily satisfy the demands of each of them, and then crush them one by one, without giving them an opportunity to unite.”¹²

Hitler decided that he should wait no longer. He made the first move without waiting for the blow in the back from the liberating axe. But even having started the war in the most favorable circumstances that had ever existed for an assailant, he was unable to win. Even in the most unfavorable of circumstances, the Red Army managed to “liberate” half of Europe and dominate Eastern Europe for half a century. One wonders what the outcome would have been if the best German forces had left the European continent to go to Africa and the British Isles, and, behind their back, the Red Army had destroyed the only German oil source in Romania?

Destruction of the Security Pale on the Eve of the War

Mines are powerful stuff, but they are a means for the weak, for those defending themselves. We are strong. We need mine-clearing measures rather than mines.

—G. I. KULIK, MARSHAL OF THE SOVIET UNION

To prevent a sudden enemy attack, a country preparing for defense deploys its troops not on the very border, but deeper in its territory. Between the border and the main line of defense, it creates a continuous zone of obstacles and barriers. This zone is called the security pale. Its purpose is to wear down the aggressor before he meets the main forces of the defense.

In the 1920s, during their attempt to occupy Poland, commanders of the Red Army saw the effectiveness of the Polish security pales for the defense of Poland and had the bitter experiences of advancing through such pales. That is why after the Polish war the special Soviet government commissions studied the western regions of their country and determined the most and the least penetrable zones. All bridges in the western regions of the country were prepared for explosion. Bridge patrols were ready to blow up the bridges at any moment. Aside from bridges, large pipelines, depots, water pumps, water towers, high mounds, and low gullies were all wired for explosion.¹ At the end of 1929, in the Kiev military district alone, sixty demolition squads, numbering 1,400 people, were trained and ready. They had at their disposal “1,640 fully ready charges and tens of thousands of incendiary pipes that could be put into action almost instantly!”² Such work was conducted in other military districts as well.

In addition to demolition experts’ squads, railroad-blocking battalions were formed in the western regions of the country. Their task included completely demolishing major railroad centers in the event of retreat, blocking the main routes, and installing powerful charges with delayed-action detonators in the event that the enemy attempted to restore the roads. Ukraine had four such battalions by 1932.³ On top of that, railroad switch transfers, communication equipment, telegraph systems, and in some cases railroad tracks, were all prepared for

evacuation. The Soviet security pale was constantly improving. The list of objects prepared for explosion or evacuation became longer. New obstacles and barricades were erected, new forest abatises were prepared, and artificial reservoirs were dug in front of defensive structures; areas of the region could be turned into swamps if necessary.

In September 1939 the border of the USSR was moved 200 to 300 km to the west. The depth of the security pale increased greatly. Moreover, the railroad system on the territories acquired after the division of Poland was poorly developed. Out of 6,696 km of tracks, only 2,008 were two-way, and even they had a low capacity. In case of emergency, it was very easy to make them completely unusable.

In November 1939, the Red Army in Finland learned the hard way that a security pale could ease the position of the defense and complicate the position of the aggressor. Crossing the Finnish security pale required a huge expenditure of time, strength, resources, and blood.

All Soviet commanders expressed their awe at the Finnish line of defense, and among them was K. A. Meretskov, Commander of the 7th Army during the war against Finland.⁴ After having surmounted the Finnish defense line and evaluated its qualities, Meretskov was appointed Chief of the General Staff. In accordance with his newly acquired experience, he should have reinforced the Soviet security pale. But he did exactly the opposite. Meretskov ordered the destruction of the security pale created earlier on the old western borders, the disbanding of the demolition experts' squads, the dismantling of the charges, the disarming of the mines, and the flattening out of all barricades. He also ordered his troops not to create a security pale on the Polish territory annexed to the Soviet Union in 1939; to lead the main forces of the Red Army to the edge of the borders (without protecting those forces with any kind of security pale); to move the bulk of the strategic supplies of the Red Army from the depths of the country to the western regions; to build air bases and roads in Western Belorussia and Western Ukraine; to transform one-track railroads into two-track ones (to raise their cargo-carrying capacity); and to build new roads leading straight to the German border.

Here are the results of that policy. In 1939, Poland was divided between Germany and the Soviet Union. Some rivers became borders. Bridges on those rivers that were not used were still kept intact. In the line held by the 4th Army alone, there were six such bridges.

The former Chief of Staff of the 4th Army, Colonel General L. M. Sandalov, asked: "Why, to ask frankly, were so many bridges across the Bug [river] kept intact in the line of the 4th Army?"⁵ The German command hoped to use the bridges in an aggressive war, and thus did not ask for their destruction. But what did the Soviet command hope for?

At the beginning of the war, a huge number of German troops went across those bridges, crushing the Soviet 4th Army in a surprise attack. The defeat of the 4th Army opened the way to the rear of the really powerful 10th Army, which also suffered unimaginable devastation. Without encountering any more barriers, Guderian's tanks headed straight for Minsk in Belarus. The German troops advanced without complications, taking bridges on the rivers Daugava, Berezina, Nieman, Pripiat, and Dnepr.

In January 1941, Stalin replaced Chief of General Staff K. A. Meretskov for not being sufficiently active in the construction of new roads, bridges, and air bases in the new regions. On February 1, 1941, General of the Army G. K. Zhukov replaced Meretskov as Chief of the General Staff. The work began at a truly Zhukov speed. Before 1941, the Red

Army had five railroad brigades. Zhukov immediately increased this number to thirteen, ten of them in the west of the country. Each brigade consisted of one regiment, two separate battalions, and supply units. Almost all railroad troops were concentrated in the western border regions and worked intensively to modernize old railroads and build new ones right up to the border.⁶ Some of the new railroad lines were: Proskurov—Ternopol—Lvov; Lvov—Iavorov—state border; Lvov—Peremyshl—state border; Timkovichi—Baranovichi; Belovezha—Oranchitsa—state border. The names of some of these stations demonstrated that the Soviet leadership regarded the border area as its own rear zone, where in the event of a quick advance to the west the Soviet army would have to deliver millions of men, millions of tons of ammunition, fuel, and other supplies.

Simultaneously with the construction of railroads, automobile roads were built in the western regions (for example, Orsha—Lepel, Lvov—Peremyshl, Belaya Tserkov—Kazatin, Minsk—Brest). What were those roads built for?

During preparations for a defensive war, roads parallel to the front line are laid down, so that reserves could be moved from passive areas of defense to dangerous areas. Those roads must not be near the border, but much deeper in the country, leaving the border regions as clear of roads and bridges as possible. But the Red Army was building roads and railroads from east to west, which was usually done when preparing for advance, for a quick transfer of reserves from the depths of the country to the borders, and for further supplying the troops after they crossed the borders. New roads led to border towns: Peremyshl, Brest, Iavorov. Zhukov remembered: “The web of automobile roads in Western Belorussia and Western Ukraine was in poor condition. Many bridges could not hold the weight of the medium tanks and artillery.”⁷ Zhukov should have rejoiced at that fact. He should have commanded his men to covertly weaken the support beams on those bridges and thus lure the attacking enemy to send his tanks to those weakened bridges, to their sure demise. Instead, he built roads and replaced old bridges with new ones, so that any tank and any artillery could pass through.

The official *History of the Kiev Military District* stated: “In early 1941, Hitler’s forces began to build bridges, railroads, and field air bases.”⁸ Obviously, these were signs of preparations for attack. The Soviet railroad forces were doing exactly the same: “Railroad troops in Western Ukraine worked to develop and strengthen the railroads.”⁹ Railroad brigades, created by Zhukov’s order, completed a tremendous amount of work on the Soviet territory, but their main job was planned to be on enemy territory: they had to follow the advancing army and quickly get through the enemy’s security pale, repair enemy roads and bridges, and change the European narrow gauge to the broad Soviet standard one. Right on the borders, they piled huge reserves of railroad tracks, demountable bridges, construction materials, and coal.

In addition to the ten railroad brigades in the western regions, almost all the Soviet engineering troops were concentrated along the western borders. Various construction units and squads were active before the war in the border strip. The task was to prepare the “initial points for attack, [the] foundation of passageways for columns, . . . operational and tactical camouflage, organization of joint action in the storming groups with infantry and tanks; [and] to provide the equipment for crossing rivers.”¹⁰

On the eve of the war, the USSR launched a gigantic campaign to modernize and widen its road network in the western regions. All that work harmed the USSR very soon.

Hitler used the roads, bridges, stocks of coal, rails, and the sectional bridges that the Soviet leadership prepared in the western regions of its country.

As we know, all that did not help the invading German army: its advance was not as fast as planned. But even this advance could have been stopped if Zhukov had not built roads on the eve of the war, had not created huge reserves of railroad tracks, bridges, and construction materials. He should have introduced an effective system of defense: all bridges should have been blown up, all materiel reserves liquidated, railroads and trains evacuated, roads destroyed, drowned, turned into swamps and saturated with mines.

On Soviet territory, all mines were disarmed and the barriers taken down. On the eve of the German invasion, General of the Army D. Pavlov, a commander of the Western Special Military District (then already secretly transformed into the Western Front), said that the Soviet sappers were not paying enough attention to preparing themselves properly for removing mines and other obstacles on enemy territory.

If the Soviet marshals had known better, they would have started their war on June 21: then they would not have needed to take down German obstacles, because the German army was doing on the German territory exactly what the Red Army was doing on Soviet territory. In early June, German troops were disarming mines, evening out barricades, and concentrating troops right on the border, without keeping in front of them any security pale.

Soviet Marshal K. S. Moskalenko, who in 1941 commanded the First Artillery Anti-Tank Brigade, counted those German actions as an unquestionable piece of evidence that the Germans would attack soon.¹¹ At the same time, the NKVD border troops were dismantling their own barbwire on the very border to clear the way into enemy territory for the “liberation” army. They had cut barbwire in exactly the same way before the “liberation” of Poland, Finland, Estonia, Latvia, Bessarabia, and Northern Bukovina. Now it was Germany’s turn.

Partisans or Saboteurs?

Leninism dictates that a socialist country, using the favorable world situation, must take on the initiative of making military advances against the capitalist surroundings with the purpose of widening the socialist front. . . . Leninism's motto, "defend your land on foreign soil," can at any moment turn into practical action."

—DIRECTIVE OF THE MAIN POLITICAL DIRECTORATE OF THE
RED ARMY, JUNE 3, 1941.

Through partisan actions, one can fight against even the strongest enemy. The aggressor can take over the country in a matter of days, but then for years wage an exhausting war against partisan groups. History abounds with examples of small and poorly armed partisan units eventually defeating powerful armies.

The Red Army had a vast experience fighting against partisans. Commanders of the Red Army knew how difficult and costly partisan warfare could be. During the Russian civil war, the population of the former Russian Empire resisted the Communists mostly through partisan methods. An entire partisan army under the leadership of Nestor Makhno was active in southern Ukraine. In the Tambov province, after the civil war, the Communists waged a real war against the partisan army of Alexander Antonov. In Siberia and in the northern Caucasus, war against partisans continued until the mid-1920s and in Central Asia until the beginning of the 1930s.

Soviet leaders knew that partisan tactics would win the war against any aggressor. The Soviet Union has the largest territory of any country in the world. That territory naturally facilitated partisan warfare. Did Stalin create light mobile units and station them in the woods in the event of a German attack? Yes, Stalin created such units. They were created back in the 1920s. In Belorussia alone, during peacetime there were six partisan units, numbering three hundred to five hundred men each. One should not be confused by the seemingly small numbers. The units were comprised only of commanders, organizers, and specialists. Each peacetime partisan unit was a nucleus, around which at the very beginning of the war developed a powerful formation numbering in the thousands.

Secret bases for peacetime partisan groups were created in impenetrable forests and islets amid the swamps. During peacetime, subterranean shelters, hospitals, storages, and workshops for the production of weapons and ammunition were built. In peacetime, only Belorussian secret subterranean storages held ammunition, weapons, and supplies for fifty thousand partisans. Secret schools were formed for preparing partisan leaders, organizers, and instructors. Secret research and development centers worked on creating special means of warfare, arms, communication channels, and equipment. Partisans were often subjected to training and tests, with divisions of the NKVD often playing the role of the enemy. In addition, small groups were prepared for undercover activities. These groups, in case of aggression, did not retreat to the forests, but stayed in the cities and towns, with the task of “gaining the trust of the enemy” and “offering him assistance.”

That sort of work was conducted not only in Belorussia, but also in Ukraine, in the Crimea, in the Leningrad region, and other areas. The same duties were simultaneously, but totally independently from the NKVD, performed by the Soviet Military Intelligence: it set up secret bases, apartments, and hiding places, and prepared lines of communication for conspirators. Soviet Military Intelligence had its own secret schools, its own organizers, and its own instructors. Aside from the NKVD and the military intelligence, the Communist Party prepared some of its leaders in the western regions of the country for transfer to an underground position in the event of a territory takeover by the enemy.

The partisan units were formed in the so-called “death zone”—the Soviet security pale, where during retreat of Soviet troops all bridges should be blown up, tunnels buried, railroads destroyed, and telephone cables and other communication channels evacuated. The partisans had to prevent the enemy from restoring the destroyed infrastructure. The partisans were almost undefeatable—their leaders knew safe passages, which the enemy did not know, through the giant minefields; in an emergency, the partisans could easily disappear from any pursuers into the mined forests and swamps, which were impassable to the enemy.

The security pale and partisan groups, ready at any minute to act in a zone of destruction, were the great defenses of the Soviet Union. However, in the second half of the 1930s, as the country’s industrial and military might grew, the Soviet Union tended to fight enemies on their soil rather than protect Soviet land. From that period, defense systems became unnecessary. “Whole caches of weaponry, ammunition, [and] explosives, intended for partisan forces and kept hidden, were liquidated. The network of partisan training schools, along with their very competent leaders, was eliminated. Partisan battle groups were disbanded. Only the few partisan leaders who confronted the fascists in Spain kept their places. Among them were A. K. Sprogis, S. A. Vaupshassov, N. A. Prokopyuk, I. G. Starinov, and others.”¹

On November 30, 1939, the Red Army began the “liberation” of Finland, and hit up against the same elements of self-defense that had earlier existed in the Soviet Union: a line of concrete fortifications, a security pale before it, and light squads of partisan fighters within. The light ski units of Finnish partisans carried out sudden strikes and then immediately disappeared into the forests. The Red Army suffered tremendous casualties from those strikes, and all its modern technology was useless in the fight against an enemy that evaded open battle. Perhaps, having learned a cruel lesson in Finland, Stalin changed his mind and once again created partisan formations in the western regions of the Soviet Union? No, he did not.

One of the fathers of Soviet military terrorism, GRU colonel and professor I. G. Starinov, between 1930 and 1933 headed the secret school that prepared partisan groups which were subordinate to the Soviet Military Intelligence. The colonel wrote in his memoirs: "Safely hidden underground, the weapons and explosives awaited their hour. But before this hour could come, the covert partisan bases were emptied, unquestionably with the knowledge of, and, probably, under direct orders from Stalin."²

During the war, P. K. Ponomarenko was Chief of the Main Staff of the Partisan Movement. After the war, he voiced his anguish and frustration: "Stalin's incorrectly aimed statements that, if attacked, we would fight only on enemy territory led to the complete dismantling of all efforts to harness the experience from previous partisan wars and to develop corresponding mobilization directions. As a result, the initial phase of the war was marked by a particularly difficult effort to organize the partisan movement. The Party had to pay dearly for Stalin's mistakes."³

Colonel of the KGB S. A. Vaushpass⁴ spent the 1930s training Soviet partisans in case of enemy aggression and occupation. He explained the reason for the disbanding of the partisan formations on Soviet territory: "During those threatening pre-war years, a doctrine arose about war on foreign soil . . . it had [a] very clearly expressed aggressive character."⁵

We can agree with these statements or we can dispute them. But so far, no other reason for the destruction of the partisan movement has been put forward.

Destruction of the Stalin Line

Only naïve people think that defense is the main task of fortified regions. No, fortified regions are built for a more reliable preparation for advance. They must reliably cover the reserves of attacking groups, deflect any enemy attempt to curb the unfolding of attack, and with the transition of our troops to advance, offer them full fire cover.

—MAJOR GENERAL P. G. GRIGORENKO,
YOU ONLY MEET RATS IN THE UNDERGROUND

From 1926 to 1937, thirteen fortified regions were constructed along the western borders of the USSR. That chain of fortifications was unofficially known as “the Stalin Line.”

A fortified region (FR) was an area prepared for defense; at the same time, it was also a military formation, equal to a regiment or a brigade in number but equal to a corps in firepower. Each FR had a command and staff, from two to eight machine-gun and artillery battalions, an artillery regiment, several separate heavy artillery batteries, a tank battalion, a communications battalion, an engineering-sapper battalion and other formations. Each FR occupied an area from 100 to 180 km long and 30 to 50 km deep. The region was equipped with a complex system of concrete and armored military and supply buildings, mostly subterranean. Within the FR, there were underground concrete storage units, electricity stations, hospitals, command centers, and communication quarters. The underground constructions were connected through a sophisticated system of tunnels, galleries, and covered passageways. There was also an intricate web of railroads for bringing in materials, maneuvering armored trains, and quickly transferring reserves to the troops. Each FR could independently conduct military operations during a long period of time and in isolated conditions.

The fortified regions were built by the distinguished fortification expert of the twentieth century, Professor Dmitriy Karbyshev. In 1940, he was awarded the rank of lieutenant general of engineering troops. Simultaneously with the developments on the western frontiers, Karbyshev’s projects also encompassed construction of fortified regions in the Far East and in

the Trans-Baikal region. Those field strongholds are still in use today, in the twenty-first century. In 1990, the Soviet military newspaper *Krasnaya Zvezda* described one of the active military buildings: “This is mono-concrete. Solid cast. The depth of the walls is up to one and a half meters. For half a century, they have been there, but even today not a single shell could take them. . . . Roofs of casemates have a low-profile. Ammunition. Command. Diesel engines. Batteries. Filters. An automatic heating system. . . . In this shell, filled with instruments and arms, one feels as if [one is] in a giant buried tank or a submarine hidden underground.”¹

Each FR consisted of “pillboxes,” each equipped with its own defenses and each capable of independently defending itself if fully encircled by the enemy, diverting to itself significant enemy forces and attention. The main fighting unit of the fortified region was the LFP—long-duration firing point. *Krasnaya Zvezda* described one of the standard LFPs from the Stalin Line, the LFP #112 of the Mogilyov-Podolsk FR, as follows: “This was a complicated fortified underground structure, consisting of communication passages, caponiers, and compartments. In there, one could find arms, ammunition, foodstuffs, a mess hall, running water (by the way, still in working condition), a ‘red corner,’ [and] observation and command posts.”² The LFPs are armed with a machine-gun post of three embrasures in which, on stationary rollers, were three ‘Maxim’ machine guns and two half-canopies with 76-mm cannon in each.”³ Such an LFP can be considered average. There were also thousands of small, armed constructions with one or two machine guns, as well as giant fortified ensembles.

Major General P. G. Grigorenko, a participant in the construction of the Stalin Line, described in his memoirs one of the field strongholds built in the similar Mogilyov-Podolsk FR: “Nine firing points, connected by underground passageways, were on the high shores of the Dnestr and kept the river and the opposite shore under dense gun and machine-gun fire.”⁴ Another participant in the construction of the Stalin Line, Colonel R. G. Umanskyi, wrote of multi-kilometer underground structures in the Kiev fortified region.⁵ Yet another participant, Colonel General A. I. Shebunin, said that many concrete defensive structures in the Proskurov fortified region were protected by artificial water barriers. In this FR was raised “a mighty line of defense, which counted more than a thousand various military field strongholds. Many objects were so thoroughly masked that even from close up it was difficult to guess their real designation.”⁶

Construction of the Stalin Line was not publicized like the construction of the French Maginot Line. The Stalin Line was built in secrecy. During the construction of each field stronghold, NKVD units put cordons around several areas. The construction went on simultaneously in all areas, but it was the real thing only in one—the rest were decoys. Not only the local population but also the construction workers had a very vague understanding of what was being built and where.

There were many differences between the Soviet Stalin Line and the French Maginot Line. The Stalin Line could not be bypassed: its flanks went right to the Baltic Sea in the north and the Black Sea in the south. The Stalin Line was built not only to stop infantry, but mostly to stop tanks. The Stalin Line was much deeper. Aside from concrete, the Soviets also used huge quantities of steel, and granite boulders.

Unlike the Maginot Line, the Stalin Line wasn’t built at the very border, but deeper into Soviet territory. A line of fortified regions in the depth of the country means that the first enemy artillery strike will be carried out against an empty space rather than the defending army. Therefore, during a surprise attack, defending garrisons have a minimum of several days to take their places in the casemates and prepare their arms and defense. If the fortified

regions are in the depth of the country, the enemy, before beginning the storming, must cover from 20 or 30 to 100 or 150 km of territory saturated with minefields and other unpleasant surprises. The aggressor will have to cross many rivers and streams whose bridges have been destroyed. Before the storming, enemy troops will already have suffered significant casualties in the hundreds of ambushes along the way.

The security pale before the Stalin Line not only reduced the speed of the enemy and wore out his strength, but it also served as a fog over the sea, behind which hid a row of icebergs. Not knowing the exact location of the field strongholds of the Stalin Line, the enemy could unexpectedly find himself right in front of Soviet armed structures and in the midst of their deadly fire. The location of the Stalin Line deep in Soviet territory, behind the security pale, produced the opportunity to counter the surprise element of attack with a surprise element of defense. The fortified regions were masked and hidden in such a way that in most cases a clash between the aggressor and Stalin's army would be unexpected for the aggressor.

Unlike the Maginot Line, the Stalin Line was not continuous. Rather wide passageways were left between the fortified regions. In an emergency, the passages could quickly be closed with land mines, barricades, or field defense by regular troops. Or the passages could stay open, offering the aggressor the option to not storm the fortifications head on, but to squeeze between them instead. If the enemy attempted the latter, most of his advancing troops would be crushed in several isolated columns. Each column had to advance through a corridor shelled from all sides, with its flanks, rear, and communication lines under constant and serious threat.

The thirteen fortified regions on the Stalin Line came at a tremendous cost in effort and money. In 1938 it was decided to strengthen all thirteen regions by building within them heavy artillery installations. The construction of eight more regions started. In one year, the new fortified regions counted 1,028 armed field strongholds.

Then, the Molotov-Ribbentrop Pact was signed. The pact created a common border between Germany and the USSR. In such a threatening atmosphere, Stalin could have done any number of things to increase the safety of the western Soviet borders and guarantee the USSR's neutrality in the war. Instead, in the fall of 1939, at the beginning of World War II, he ordered further construction of fortified regions to stop.⁷ Garrisons in fortified regions on the Stalin Line were the first to be cut back in numbers, and then completely disbanded. Soviet factories lowered the output of arms and special materials for field stronghold structures. The existing fortified regions were disarmed; their ammunition, weapons, observation instruments, and communication lines were put in storage.⁸ Some buildings were given to the farming associations for use as crop silos. Most were just buried in soil.

In addition to lowering the production of arms for fortified regions, Soviet industry, after the start of World War II, stopped producing other defense weapons. For example, the production of anti-tank cannon stopped completely, as well as the 76-mm division cannon, which could be used against tanks.⁹ Anti-tank rifles were taken out of production and out of the supply of the Red Army. They were taken away from all formations and put in storage.¹⁰ Everything connected with defense was mercilessly dismantled and destroyed. At the same time, the Red Army was fighting in Finland, where Stalin and his marshals saw that fortified regions and security pales had tremendous value for defense.

To be fair, during the summer of 1940, the construction of a line of fortified regions began right on the new Soviet-German border. However, the new line was never finished. In

the General Staff of the Red Army, these regions were unofficially (and with a dose of irony) referred to as the Molotov Line. It had the same “father”: Professor Karbyshev. The decision to construct it came on June 26, 1940.¹¹ But the defense buildup on the new borders proceeded very slowly, while the destruction on the old borders was surprisingly fast. In the summer of 1941, the tragedy of the Stalin Line reached its climax. Wrote General Grigorenko:

I do not know how future historians will explain this crime against our people. . . . The present ones bypass this occurrence with complete silence, and I myself do not know how to explain it. Many billions of rubles (according to my calculations, more than 120) were taken by the Soviet government from the people to build impassable barriers on the border, from sea to sea, from the grey Baltic to the blue Black Sea. And on the eve of the war, the spring of 1941, loud explosions boomed across the 1,200 km of fortifications. The formidable concrete structures, triple, double, and single embrasure firing points, command and observation points—tens of thousands of long-term defense structures were blown up according to a personal order from Stalin.¹²

The Stalin Line on the old border was already destroyed, while the Molotov Line on the new border was not yet built. Soviet generals and marshals, after Stalin’s death, unanimously expressed their anger. Here are the words of Chief Marshal of Artillery N. N. Voronov: “How could our leadership, without building the necessary defenses on the new western borders of 1939, decide to liquidate and disarm the fortified regions on the old borders?”¹³ In addition, as Marshal M. V. Zakharov declared, it was decided to severely limit or even stop the production of all FR-type weaponry.¹⁴

This is a “red herring” argument used by pro-Communist historians to distract us. They want us to bemoan the folly of breaking the old fortifications line before the new one was ready. But the relevant question is: why break the old one at all? Two lines surely provide better defense than one.

Another pretext is that old fortifications were destroyed in order to move their weapons to the new ones. This is just another set of fallacies. Firstly, the weapons could have been left in the old line, and there had been enough time to order the Soviet industry to supply FR-type weaponry for the new line. But we know that the production of this type of weaponry was reduced immensely in favor of offensive-type arms.

Secondly, one does not demolish his old house just to move the furniture to the new one, unless the old house is not needed. With weapons in the fortifications it is exactly the same.

Thirdly, pro-Communist historians hope that we do not remember the chronology of the events: Stalin started to demolish the old line in September 1939, and decided to build the new one only on June 26, 1940. They want us to believe that the cause came after its consequence.

The dates demonstrate that there was no connection between those two events, except for the fact that the Stalin Line was built for a defensive war and the Molotov Line was built for an aggressive war against Germany, as we shall show further on.

In comparison with the Stalin Line, the Molotov Line was a thin chain of rather light field strongholds that did not require much armament. For example, in the western special military district in Belorussia, there were 193 field strongholds built near the new border. The old one had 876 much more powerful ones. In other military districts, the ratios between the

newly built constructions and those destroyed earlier were even more astonishing.

The Molotov Line drastically differed from the Stalin Line in design and in detail. There were four main differences between the field strongholds torn down near the old borders and those created near the new ones: the Molotov Line was built so that the enemy could see it; it was built on secondary locations; it was not covered by a security pale, minefields, or other engineered obstacles; and the builders did not use many opportunities available to them to fortify the line, and did not rush to complete their work.

For example, such a secondary location was in the Brest area. There the border river was crossed at once by six railroad and automotive bridges. The main strategic direction of attack of the Germans was Warsaw-Brest-Minsk-Smolensk-Moscow. That's why the bridges of Brest had huge strategic value. But the new fortified region was built 27 km north of Brest where there were no bridges! The fortified regions of the Molotov Line were pushed to the very edge of the border. They were not covered by a security pale, and in case of sudden attack, the garrisons had no time to take firing positions and prepare their arms.¹⁵

Unlike the Stalin Line, the fortified regions of the Molotov Line had very little depth. All that could be built on the very edge of the border was built there. According to Lieutenant General V. F. Zotov, rear defenses were neither built nor planned.¹⁶ New fortifications weren't built on locations tactically valuable for defense, but along the state border, following its twists and bends. New military buildings were not defended by barbwire fences, mines, trenches, or tetrahedrons. There were no engineered obstacles in the construction area. The new constructions were not camouflaged.¹⁷

At the same time, the German generals were doing the same. Between 1932 and 1937, mighty field strongholds were built on the shores of the Oder River, shielding Germany from strikes from the east. These were first-rate military structures, blended with the landscape and brilliantly camouflaged. I will not describe them in detail, but they are a formidable example of the German preciseness, accuracy, and industriousness. Fortified regions in the area between the Oder and the Warta rivers could serve as examples of the highest achievement of military engineering of the early twentieth century.

As soon as the Molotov-Ribbentrop Pact was signed in Moscow and the German army invaded Poland, the magnificent field strongholds near the old German border were abandoned and never again occupied by armies. Many field constructions were used for other purposes. For example, in the Hochwald region there was a powerful fortification ensemble, which included twenty-three four-story military constructions, connected by 30 km of underground tunnels. It was transformed into a factory for airplane motors. Having advanced and met with the Red Army in mid-Poland, the German troops began constructing a new line of fortified regions. They were built on secondary locations and pushed right up to the Soviet borders. In front of the new fortified regions, there were no minefields and no obstacles. The Germans worked night and day, and the Soviet border patrol saw that very clearly.¹⁸

German construction continued until May 1941, after which, to use Soviet language, "construction was rated as a second-class priority." Out of eighty military constructions planned to be built on the border river San, only seventeen were completed. They were all insufficiently camouflaged. Each of these constructions could be described as light compared to those on the old German-Polish border: relatively thin walls, and steel armor plates of just 100 mm. On the old borders, along the Oder line, they had used much stronger armor plates of up to 350 mm. Soviet officers later saw both German and Soviet LFPs on both sides of the

same river. If one showed photos of the LFPs to an expert and asked him to distinguish the German from the Soviet, he would be stumped. They were identical twins: when building the Molotov Line on the shores of the same river San, Soviet engineers also used relatively thin armor plates of 100 mm.

While their neighbor was weak Poland, German troops erected on their borders powerful fortifications; as soon as they crushed Poland and established a common border with the Soviet Union, the Germans abandoned the old fortifications, and built along the new borders, very slowly, only light defense structures. Just like the Red Army! That was because both sides did not plan to defend their new borders for long.

Fortification can be both defensive and offensive. If you are planning to attack, then you follow these rules during the construction of fortified regions:

- Gather attack groups of troops in the primary locations, leave secondary locations almost without troops and protect them with real fortified regions.
- In the primary locations, do not try to camouflage your fortifications; let the enemy think that you are preparing for defense.
- Everything that can be located right on the shores of border rivers should be located there: during your troops' advance across the river, these fortifications, placed right on the border, will support your advance with fire.
- Do not protect frontline fortifications with minefields and barbwire—they would hinder your own advancing troops.
- Do not waste a lot of cement and steel for frontline fortifications—you are not planning to sit in defensive positions for long.
- Do not build fortifications deep in your territory—they will be unnecessary.

These rules governed the actions of the Soviet and German generals from 1939. In August 1939, Zhukov brilliantly used these rules in Khalkhin-Gol: "With these actions, we strove to make the enemy believe in the absence of any sort of preparations for advance from our side, and to show that we [were] conducting widespread defensive works, and only for defense."¹⁹ The Japanese believed in Zhukov's "defensive" works and paid dearly for their folly. Later, on a much grander scale, Zhukov staged the same deception on the German border.

However, he did not fool the German generals. They had their own identical experience with Poland. On August 22, 1939, during the negotiations of the Molotov-Ribbentrop Pact and preparations of the German army to invade Poland, General Guderian received an order to command the "fortification team of Pomerania." The goal was to calm the Poles by showing them strictly defensive preparations, while raising, with minimal effort, light fortifications.

In the spring and summer of 1941, Guderian again was building defenses, this time on the Soviet border. If Guderian built light concrete boxes near the border, it did not at all follow that he intended to defend himself. It meant exactly the opposite. And if Zhukov built identical boxes along the same borders, what did that mean?

The Stalin Line was universal: it could be used either for defense or for attack—the wide passages between the fortified regions were left intact to let through masses of troops advancing west. When the border was moved a few hundred kilometers west, the Stalin Line completely lost its use as a fortified launching ground for attack, and Stalin did not need it

for defense after he signed the Molotov-Ribbentrop Pact. As a result, the Stalin Line was disarmed and then dismantled: Stalin was not planning to fight on his territory. After Germany got bogged down in a war against Great Britain, Stalin no longer needed the fortified regions in the depths of Soviet territory.

Hitler faced the same situation, not only on his eastern borders but on the western ones as well. There, in the 1930s, he built the Siegfried Line. Traditionally, since the times of the Franco-Prussian War, a German attack on France was always planned in the north. The Siegfried Line was built to the south of that direction—in other words, on a secondary location—following the principle of attacking the primary and fortifying the secondary location. In 1940, the German army advanced far west, and the Siegfried Line became useless. At that time, Hitler had no idea that in four years he would have to defend his own borders again. The Siegfried Line was abandoned. Its new use was quite unusual—the military constructions were given to farmers for storing potatoes. Some of the military structures had their unbreakable armored doors locked from within; when someone wanted to get in, the keys were nowhere to be found.²⁰

We could, of course, call outstanding Soviet and German generals idiots. But stupidity is not the explanation here. Simply put, both sides were aggressors. Both were thinking in terms of attack, and when fortifications could no longer be used for invasion, they tore them down or put them to whatever use they saw fit.

Trotsky Murdered, Molotov in Berlin

Hitler will send his main forces west, and Moscow will want to use the advantages of her position.

—L. TROTSKY, JUNE 21, 1939

On August 21, 1940, in Mexico, Leon Trotsky was gruesomely murdered. An agent of the NKVD, Spanish Communist Ramon Mercader (also known as “Jacques Mornar Vandenrein” and “Ramon Ivanovich Lopez”) posed as an idealistic Trotskyite and penetrated Trotsky’s inner circle. Trotsky liked the essays Mercader wrote and the pleasant young admirer became a fixture at Trotsky’s home. On the day of the murder, the two of them were alone in Trotsky’s office. Trotsky was bent over his desk reading an article by Mercader when his guest pulled out an ice-pick from inside his trench coat and crushed Trotsky’s skull with a monstrous blow.

Mercader was arrested at the scene of the crime; but he refused to testify. The Mexican court sentenced him to twenty years in prison. On May 6, 1960, three months short of completing his term, he was released for good behavior. Mercader returned to the USSR and was awarded the title of Hero of the Soviet Union with the “Golden Star,” and the highest governmental award, the Order of Lenin. He was given a position as a researcher at the Marxism-Leninism Institute of the Central Committee of the Soviet Union Communist Party. At that time, people joked that, after becoming a staff fellow at such a respectable academic institution, Mercader was writing a multi-volume dissertation on the topic of “Alternative Uses for Ice-Picks.”

Some said that Trotsky’s murder had no meaning, that Trotsky had few followers, lived in remote Mexico, and posed no threat. It was said that the murder was Stalin’s personal vendetta and a manifestation of his paranoia. But some ambiguities remained. Why was Trotsky in Mexico in the first place?

Trotsky reached the peak of his career in October 1917. Under his leadership, the Bolsheviks engineered the state coup and the takeover of Petrograd (St. Petersburg), the

former Russian capital. Trotsky was effectively the founder and leader of the Red Army during the entire Civil War. However, already during the Civil War, he was not the most important man. He shared the top powers with Lenin. Gradually, Trotsky was relegated to secondary roles. His slide from the top accelerated and turned into a rapid fall. By 1923, Trotsky was the head of a leftist opposition within the Communist party, meaning that he was in the minority. By 1927, Trotsky was ousted from all his posts and deprived of all duties and privileges. On November 7, 1927, Trotsky tried to give a speech in front of a column of demonstrators headed for Red Square, but he was pelted with empty bottles and stones. Killing Trotsky was not a challenge. There would have been plenty of volunteers. Why didn't Stalin kill Trotsky then?

In early 1928, Stalin exiled Trotsky to Kazakhstan. A year later, he sent Trotsky to Turkey. Again, we ask: what for? In Kazakhstan, Trotsky was completely isolated and fully monitored by Stalin's secret police. The Soviet Union's borders were hermetically sealed, and running out of the country was extremely difficult. For Trotsky, it would have been completely impossible, since he was under constant surveillance. He could not run away from Stalin. He did not even exhibit any desire to do so. As a political opponent, Trotsky was completely disarmed. He had no power strings, no influence, no money, and no means of communication. No one published anything he wrote. His letters were checked, detained for several months, and in most cases simply disappeared. Trotsky's followers were harshly persecuted. Monstrous beatings of Trotskyites in dark alleys were just the earliest and most modest manifestations of Stalin's aversion. Later on, there were exiles, prisons, torture, public trials, and executions. Millions disassociated themselves from Trotsky. Only a few individuals remained true to him.

Human nature is such that people befriend those who are rich and powerful, but when someone falls from the top to the bottom of the power ladder, the number of his friends and supporters falls drastically. Suddenly volunteers appear to kick yesterday's boss. Stalin exterminated millions whom he considered to be his enemies or potential enemies. Stalin sent his opponents to Siberia, to the Far East, to Kazakhstan, to Sakhalin and Kolyma, or directly to the execution cellars. Only one enemy, Trotsky, the most significant one, Stalin brought out of Kazakhstan and sent to the heavenly islands in Turkey's Sea of Marmara.

If Trotsky had been dangerous, Stalin could have isolated him the same way he isolated Lenin in the last years of his life.¹ Trotsky could have perished on the operating table, like Michael Frunze, who replaced Trotsky as the leader of the Red Army, in 1925. Trotsky could have drowned in a lake, like Efraim Skliansky, Trotsky's deputy commander of the Red Army during the Civil War, in 1925.

Stalin, at that time, had three secretaries: Bazhanov for "daylight operations," Mekhlis for "twilight" ones, and Grigoryi Kanner for "dark" operations. Bazhanov remembered that Michael Frunze had to be placed on the operating table by force; that was how much Stalin cared for the health of his buddy. Frunze was right to put up a fight. Death awaited him on the operating table. He must have guessed this. The arrangements for the operation were handled by Kanner. When the secretary for "daylight operations" Bazhanov heard about this, everything was clear to him.² Bazhanov described how he received news of Skliansky's puzzling death: "Mekhlis and I immediately went to Kanner and unanimously said: 'Grisha, it is you who drowned Skliansky.' Mekhlis and I were completely certain that Skliansky was

drowned on Stalin's orders, and the "accident" was organized by Kanner and Iagoda."³ By the way, Kanner was executed by a firing squad in 1937, Iagoda in 1938.

In Kazakhstan, Trotsky could not publish anything. By letting Trotsky go free, Stalin gave him the opportunity to say and write anything he wanted, including the most horrible things about Stalin. Why did Stalin postpone Trotsky's murder for so long? In the 1930s, Stalin accused all his enemies in the country of being Trotskyites. Trotskyites and those who were branded Trotskyites were executed by the thousands or sent to the camps by the thousands. Meanwhile, Trotsky himself was free. He lived on islands of fantastic beauty in Turkey, then in the south of France, in Norway, and finally in Mexico. Then, all of a sudden, the hunt for Trotsky began. There were several assassination attempts until the successful blow with the ice-pick.

Did Stalin's paranoia increase? No. On the eve and at the very beginning of World War II, Trotsky presented a clear and imminent danger not only to Stalin, but to the entire Soviet leadership. Trotsky fanatically supported the World Revolution. Once he realized that it had failed in Germany and throughout the world he warned that Soviet Russia could not survive encircled by capitalist states. The only hope was to turn Soviet Russia into a military camp and use its forces to aid revolutions whenever and wherever an opportunity appeared. Stalin insisted that Trotsky was wrong and the Soviet Union first had to build "Socialism in One Country." The Soviet Union would not export revolution. Then Stalin took more radical measures than Trotsky had proposed to turn the Soviet Union into a military camp. He carried out forced collectivization and industrialization, and built the GULAG camps for forced labor. Under Stalin the Soviet Union became an industrial power and the military base for World Revolution. Summing up, Trotsky loudly called for the World Communist Revolution. Stalin acted to achieve the same goal, but said that Trotsky's slogans were wrong.

Stalin's rhetoric was successful and duped Trotsky, who thought he was exposing Stalin when he declared to the world that Stalin had betrayed the cause of Communism and World Revolution. Trotsky did not understand that criticism was necessary for Stalin and was part of his plan. With his accusations, Trotsky dulled the fears of the West that Stalin would pursue World Revolution. Trotsky claimed that there was no reason to fear Stalin, that Stalin was "the greatest mediocrity in power," and that his regime would implode from within. "Stalin's personal dictatorship clearly nears its sunset," Trotsky said in November 1931.⁴ Thus, with Trotsky's dubious endorsement, the West helped Stalin to create a powerful military industry, and to prepare his country and army to crush Western civilization.

Trotsky's opinion had credibility for Western politicians; after all, he had played a key role in the revolution, the Civil War, and the establishment of the Red Army. Trotsky launched the World Revolution, but he lost power. Stalin, if one believed Trotsky, was not instigating revolution but building socialism in one country, the Soviet Union. Stalin let Trotsky leave the Soviet Union and provided him with publicity around the world. Contact with Trotsky was a standard accusation against so called "enemies of the people" at every political trial in Moscow. Stalin could have called his enemies any number of names, but he stubbornly called them Trotskyites, giving Trotsky additional political weight. If Trotsky had asserted the opposite, if he had said that Stalin was preparing for aggression, if he had warned the West of the dangers of Stalin's malice, he would have been murdered as early as 1927.

Gradually, Trotsky sensed Stalin's true intentions. He stopped writing that Stalin had betrayed the cause of the World Revolution and started writing that Hitler had come to

power with Stalin's help. "Without Stalin, there would be no Hitler," said Trotsky. "Hitler was preparing for war. . . . The strike against the West in the near or far future could only be realized in the conditions of a military alliance between Fascist Germany and Stalin."⁵

On September 4, 1939, Trotsky reminded the world that "the Kremlin had fed oil to the Italian campaign into Abyssinia," and now it fed oil to Hitler's war against Europe. Trotsky asked why the pact of non-aggression between the Soviet Union and Germany had turned into war. "Is it unclear why Hitler began the advance on Poland immediately after the embraces between Ribbentrop and Molotov? Stalin knew very well what he was doing. For an attack against Poland and a war against England and France, Hitler needed favorable "neutrality" from the USSR, plus Soviet raw materials. The political and economic agreement provides Hitler with one and the other."⁶

At that point Trotsky stopped being useful to Stalin, and Stalin decided to get rid of him. Moreover, Trotsky had become dangerous. He warned Great Britain and France that the root of all evil was not Hitler, but Stalin. Without Stalin's "neutrality" toward Hitler, without Soviet petroleum, chrome, tin, nickel, platinum, iron ore, cotton, grain, manganese, copper, vanadium, molybdenum, and tungsten, Hitler could not have unleashed the war in Europe. But Trotsky warned Hitler as well. Back in June 1939, when very few people in the world had any idea that in a couple of months World War II would start, Trotsky exhibited amazing foresight when he wrote: "Hitler is going to strike to the west with his main forces and Moscow will be eager to fully take advantage of the situation."

Trotsky's predictions began to come true. In May 1940, Hitler invaded Belgium, the Netherlands, and France, and Stalin fully exploited the situation. On November 12, 1940, Soviet foreign minister Molotov arrived in Berlin and presented to Hitler a long list of territorial claims on behalf of the Soviet Union. These demands were repeated on November 25, 1940, when the Soviet Union proposed a peace pact between Germany, Italy, Japan, and the USSR. The Soviet Union demanded:

- from Finland: Pechenga, the only Finnish port on the Barents Sea, and Porkkala-Udd, the strategically located peninsula on the Baltic Sea controlling the entrance to the Gulf of Finland;
- naval bases on the Danish side of the straits of Kattegat and Skagerrak, controlling access to the North Sea and to the Baltic Sea;
- from Yugoslavia: a naval base on the Adriatic Sea;
- from Greece: a naval base in the Greek port of Thessaloniki;
- from Romania: the province of Southern Bukovina, a strategic foothold in the Carpathian Mountains to control access to the Ploesti oil fields;
- from Bulgaria: a pact of alliance with the Soviet Union including Bulgaria in the Soviet sphere of influence;
- from Turkey: bases in the Bosphorus and Dardanelles straits;
- from Iran: bases in the Persian Gulf;
- the transfer of territories south of the Baku-Batumi line (in eastern Turkey, north of Iraq and Iran) to the Soviet sphere of influence;
- from Japan: the renunciation of its oil concessions in the province of Northern Sakhalin.

Hitler and his officials were dumbfounded by such extraordinary demands and did not respond.

On November 13, 1940, Molotov asked Stalin for instructions “about China, Turkey, and our interests regarding the Persian Gulf and the Arabian Sea.”⁷ Stalin advised Molotov: “Do not expose our interest in Persia. . . . If the Germans suggest a division of Turkey, you can show our cards.”⁸ In this correspondence, Stalin “suggested” to Molotov to obtain Germany’s consent for another self-serving step to be taken by the Soviet Union. He told Molotov to advise Hitler that the Soviet proposal for an alliance with the Axis powers would “not be possible without a guarantee of our control of Bulgaria and the passage of our troops into Bulgaria.”

In November 1940, Germany was in a difficult position. World War II had been going on for more than a year, and no end was in sight. Germany could win only in a quick war. On the evening of November 13, during talks between Hitler and Molotov, the British air force bombed Berlin. The meeting that had started in a luxurious reception room ended in an underground bomb shelter. With the air raid, Churchill showed Hitler and Molotov that Great Britain did not plan to surrender.

For a drawn-out war, Hitler needed tremendous quantities of strategic raw materials, which Stalin could provide. During the meeting, Molotov repeatedly reminded Hitler that without Soviet raw materials German victories in Europe would have been impossible: “The current status would not have been achieved without the influence of the German-Russian agreement [of August 1939] on the great German victories.”⁹ “As far as Germany is concerned, these [1939] agreements secured a safe rear for Germany and played a major role in the development of a military campaign in the West, including France’s defeat.”¹⁰ “Germany, not without the help of the pact with the USSR, was able so quickly and with military glory to execute its operations in Norway, Denmark, Belgium, Holland, and France.”¹¹

Stalin twisted Hitler’s arms. Trotsky predicted that Stalin “would want to fully use the advantage of his position.” That was precisely what Stalin did. Hitler told Molotov that Germany had conquered so much territory in one year of war that it would need a hundred years to develop it. He offered: if space was needed, Germany and the Soviet Union could both move to the south of their borders. Molotov agreed with the proposal, but added that they had to discuss the issue of the Danish straits Store Bælt and Lille Bælt, as well as the straits between Denmark and Sweden and Norway, Sund, Kattegat, and Skagerrak. For the Germans, these straits were a strategic necessity, since they already occupied Denmark. Why would the Soviet Union need them?

Hitler told Molotov: “While the war is going on, Germany is extremely interested in receiving nickel and timber from Finland.” Hitler wanted to know whether the Soviet Union was preparing a war against Finland. If so, could it be postponed to a later date? Molotov answered that Finland was in the Soviet sphere of influence and that Germany had to remove its troops from Finland. Molotov “did not understand why Russia had to postpone the realization of its plans by six months or even a year. After all, the German-Russian pact did not contain any time limits and within their respective spheres of influence neither of the countries had its hands tied.”¹²

The Soviet Union had enough oil for both internal consumption and export. The Soviet Union did not need Romanian oil, while Hitler talked about Germany’s complete dependency on Romanian petroleum, asserting that Germany would defend the Romanian oil industry

at any cost. Hitler hinted that the Soviet Union should move away from Romanian oil. The Soviet Union had already taken over Northern Bukovina. With that invasion, the Soviet Union violated the pact about the division of the spheres of influence. Molotov replied that the Soviet Union did indeed take something from Romania, and did indeed violate the previously reached agreement with Germany. But the Soviet Union would not give up what it got; moreover, Stalin wanted Southern Bukovina and Bulgaria. "The fate of Romania and Hungary also interests the Soviet Union, and under no condition can it ever be indifferent to it."¹³

Hitler reminded Molotov that they had agreed about the division of Europe back in August 1939. Molotov responded that it was time for a new division of Europe that would give an advantage to the Soviet Union. "The USSR considers last year's agreement fulfilled, with the exception of the question of Finland. . . . Now it is time to talk about a broader agreement between the USSR and Germany."¹⁴ Further discussions were in the same tone.

During the course of the talks, Molotov did not raise questions about the security of the Soviet Union. Hitler brought up questions of safety from a Soviet invasion of territory crucial to Germany, but he did not receive any satisfactory reply. On the morning of November 14, 1940, Molotov left for Moscow. On November 25, the German ambassador to Moscow was told that Germany had to withdraw its troops from Finnish territory immediately. In addition, all the claims Molotov had made in his talks with Hitler and Ribbentrop were confirmed, even the demand to create Soviet bases on the Bosphorus and Dardanelles straits.¹⁵ On the same day, November 25, 1940, the People's Commissar of Defense of the USSR, Marshal of the Soviet Union S. K. Timoshenko, and the Chief of General Staff of the Red Army, General K. A. Meretskov, wrote a directive to prepare a plan for a new war of aggression against Finland.¹⁶

Hitler was preparing for a big war against Great Britain when Stalin demanded new territories in Europe—territories on which Germany's economy and armed forces depended completely. If a war against Britain weakened Germany, what would Stalin demand? Hitler found an answer to all of Stalin's demands. "After Molotov's departure, Hitler gathered his most trusted subordinates and clearly let them understand that he planned to invade Russia."¹⁷

Kremlin Games

The use of new means of struggle and new attack tactics has great value for our success. Before the enemy finds a means of countering the advance, the attacker can make use of all the advantages given by the element of surprise.

—GENERAL G. K. ZHUKOV, LECTURE GIVEN AT A CONFERENCE OF
THE HIGH COMMAND OF THE RED ARMY, DECEMBER 26, 1940

A conference of the High Command of the Red Army began on December 23, 1940. It lasted nine days and ended on the evening of December 31. The highest-ranking leaders of the Red Army—274 marshals, generals, and admirals—attended.

The conference was convened in utmost secrecy. The generals arrived in Moscow in closed railroad cars or in military airplanes. They were met in remote places, and in closed cars they were delivered to the inner courtyard of “Hotel Moscow.” The generals arriving in Moscow from other places were forbidden to go into the city. The newspapers of military districts continued to print the portraits of their commanders and reports about their daily activities, creating the impression that they were not in Moscow but at their posts. Before the start of the conference, the generals were led into buses in the hotel’s inner courtyard and driven to the General Staff building. At the end of the day, they were returned to the hotel in the same fashion. Understandably, the hotel itself was “cleared of outside elements” and placed under special security and surveillance.

Zhukov delivered the first and most important lecture on new tactics of sudden attack. Furthermore, most of the other speakers discussed only that subject. For example, Lieutenant General P. S. Klenov, Chief of Staff of the Baltic special military district, who spoke following Zhukov’s lecture, talked about special operations: “These will be operations of the starting phase, when the enemy’s armies have not yet completed their concentration and are not prepared for deployment. These are operations of invasion, for carrying out a whole chain of special tasks. . . . This is use of large air and, perhaps, mechanized forces, while the enemy has

not yet prepared for decisive action. . . . The mechanized forces will have to be used independently, and they will solve the tasks of invasion into enemy territory.”¹

The title of the second (and very important) lecture was “The Air Force in an Offensive Operation and the Struggle for Air Superiority.” The lecturer was Lieutenant General P. V. Rychagov, Chief of the Air Force Main Directorate of the Red Army. Zhukov described the lecture as “very informative.”² We had to wait another half a century, until the demise of the Soviet Union, for the publication of the conference records. The essence of the “very informative lecture” boiled down to this: “The best means of defeating [an] air force on the ground is a simultaneous strike at a large number of air bases where the enemy’s aviation is possibly located.”³

Colonel General of Tank Troops D. G. Pavlov, commander of the Western special military district, delivered the lecture titled “The use of mechanized units in contemporary offensive operations and breakthrough by mechanized corps.” Pavlov said: “Poland has ceased to exist after seventeen days. The operation in Belgium and Holland ended after fifteen days. The operation in France, before France’s capitulation, lasted seventeen days. These are three very characteristic numbers, which cannot but force me to accept them as a possible number for our calculations of our offensive operation.”⁴

At that time, according to the Soviet Field Statute, the line of defense for a division was eight to twelve kilometers wide. The lecturers at the conference unanimously advocated a widening of that line. That regulation meant a very high density of troops for defense lines. Why put so many troops on the defensive, confining them to sitting without use, when those troops were needed on the offensive? Other possibilities were examined as well, including concentrating all the forces in those locations where the Soviet Union would carry out sudden strikes against Germany, leaving secondary locations defenseless with a completely bare border in those places. This theory was supported by the Chief of Staff of the Leningrad military district, Major General P. G. Ponedelin. When, a month after the conference, Zhukov became the Chief of General Staff of the Red Army he did not forget Ponedelin, who advocated the baring of the front. Zhukov offered Ponedelin a post in a primary location: Ponedelin became commander of the 12th Army in the Lvov-Chernovitsi bulge. Ponedelin acted in the interests of an offensive: all force was concentrated in the “hitting fist” and the border was left bare. In the summer of 1941, Ponedelin’s 12th Army, as well as all Soviet troops of the 1st Strategic Echelon, was crushed. Ponedelin himself was taken prisoner. After the war, he was brought to Moscow under guard, tried, and executed.

The lecture titled “The Character of Contemporary Defensive Operations” was given by General of the Army I. V. Tulenev, commander of the Moscow military district. So, the questions dealing with defense were examined after all! Here is what Tulenev had to say in his lecture: “We have no established contemporary defense theory.”⁵ This was the truth. Until December 1940, Soviet military theory did not work on questions of defense. After December, it did not work on them either. Tulenev said that such a theory was unnecessary. The Soviet Union would defend itself, but only in separate secondary locations. The goal was to conduct grandiose sudden offensive operations on enemy territory, and therefore to amass huge forces in narrow areas. The Soviet Union had to take almost all forces out of secondary locations; it would defend itself in the bare areas. Tulenev expressed the thought that

nobody disputed: “Defense will be a part of a general offensive. Defense is an indispensable form of military operations in separate secondary locations, which allows us to save forces for offensive operations and prepare attacks.”⁶

In the conclusive speech, the People’s Commissar of Defense, Marshal of the Soviet Union Timoshenko reminded his audience to keep in mind “the possibility of the simultaneous conduct of two, maybe even three, offensive operations on different fronts in the theater of war, with the purpose of strategically shaking up the enemy’s defense capabilities as widely as possible.”⁷ Defense at the primary locations was not foreseen, even theoretically. An opinion, which was prevalent in the Red Army from the moment of its founding, was confirmed at that conference: the most important thing was to advance with entire armies, fronts, and groups of fronts; but small formations—regiments or divisions, perhaps even a corps—would sometimes be left for defense in separate locations. Some agreed that if needed, an entire field army could be engaged in defense. . . . We must remember that in June 1941, on the European territory of the USSR, there were twenty-six field armies organized in five fronts, and a group of reserve armies. A situation in which two armies, side by side, could occupy themselves with defense in one location, was considered completely improbable, and was not examined even theoretically.

The conference of the High Command of the Red Army ended at 6 PM on December 31, 1940. Most of the participants were urgently and secretly sent back to their posts. Only the most important generals remained in Moscow. Even before the conference was over, at 11 AM on December 31, a group of forty-nine of the highest-ranking generals received instructions for a strategic staff game on maps. The maps denoted battles between the “Easterners” and “Westerners.” The scope and importance of this game was the largest of all the pre-war years.⁸ Pavlov, the Commander of the Western special military district, commanded the “Easterners,” or the Soviet troops. Zhukov, Commander of the Kiev special military district, led the “Westerners,” meaning the German troops.

Pavlov’s group had twenty-four generals, one rear-admiral, one navy captain of the first rank, one navy captain of the second rank, and one colonel. Zhukov’s group, which played the role of the German command, had twenty generals, admirals, and officers besides Zhukov. The first strategic game began on the morning of January 2, 1941, at the General Staff of the Red Army. The scenario of the future war was being played out. The supervisor of the game was Timoshenko, the People’s Commissar of Defense of the USSR. The referees of the game consisted of twelve top commanders of the Red Army, including four Marshals of the Soviet Union. The observers included Joseph Stalin and the entire Politburo.

A colossal battle raged on the giant maps. For the time being just on the maps, the two most powerful armies on the planet clashed. For several days and nights, without rest or sleep, the staffs of the two opposing sides evaluated situations, made decisions, gave orders and directions. For now just on paper, thousands of tanks and airplanes, tens of thousands of guns and mortars, and millions of soldiers were brought into battle. Hundreds of thousands of tons of ammunition, fuel, and engineering and medical equipment were dispatched from the rear. Divisions, corps, and entire armies were going for the breakthrough. Soviet strategists were not working on any defense plans and not making any plans for rebutting a possible German aggression. They were thinking of a way to take Koenigsberg, Warsaw, Prague, Bucharest, Krakow, and Budapest. Soviet preparations for the invasion of Europe neared their final stage.

The game was called “Offensive Operation of the Front with Breaks through the Fortified Regions.” The theme was not simply an attack, but an attack on Germany and more precisely on Eastern Prussia, which was defended by a line of fortified regions. The attacker was the Soviet troops on the northwestern front, under Pavlov’s leadership. Pavlov delivered the blow to Eastern Prussia, to Königsberg, and Zhukov defended it.

The Communist leaders openly said that the war would be conducted only on enemy territory, as the popular Soviet antebellum song said: “And on enemy land we will crush the enemy, shedding little [of our] blood and by a powerful blow.” They had in mind a “deep penetration,” that is, a blitzkrieg. But this frankness always followed the condition that the enemy would force us into war. The Field Statute clearly stated that if the enemy attacked, the Red Army would transform itself into the most ferocious attacker of any aggressive armies.

It happened that Germany attacked precisely when the Red Army had everything ready to invade it. In November 1939, Stalin concentrated five armies on the Finnish border, got them ready, and then the Finns, as if on command, supposedly fired several cannon shells. Soviet newspapers exploded with rage: “We will repel the Finnish invasion!” “We will respond to the aggressor’s blow with a threefold one!” “We will destroy the band of pests!”

Preparations for attacking Germany followed the same rules. Stalin’s strategists, with a mysterious smile on their lips, said that if the enemy forced them into war, they would have to retaliate on enemy territory.

The tasks for the strategy game were designed according to that principle:

1. On July 15, 1941, Germany attacks the Soviet Union.
2. German troops force their way 70 to 120 km into Soviet territory, but . . .
3. . . . by August 1, 1941, they are thrown back to their original positions.⁹

The scenarios of how the “Westerners” attacked, how the Soviet army managed to throw them back and get them off Soviet territory, were not played in the game. It was just mentioned that the Germans attacked and then the Red Army drove them back to the state border. The strategic game began precisely then, when there were no enemy troops on the Soviet soil. The “retaliatory actions” of the Red Army in Eastern Prussia began from that point. The German invasion of Soviet territory and the repelling of aggression did not interest Stalin, Zhukov, and the rest. They were interested in the conduct of assault operations from the border. The leadership concluded that “unfolding the main forces of the Red Army in the West and grouping the main forces against Eastern Prussia and in the direction of Warsaw brings about serious fears that the struggle on this front can turn into protracted fighting.”¹⁰

Afterward, they played a second strategic game, but the main idea did not change: the Red Army was still the advancing side. Actually, the game started when the “Easterners” were one hundred kilometers inside the land of the “Westerners.”

The actions of German and Soviet generals were almost mirror images of each other. One month earlier, the Germans played the same games. The gap in time between the actions of Soviet and German commanders was slowly decreasing. On November 29, 1940, a large strategic game on maps began in Berlin. The supervisor of the game was Major General Friedrich Paulus, the First *Ober-Kwartirmeister* of the General Staff of the Ground Forces. In Moscow, there had been two games, in Berlin only one, but it was divided into three stages: first, the invasion by German troops of Russian territory, and battles on the border; second,

the German advance to the Minsk-Kiev Line; third, the conclusion of the war and destruction of the Red Army's last reserves, if such were found to the east of the Minsk-Kiev Line. The Germans didn't work out how they would reach Kursk, Moscow, and Stalingrad. The generals thought that one blow would bring down the entire Soviet Union and send the Red Army on the run. In Berlin, a debriefing followed each stage of the game. The main debriefing of all stages of the game ended on December 13, 1940. Nineteen days later, the strategic games in Moscow began, the second of which, as we know now, ended on January 11, 1941.

History is written by the victors. The Red Army seized the archives of the *Wehrmacht Heer*, and Soviet historians demonstrated the aggressiveness of German imperialism to the rest of the world, exposing their terrible plans. Meanwhile, Soviet archives were carefully locked. This gave the Communist propagandists and agitators the opportunity to say that Soviet generals, admirals, marshals, and Stalin himself suffered from a chronic love of peace.¹¹ However, that love of peace was only pretence. The Soviet generals did not sleep. Like their German peers, they prepared an invasion.

Of the two Soviet games, the first one was decisive. "The debriefing of the first one is concluded at the highest political leadership level in the country."¹² The "highest political leadership in the country" meant, of course, Stalin. He carefully followed the course of the first game and became convinced that the army would get bogged down in Eastern Prussia. Therefore, immediately after the first game, Stalin decided that a strike on Europe should be delivered from Ukraine and Moldova, and not from an area north of Polesye.

The second game, which dealt with "retaliatory measures" of the Red Army in Germany, Hungary, and Romania, took place between January 8 and 11, 1941. There were insignificant changes in each group of players. Certain generals were switched from side to side. A number of generals did not participate in the second game at all, others replaced them. But the main opponents remained the same. Only this time, Zhukov commanded the Soviet troops and directed the "retaliatory blow" on enemy territory, whereas Pavlov commanded the German and Romanian troops and tried to repel the Soviet advance. Why did they need to conduct two games?

Polesye—the biggest region of swamplands in Europe, possibly even in the world—lies between the Baltic Sea and the Black Sea. Polesye was unsuitable for the mass movement of troops and the conduct of military operations. The area divided the western theater of operations into two strategic directions. If one tried to be equally strong to the north and to the south of Polesye, then one had to simply divide one's forces in two. However, the main principle of strategy was concentration. The drive to be strong everywhere causes the dissipation of forces and general weakness. Therefore, forces had to be concentrated in one of the two directions to deliver the decisive blow, while in the other direction they delivered just a secondary, auxiliary attack.

The question then was which direction should be considered primary and which secondary. The arguments about this did not end. Both options had their pros and cons. Invasion into Central Europe, north of Polesye, would be a direct blow on Berlin. However, in the attacker's way lay heavily fortified Eastern Prussia and Koenigsberg. A blow to the south, however, was a diversion to the side, a roundabout route. However, it would be a blow to almost unprotected Romania, the oil heart of Germany. On synthetic fuel alone, Germany could not survive. Therefore, it was decided to play two games, compare the results, and make the choice. In the first game, the main attack on Central Europe was carried out north of Polesye, from Belarus and the Baltic.

In the second game, the invasion was carried out from Ukraine and Moldova. If Germany were crushed, the rest of continental Europe would shower Stalin with flowers and his tanks would have an open road right up to the Atlantic Ocean.

In the second game, Zhukov, in command of Soviet troops, attacked Romania and Hungary. He found it easy to advance. First of all, there were no modern fortifications there, like those in Eastern Prussia. Zhukov had indisputable superiority of aviation, tanks, and paratroops. "The second game . . . ended with the 'Eastern' decision being made to attack Budapest." Zhukov commanded the "Eastern" group in the second game, and it was he who made the decisions about breaking through to Lake Balaton and crossing the Danube River near Budapest. The decision so far was only made in the course of a strategy game, but Zhukov himself already said that the games did not have an academic character, but were directly tied to the imminent war. Stalin was not present at the second game and did not conduct its debriefings, because he had already made his choice after seeing the results of the first one. The Soviet invasion of Europe would be conducted south of Polesye.

All the Way to Berlin!

The peasant-worker Red Army will be the most aggressive of any attack army that ever existed.

—FIELD STATUTE OF THE RED ARMY, 1939

By sending all his divisions to France, Hitler had turned his back on Stalin. Stalin then feverishly destroyed his defenses and increased the attacking power of the Red Army. The Dnepr military flotilla was one of the many defense systems of the Soviet Union. The great river Dnepr blocked the way into the depth of Soviet territory to aggressors from the west. All the Dnepr bridges were mined before 1939, and they could be demolished in such a way that nothing would be left to restore. In all preceding campaigns, German troops had never had to cross a single water barrier equal to the Dnepr. The pressing of a few buttons, at least in the middle and lower Dnepr regions, could stop German tank units. In the early 1930s, the Dnepr military flotilla was created to prevent the crossing and establishment of temporary bridges across the river. By the beginning of World War II, the flotilla counted 120 warships and motorboats, including eight powerful coastal monitors with cannon up to 130 mm.¹ On top of that, the Dnepr flotilla had its own air force, and shoreline and air-defense batteries. The left bank of the Dnepr was suitable for river warships: it had many islands, bypasses, and backwater hideaways, which allowed warships, including the largest ones, to hide from the enemy and carry out surprise attacks, preventing the enemy from crossing the river.

The Dnepr water barrier—with its bridges primed for demolition and the river flotilla that could act together with field troops, artillery, and aviation—could securely close off the roads to the industrial regions in the south of Ukraine and to the Black Sea bases of the Soviet Navy. The German *blitzkrieg* could be stopped on the Dnepr line, or at least be held up for several months. If that had happened, the entire course of the war would have been different. However, just when Hitler turned his back on Stalin, Stalin ordered the removal of mines from the Dnepr bridges and the disbanding of the military flotilla. The Dnepr flotilla could

be used only on the territory of the Soviet Union and only in a defensive war. It was obvious why Stalin believed he did not need it.

Stalin divided the defensive Dnepr flotilla into two: the Danube flotilla and the Pinsk flotilla. In the summer of 1940, Stalin tore Northern Bukovina and Bessarabia from Romania. The Soviet Union received an area of several tens of kilometers on the eastern shore of the Danube River. The Danube flotilla, formed in advance, was immediately transferred to this area. It was not easy to transfer the ships from the Dnepr: small ships were sent by railroad, and large ones sailed in the Black Sea during quiet weather and with special precautions. The Danube military flotilla included sixty-three river warships and motorboats, among them five monitors and twenty-two armored motorboats, plus air force units, and anti-aircraft and shoreline artillery.² The location of the flotilla was horrible. The Soviet shore of the Danube was bare and open. Ships were stationed at the banks, while Romanian troops stood nearby, sometimes three hundred meters from the Soviet ships. In the event of a defensive war, the entire Danube flotilla would fall into a trap from the beginning: there was nowhere to retreat from the Danube delta but to the Black Sea, the waves of which could sink the ships built for river. The flotilla had nowhere to maneuver. A surprise attack from the enemy would have meant machine-gun fire at the Soviet ships, not giving them the possibility to lift anchor and detach the mooring lines. Moreover, no enemy would invade the Soviet Union through the Danube delta, since it consisted of hundreds of lakes and impassable swamps. This means that the Danube flotilla was not needed to defend the newly “liberated” lands of Bessarabia.

There was only one possible action for the Danube flotilla: in the course of a general invasion by the troops of the Red Army, the flotilla could carry out operations up the river. If you amassed in the delta of a great river more than sixty river warships, they would have nowhere to go except up the stream. There were no other directions. If it sailed up the Danube, the flotilla would have to fight on Romanian, Bulgarian, Yugoslavian, Hungarian, Slovak, Austrian, and German territory.

In a defensive war, the Danube flotilla would be useless, and it would be sentenced to immediate destruction at its open bases on the shores. But in a war of aggression, the Danube flotilla was deadly for Germany: it only had to sail three to four hundred kilometers up the river, and the strategically important bridge at Chernavoda would be within firing range of its cannon, which meant that the petroleum supply from Ploiești to the port of Constanza would be disrupted. Another hundred kilometers upstream, and the entire German war machine would stop, simply because German tanks, planes, and warships would be out of fuel.

Here is an interesting detail: several mobile shoreline batteries of the Danube flotilla were armed with 130-mm- and 152-mm-caliber cannon. If the Soviet command had truly decided that someone would try to invade the USSR through the Danube delta, the shoreline batteries should immediately have been dug into the ground, and at the first chance reinforced concrete caponiers should have been built. But no one built any caponiers, so the cannon remained mobile. Their mobility could only be used in aggressive operations: the mobile batteries could accompany the flotilla, moving along the shorelines and supporting the warships with fire.

The reaction of the Danube military flotilla's commanders to the beginning of the Soviet-German war was surprising. The word “war” meant to Soviet commanders invasion,

not defense. Having learned that the war had begun, the Soviet commanders finished their last preparations for landing operations. The actions of the Soviet flotilla commanders, as well as those of the 14th Rifle Corps, divisions of which were concentrated in the Danube delta region, and of the 79th Border Unit of the NKVD, were planned beforehand and meticulously worked out.

On June 25, 1941, the warships of the Danube flotilla, under cover of fire from the shoreline batteries, landed reconnaissance and sabotage units of the NKVD on the Romanian shores, followed by regiments from the 51st Rifle Division of the 14th Rifle Corps. Soviet soldiers acted decisively, boldly, and quickly. The complicated operation, which involved river ships and aviation, as well as field, shoreline, and ship artillery, units of the Red Army and the NKVD, was worked out with immaculate precision. On the morning of June 26, 1941, a red flag went up above the central church of the Romanian city of Kilia. A key springboard area of seventy kilometers of Romanian territory had fallen into Soviet hands. The Danube flotilla was preparing for further invasion operations up the Danube. To aid the flotilla, the 3rd Paratroops Corps stationed in the Odessa district could be sent out. But all this had to be cancelled, because on other areas of the front the Red Army was retreating; an order to retreat was issued to the Danube flotilla as well. With the Black Sea behind it, the Danube military flotilla found itself cut off from Soviet troops without the possibility of retreat. Most of its ships had to be sunk, while gigantic supplies, stored toward the movement of the flotilla up the river, had to be burned, or simply left behind.

Hitler and Stalin both understood perfectly well what the expression “oil is the blood of war” meant. Colonel General A. Jodl testified that, in an argument with Guderian, Hitler declared: “You want to invade without oil—well, we shall see what comes out of this.” As early as 1927, Stalin took seriously the problems of the impending World War II. On December 3, 1927, he said: “It is impossible to fight without oil, and he who has the advantage in terms of oil has the chance of victory in the impending war.”³ In June 1940, when nobody was threatening the Soviet Union, tens of Soviet river military ships appeared in the Danube delta. That step had no defensive value, but was a threat to the unprotected Romanian oil routes and consequently a deadly threat to Germany.

In July 1940, Hitler conducted intensive consultations with his generals and concluded that it was not at all easy to defend Romania: the supply routes extended all over and passed through the mountains. If a huge number of German troops were transferred to defend Romania, western Poland and eastern Germany, including Berlin, would be exposed to a Soviet attack. If a lot of troops were concentrated in Romania and tried to keep it at any cost, it would not help: the territory perhaps would be retained, but oil fields would still burn up from bombings and artillery fire.

In July 1940, Hitler for the first time said that the Soviet Union could be dangerous, especially if German troops left the continent for the British Isles and Africa. On November 13, 1940, in a conversation with Molotov, Hitler indicated the necessity to retain a huge number of German troops in Romania, obviously hinting that the Soviet military posed a threat to Romanian oil.⁴ Molotov ignored the hint. After Molotov's departure in December, Hitler issued a directive for the preparation of Operation Barbarossa.

In June 1940, when the German army was fighting in France, Zhukov, on Stalin's orders and without consulting the German allies, brought river warships to the Danube delta. Hitler asked the head of the Soviet government to divert the Soviet threat from the oil heart of Germany. Stalin and Molotov refused.

A fortnight after Hitler's invasion of the USSR, on July 7, 1941, Stalin sent a telegram to the commander of the southern front, General I. V. Tulenev. In the telegram, Stalin demanded that the Soviet Union retain Bessarabia at any cost, "having in mind that we need the Bessarabian territory as a springboard for organizing our invasion."⁵ Hitler had already delivered his sudden blow, but Stalin still did not think of defense—his main concern was organizing an invasion from Bessarabia, meaning an attack on the Romanian oil fields.

The invasion of Bessarabia by the Soviet Union and the concentration there of powerful aggressive forces, including the paratroops corps and the Danube flotilla, forced Hitler to look at the strategic situation from a completely different perspective and to take preemptive measures. But it was already too late. Even the sudden attack of the *Wehrmacht Heer* on the Soviet Union could not save Hitler and his empire.

In the memoirs of Marshal of the Soviet Union G. K. Zhukov, there is a map of the location of Soviet naval bases in the first half of 1941. Among these bases, one was in the vicinity of the city of Pinsk, in Belarus.⁶ It is at least five hundred kilometers away from the nearest sea. After the disbanding of the purely defensive Dnepr military flotilla, some part of its ships were sent to the Danube delta, and others were sent upstream to the tributary of the Dnepr—the river Pripyat'. Ships were sent up almost to the sources, where the width of the river hardly reached fifty meters. That was where a new base for the flotilla was built.

The Pinsk military flotilla almost rivaled the Danube flotilla in might—it included four 263-ton displacement *Zhelezniakov*-class monitors and five captured Polish monitors, ranging from 130- to 150-ton displacement. Altogether, the Pinsk flotilla had sixty-six river warships and cutters, a squadron of airplanes, a company of marines, and other units.⁷ It was difficult to use the Pinsk flotilla for defense: the coastal monitors that came here had their bows turned west, and turning such huge ships around in a narrow river was complicated. If the ships were needed for defense, they should have been left in the Dnepr, because there was nothing for them to do on the quiet forest river Pripyat'. It was unlikely that the enemy would advance through the impassable forests and treacherous swamps.

The purpose of the Pinsk flotilla remains unclear, if one does not think of the Dnepr-Bug Canal.

Immediately after the "liberation" of Western Belarus in 1939, the Red Army started digging a more than 100-km-long canal from Pinsk to Kobrin.⁸ The canal was built in the summer and winter. Sapper units of the 4th Army and "construction units of the NKVD"—that is, thousands of inmates from the GULAG—participated in its completion. The fact that the construction was commanded by Colonel (later Marshal of Engineering Troops) Alexey Proshliakov alone spoke of its purely military purpose. The canal was built in truly horrendous conditions. Equipment sank in the swamps, and the only way to complete the canal within the deadline set by Stalin was to do everything by hand. The canal was built. Nobody knows exactly how many human lives it cost. The canal connected the Pripyat' with the river Bug. The only use for the canal could be to let ships reach to the Vistula basin and further west. The canal had no other use. In a defensive war, it would have had to be destroyed to prevent German river ships from passing through the Vistula to the Dnepr. In the defensive war of 1941, all the ships of the Pinsk flotilla had to be blown up and abandoned. At the end of 1943, when the Red Army was rapidly advancing west, a flotilla was once again formed on the Dnepr, and once again it went up the Pripyat' River to the small river Mukhavets, which flowed into the Bug.

Admiral V. Grigoryev, who in 1943 received the new flotilla in the Kiev region, remembered the words of Zhukov: “‘Along the Pripyat’, you will be able to reach [the] Bug, Narev, and Vistula toward Warsaw, and then transfer to the German rivers. Who knows, perhaps all the way to Berlin!’ He made a sharp turn, gave me an intense look, and repeated, stressing each word: ‘All the way to Berlin! Ah?’”⁹

In 1945, Admiral Grigoryev reached Berlin with his flotilla.

The Red Army had no marines. For land battles, it was easier and cheaper to use regular infantry, and landing on faraway shores was not yet in the plans. But suddenly Hitler made a thrust to the west, baring his back to Stalin. This careless step by Hitler brought on the most radical structural changes within the Red Army: the remains of defense were obliterated, while the offense was strengthened. The Soviet Marines were born in June 1940, when Hitler crushed France. At that time, there were two ocean fleets and two sea fleets in the Soviet armed forces, as well as two river flotillas: the Amur and the Dnepr. The ocean fleet did not receive any marines. The Pacific and Arctic oceans did not interest Stalin at the time. The Amur flotilla safeguarded the far eastern Soviet borders and also did not receive any marines. The Dnepr flotilla was divided into two attacking flotillas, and the Pinsk one, located in the Belarussian forests, received a company of marines. How interesting: marines not on the oceans, but in the Belarussian swamps. We can infer from these facts where Stalin was preparing for defense and where he was preparing for invasion.

A brigade of marines numbering several thousand men was formed as part of the Baltic fleet, whose only possible enemy could be Germany and its allies. On June 23, 1941, Soviet marines received their “battle baptism” during the defense of the naval base at Liepaja. The base was less than one hundred kilometers away from the German borders, but had no land obstacles and was not at all prepared for defense. According to testimony from Soviet admirals and German trophy documents, the bay of Liepaja was packed with Soviet submarines “like a can of sardines.” The official history of the Soviet navy, published by the Academy of Sciences of the USSR, openly acknowledged that Liepaja was being prepared as a frontline base of the Soviet fleet for aggressive warfare on the seas.¹⁰ The marines in Liepaja were situated so close to the German borders that in the first twenty-four hours of the war they had already participated in defensive battles, although, of course, they had been created for a totally different purpose. In a defensive battle, regular infantry was far superior to marines.

The Danube military flotilla had two land-army companies, which officially were not listed as marines. But even before the German invasion, at least two Soviet rifle divisions—the 25th Chapaev and the 51st Perekop from the 14th Rifle Corps—prepared themselves in the Danube region for action as marines, and in the first days of the war they landed on Romanian shores.

The Black Sea fleet had even more powerful forces. Officially it had no marines, but in early June 1941, the 9th Special Rifle Corps under the command of Lieutenant General P. I. Batov was transferred from the Trans-Caucasus to the Crimea. The corps was very unusual in its personnel, arms, and training. On June 18 and 19, 1941, the Black Sea fleet conducted grandiose training exercises of an aggressive nature, during which one of the divisions of the 9th Special Rifle Corps was loaded on warships and performed a landing on “enemy” shores. A landing of an entire division from warships had never before been practiced in the Red Army.

The Kremlin paid special attention to the joint exercises of the fleet and the troops of the 9th Special Rifle Corps. These exercises were observed by high-ranking commanders who had specially arrived from Moscow. One of them, Vice Admiral I. I. Azarov, said that all the participants of the exercises felt that the training was not being conducted without reason, and that soon they would have to use in war what they had learned.¹¹ If the war began and the Soviet command sent the 9th Special Rifle Corps into action in accordance with its battle profile and designation of its preparations, where could it land? It was unlikely that it would land on Soviet shores, but possibly in Romania, Bulgaria, or Turkey. No matter where the troops landed, they would have to be supplied, which required either additional landing of troops or the advance of other Soviet troops through Romania to connect with the 9th Special Rifle Corps. During those same days, the 3rd Paratroops Corps, also in the Crimea, conducted grandiose training exercises with the landing of corps and brigade staff.

Soviet historians never connected these three events: the training of the 14th Rifle Corps for landing from ships of the Danube flotilla; the 3rd Paratroops Corps exercising in the Crimea (a short flight to the Danube's mouth); the training of the 9th Special Rifle Corps to land from warships of the Black Sea fleet. But these events were linked in time, place, and objective. They were the final stages of preparation for aggression on a grand scale.

Mountain Divisions on the Steppes of Ukraine

Airborne assault landings will be effective in mountainous battle areas. Since troops, headquarters, and support units, which operate in the rear, are particularly reliant on roads, it is possible to use air assaults to capture enemy troops operating in the rear, to attack his communications and roads, commanding heights, ravines, passes, railway junctions, and so on, and this can produce exceptionally important results. In general terms, the dropping of an assault landing force will hardly be expedient outside the framework of an offensive operation.

—*VOENNYI VESTNIK* [MILITARY HERALD], 1940

In 1941, the Soviet Union was preparing, painstakingly and tirelessly, for war. Each Soviet army had its unique structure, character, and purpose. Each “cover” army was created to deal with a clearly defined task in the forthcoming war of “liberation.” Sufficient material has been published to provide for a separate study on each of the thirty Soviet armies that existed in the first half of 1941. If a detailed study were made of the structure, disposition, and direction given to the training of just one Soviet army, the “liberation” tendency inherent to all Soviet preparations would become quite obvious.

Take, for example, the 9th Army. In number and name, it was not different from other Soviet armies, but it was a very unusual army. In 1941, this was the most powerful army in the world. It had six corps, including two mechanized (by June 22, 1941, 799 tanks altogether) and one cavalry corps. In total, on June 21, 1941, the 9th Army counted seventeen divisions, including two aviation, four tank, two motorized rifle, two cavalry, six rifle, and one mountain-rifle division. The rifle, motorized rifle, and cavalry divisions had tanks as well. By June 1, 1941, the Odessa military district, the divisions and corps of which became part of the 9th Army, had 1,114 tanks.¹ Another mechanized corps, the 27th (by June 22, 1941, it had 356 tanks), under the command of Major General I. E. Petrov, was to be added to the 9th Army. The corps was created in the Turkmenistan district and, before completing its formation, was secretly transferred west. After yet another mechanized corps was included, the 9th Army should have had twenty divisions, including six tank divisions.

The Soviet 9th Army was opposed by forces which had no tank divisions at all. The 9th Army was not yet completely manned and equipped, but it was planned to be in the next days and weeks, and by the highest quality weapons.

Colonel General P. Belov (at that time Major General, Commander of the 2nd Cavalry Corps of the 9th Army) testified that even the cavalry of this army was preparing to receive the best tanks in the world, the T-34.² At the head of the 9th Army was a colonel general. At that time, this was an extremely high rank. In all the armed forces of the USSR, there were only eight colonel generals; moreover, in the mighty Soviet tank troops there was none, in aviation there was none, and in the NKVD there was none. At the head of thirty Soviet armies were major generals and lieutenant generals. The 9th Army was the only exception among them.

In addition, the most promising officers and generals were gathered in this exceptional army. Three future Marshals of the Soviet Union were among them: Malinovsky, Zakharov, and Krylov, future Marshal of Aviation and three-time Hero of the Soviet Union Pokryshkin, future Marshal of Aviation Pstygo, future Army Generals Petrov, Pavlovsky, and Lashchenko, and many other talented and aggressive commanders who had already proven themselves in battle, like the twenty-eight-year-old Air Force Major General Osipenko. They all expressed hopes, which in most cases were later fulfilled. A caring hand carefully picked the best and most promising and placed them in this army.

But where was this super-army located? Here an amazing discovery awaits us: the 9th Army was not located near the German border. In the first half of June 1941, the Soviet Union was forming the most powerful army in the world on the Romanian border. The 9th Army was created in the fall of 1939, immediately after the signing of the Molotov-Ribbentrop Pact. Its appearance was always an unwelcome sign for the country on whose border it emerged. In the fall of 1939, the 9th Army was deployed on the Finnish border. A week after the completion of its formation and concentration, the 9th Army fought for the bloody “liberation” of Finland. After the Finnish war, the army disappeared. The 9th Army command was disbanded on March 26, 1940. The army suddenly appeared again in June 1940 on the Romanian border. Ahead was a “liberation crusade” into Bessarabia, and Soviet sources indicated that the 9th Army was created especially for the completion of that important task.³ After another brief “liberation crusade,” the 9th Army disappeared again and its command was disbanded on July 10, 1940. In reality, its troops remained on the border, but in order not to alarm the neighbors those troops were not officially called an “army.” On June 14, 1941, the 9th Army again “reappeared” on the Romanian border, in the same exact place where a year ago it had completed the “liberation.”⁴ A new “liberation crusade” of the 9th Army into Romania would have entirely changed the strategic situation in Europe and in the world, since Romania was Germany’s main source of oil. A blow to Romania meant death to Germany.

But Hitler did not allow any of that to happen. In the declaration made by the German government to the Soviets at the start of the war, reasons were listed for the German attack against the Soviet Union. Among them was the unjustified concentration of Soviet troops on Romanian borders, which presented a clear danger to Germany.

Let’s pay attention to the mountain rifle divisions in the 9th Army. The 9th Army was located on the Romanian border, and its headquarters was in Odessa. There are no mountains in the Odessa military district. The 30th Irkutsk Mountain Rifle Division of the 9th

Army could be used only in Romania. There were plenty of mountains there. It is not at all coincidental that this division (commanded by Major General S. G. Galaktionov) was part of the 48th Rifle Corps of Major General Malinovsky, the most aggressive corps commander on the entire southern front. The 48th Rifle Corps was in the flank of the 9th Army which was closest to the front. If the 9th “Shock” Army moved to Romania, then most of the army would be fighting on flat land, while its right flank would scratch at the mountain chain.⁵ For this situation, it was most reasonable to have one mountain-rifle division, and precisely on the rightmost flank, which was exactly what was done.

Let’s examine another army, which was a carbon copy of the 9th Army. Formally, it was called just the 12th Army. It had one mechanized and two rifle corps, and other units. It had nine divisions, including two tank divisions and one motorized division. It was indistinguishable in number, name, and composition from other similar invasion armies. It had been set up specifically for the “liberation crusade” of the Red Army into Poland.⁶ It then had a tank corps, two cavalry corps, and two rifle divisions. It had little artillery and infantry, because there was no need here to break through a powerful defense. To the contrary, it had mobile troops necessary for a fast advance.⁷

Its subsequent fate was also typical. After the “liberation” campaign in Poland, the army stayed on the German border. Later, the 12th Army underwent the same transformation as all adjacent invasion armies. Its main strike mechanism was no longer called a tank corps, but a mechanized corps, to allay the fears of the leaders of neighboring countries. The deletion of the word “tank” from the corps’ name was followed by an increase in the number of tanks in the army. The cavalry was taken away from it. Its capacity for disrupting the enemy’s defenses was increased. The number of rifle divisions was tripled, and the amount of artillery in each division was doubled. In addition, one artillery brigade and four separate artillery regiments were added to the army. The capability to counter the enemy’s engineering defenses also increased when a separate regiment of engineers was brought into the army.

The unusual feature of the 12th Army was its ethnic composition. When Stalin was preparing to invade Poland in 1939, he filled the 12th Army with Ukrainians, apparently bearing in mind the long-standing animosity between Poles and Ukrainians. The army was formed in Ukraine. Therefore, the reservists were also drawn from there, and they formed a solid majority in the 12th Army. Far-reaching changes had already taken place in 1940. Ethnic Russians were appointed to key posts to mask the army’s unusual ethnic composition. The greater part of the army, however, was neither Ukrainian nor Russian. It was Caucasian: there were Georgians, Armenians, and Azeris in other armies, but their presence was particularly strong in the 12th Army. General Zhukov, who commanded the Military District, sought out Colonel I. K. Bagramian, an Armenian who was a longtime friend, from his job as a military academy lecturer, and appointed him Chief of the Operations Branch (War Planning) of the 12th Army. General Agrat Arushunyan, another Armenian, became the army’s chief of staff.

Zhukov gathered natives of the Caucasus into the ranks of the 12th Army because it was secretly but steadily changed into a mountain army. Zhukov personally demanded of its commanders that their troops should have a thorough knowledge of the Carpathian passes, not just on paper but from practical experience. In 1940, he ordered that “specially reinforced groups, made up of various combat vehicles and means of transport, should in the autumn be

sent through the passes along all more or less passable routes to make sure they could be surmounted in practical conditions by tanks, motor vehicles, tractors, animal-drawn transport, and pack-carrying beasts.”⁸

During the same year, German generals were secretly carrying out identical experiments on their western borders in the mountains. Their goal was to prepare a sudden attack against France and its allies. The German generals had to make sure that troops, tanks, artillery tractors, and transport could pass through the Ardennes. The German mountain experiments were successful. The attack on France was unanticipated both in time and place, and it was deadly.

The Soviet commanders were preparing to do the same against Germany. Marshal of the Soviet Union Bagramian, then a colonel responsible for planning the military operations of the 12th Army, said: “When I was studying the operational plans, I was struck by the following fact—our frontier army had neither a deployment nor a border-protection plan.” The colonel’s words demonstrate that the safe of the operations branch of the 12th Army contained plans. They were complex documents that had to be studied. Yet among those war plans there were none for defense.

Bagramian also described training exercises of the 12th Army attended by General Zhukov. Only offensive tactics were worked on, and on the maps the war took place on German territory. The game began with Soviet troops crossing the border river San. The military game was against a real enemy and it involved top secret intelligence information. Differences arose between Zhukov and the army commander. Commander of the 12th Army General Parusinov insisted: “We must do our best to inflict maximum casualties on the enemy with our first strike.” Zhukov understood that these were good intentions, but he wanted a strike on a wide rather than a very narrow front. That was what the argument was about. Shortly after the argument, Parusinov was replaced by General P. G. Ponedelin, Zhukov’s old friend. Then, the experiments in how to master the mountain passes continued.

Zhukov wasn’t interested in the mountain passes because of defense. If he had wanted to make the passes impassable to the enemy, he would have sent his troops to the mountains, dug up all mountain paths and roads, and built reinforced concrete fortifications near the passes, instead of right alongside the border river. It would have been more economical; the enemy could not have observed the construction work and would have been unable to cross the passes. But would anyone really attack the Soviet Union across mountain ranges when there were plenty of open spaces?

The mountains were exceptionally important to the Soviet command. Germany was separated from her main source of oil by a double barrier of mountains, in Czechoslovakia and Romania. A Soviet strike across the passes in Czechoslovakia or Romania would effectively cut the oil artery. Marshal Zhukov wrote: “Germany’s weak spot was oil supply, but it made up for this to some extent by importing oil from Romania.”⁹ The experiments in the mountains continued. The capabilities of each kind of troops and every type of combat and transport vehicle, operating in the conditions which prevailed in the Carpathian passes, were carefully studied. Standards were established and carefully checked, and guidance was compiled for the troops. The time taken by various types of vehicle to negotiate these mountain passes was carefully recorded and analyzed. The collected information, of course, was crucial for the planning of offensive operations, especially lightning operations. Bagramian was recording time frames to plan on the basis of very specific data.

None of the experiments were needed for defense. If the Carpathian passes had to be defended from the enemy, then speed was not needed: the soldiers simply had to stay where they were and not let the enemy pass.

In the 12th Army, as in all other Soviet armies, things were not called by their real names. In January 1940, the 96th Rifle Division was reorganized into a mountain rifle division. In May 1941, three more rifle divisions (the 44th, 58th, and 60th) were converted into mountain rifle divisions. At the same time, the recently formed 192nd Mountain Rifle Division was also added to the 12th Army. What did one call the 13th Corps, which had two divisions and both were mountain rifle ones? What did one call the 17th Corps, in which three out of four divisions were mountain rifle ones? What did one call an army, which out of its three corps had, in fact, two mountain rifle corps, and in which the mountain rifle divisions were a solid majority? I would call the corps “a mountain rifle corps” and the army “a mountain army.” But the Soviet High Command had reasons for not doing this. The corps continued to be called, as before, the 13th and 17th Rifle Corps, while the army was simply called the 12th Army.

The mountain rifle divisions were given their official name on June 1, 1941, while the order was issued on April 23, 1941; the actual transformation of the divisions from “rifle” into “mountain rifle” divisions was going on as early as the autumn of 1940.¹⁰ The 12th Army also influenced adjacent armies. The 72nd Mountain Rifle Division under the command of Major General P. I. Abramidze had been trained in the 12th Army and was transferred to the adjacent 26th army. Lieutenant General I. S. Konev’s 19th Army, which was being transferred from the northern Caucasus, was then secretly deployed behind the 12th and 26th armies. It also had mountain rifle divisions, for instance, the 28th Division under the command of Colonel K. I. Novik. It was at this time that deployment of yet another army, the 18th, began in the area between the 12th (mountain) and 9th “super-shock” armies in the eastern Carpathians. There are sufficient documents to infer that the original idea was that the 18th Army would be a carbon copy of the 12th (mountain) Army, although like the 12th it did not bear that name. Any researcher who studies the archives of the 12th and 18th armies will be surprised by their absolute similarity in structure. It is a most unusual example of twin armies.

The mountain rifle divisions were reinforced with specially selected and trained soldiers. These divisions were transferred to a special personnel composition, very different from the regular rifle divisions; they received special weapons and equipment. Just before the war began, a school for mountain training was established in the Caucasus. It trained the best Soviet mountain sportsmen and climbers to be military instructors. Once fully trained, these instructors were sent to the Soviet western frontier, since it was precisely here, and not in the Caucasus or Turkestan, that in June 1941 a great number of mountain rifle troops were concentrated.¹¹

It is time to ask: for which mountains? There is only one comparatively small mountain range on the Soviet western frontier. The eastern Carpathians resemble gently sloping hills rather than mountains. There was no point in having a powerful defense in the eastern Carpathians in 1941. First, that area of the Carpathians was dangerous and unfavorable for an aggressor coming from west to east. The enemy would come down from the mountains to the plains, and its army would have to be supplied across the whole of the eastern Carpathian, the Tatry, the Erzgebirge, and the Sudeten mountains. Second, the northern slope of the

eastern Carpathians formed a blunt wedge on the enemy's side of the frontier. If many Soviet troops were concentrated there for defensive purposes, even in peacetime, they would be surrounded by the enemy on three sides. By using the plains farther to the south, and especially more to the north of the eastern Carpathians, the enemy could strike at any time at the rest of the troops deployed on the mountains, thereby cutting their supply lines. Third, in 1941, there were too few enemy troops in the Carpathian Mountains to carry out an aggression, and the Soviet High Command was fully aware of this.¹²

The concentration of two Soviet mountain armies in the eastern Carpathians had catastrophic consequences. Nobody attacked these armies in the mountains. The German 1st Tank Group carried out its strike in the plain to the north of the eastern Carpathians, bypassing the mountains and cutting off the Soviet mountain armies from the main forces. The Soviet command confronted a dilemma: should they leave the two mountain armies in the Carpathian Mountains, where they would perish without a supply of ammunition and food, or should they urgently be led out of that mousetrap? They made the second choice. The two mountain armies, unprepared to fight in the plains, having light weapons and a lot of equipment useless in a flat area,¹³ fled from the mountains and immediately fell under attack from the German tank units. Having easily destroyed the fleeing Soviet mountain armies, the 1st Tank Group of the German army went ahead full speed and reached the rear of the Soviet 9th Army and defeated it. Once the German troops had dealt with those armies, the road opened to the totally undefended bases of the Soviet navy, to the Don basin, Kharkov, Zaporozhie, and Dnepropetrovsk. These were industrial regions of great importance. Once they were lost to the Germans, the Soviet Union produced only 100,000 tanks for the rest of the war, which was much more than Germany, but without the losses of these regions, the Soviet tank production could have been several times higher. When the Germans broke through to the south of Ukraine, the Soviet troops around Kiev found themselves in a very dangerous position. The Germans had cleared the road to the Caucasus and to Stalingrad—the heart of Soviet oil production.

The two mountain armies in the Carpathians in 1941 were completely unnecessary for defense. They were necessary only for offense. In early 1941, specially trained groups of rock climbers appeared in the mountain rifle divisions. But in the eastern Carpathians, they had nothing to do. Soviet troops had to be moved west by several hundred kilometers. The same factors that made the Carpathians unsuitable for aggression from west to east made them very suitable for aggression from east to west. As the troops moved ahead into the mountains, their supply lines remained on Soviet territory, mainly on very flat terrain. The eastern Carpathians jutted far out into the west and cut the enemy grouping in two. This was a natural springboard which, if heavy forces were built up on it in peacetime, positioned them as if they were in the enemy's rear. They only had to advance, threatening the enemy's rear and thus compelling its troops to withdraw along the whole front.

Only negligible enemy forces were located in the Carpathian Mountains. The Soviet High Command knew this, and that was precisely why they had concentrated two armies there. The only way to use these armies in war was to move them forward. Two mountain ridges spread from the Carpathians: one went west toward Czechoslovakia, the other south toward Romania.

Stalin in May

Stalin [has] put before himself a foreign policy goal of tremendous importance, which he hopes to reach through personal efforts.

—COUNT VON DER SCHULENBURG, SECRET REPORT TO
THE GERMAN GOVERNMENT, MAY 12, 1941

On May 4, 1941, Stalin became chairman of the Soviet government,¹ replacing Molotov who became deputy chairman. At that time, many British and American politicians and diplomats were confused by that turn of events. For the first time in Soviet history, the top party and government leadership was officially concentrated in one man's hands. In 1922, having assumed the position of general secretary of the Communist Party, Stalin refused to take any government positions. Stalin elevated his command post above the government and above the country. Officially, he was responsible for nothing. All successes were attributed to Stalin. All failures were attributed to his enemies, careerists who took advantage of and distorted the orders of Stalin the genius. The “victory of the collectivization” was a creation of Stalin's genius, while millions perished from hunger because of the mistakes of regional level functionaries. Stalin officially had no ties to the Great Purge—Ezhov, the People's Commissar for Interior Affairs, shouldered the whole blame. That period was derogatorily called *Ezhovshchina*.

It wasn't Stalin who signed a pact with Hitler. The treaty entered history as the Molotov-Ribbentrop Pact. In Germany, the responsibility for the pact was borne not so much by Ribbentrop as by Adolf Hitler, the chancellor, though he was not present when the pact was signed. But Stalin, who was present at the signing, had no government position at that moment. On April 13, 1941, a pact was signed with Japan: Stalin was present, but again, did not shoulder any responsibility. Hitler many times invited Stalin to a personal meeting in a friendly atmosphere. But Stalin sent Molotov to meet Hitler.

Then, when the victors were clearly defined, Stalin, of course, personally met with Churchill and Roosevelt. During the course of talks at the highest level, Stalin never said no.

Molotov did it for him. He even received the nickname “Mr. No.” All demands came from Molotov, all concessions from Stalin. Simply put, Stalin did good with his hands, and evil with the hands of others. Those who did evil on Stalin’s orders carried the responsibility, while Stalin remained clean.

However, in May 1941, Stalin took on the official burden of government responsibility. For Stalin a new title meant not a strengthening of power, but a limiting of it, more precisely self-limiting. From then on, he not only took the most important decisions, but also carried official responsibility for them. Until then, Stalin’s power had only been limited by the outside borders of the Soviet Union, and not always even by them. What forced him to voluntarily take on the burden of responsibility for his actions?

Admiral of the Fleet of the Soviet Union N. G. Kuznetsov testified: “When Stalin took on the duties of Chairman of the People’s Commissars Council, the system of leadership practically did not change.”² If practically nothing changed, why did Stalin need the new title? “Meanwhile, all of Stalin’s deeds and crimes were focused, logical and calculated.”³

What was Stalin’s logic? “I don’t know any problems that could relate to the internal situation in the Soviet Union and be so serious as to elicit such an action from Stalin. I would be more certain in stating that if Stalin decided to take the highest government position, the reasons for his action should be sought in the [realm of] foreign affairs,” reported Schulenburg, the German ambassador to Moscow. Soviet marshals said the same thing: Stalin’s appointment was tied to foreign affairs.⁴

Let us examine what foreign policy problems Stalin was expected to solve in May 1941. Germany crushed many European countries, so there could be no problems with the governments of those countries. The Soviet Union had friendly relations with France, the large part of which was occupied by Germany. There were no problems with Britain: it retained independence and stretched a hand of friendship to Stalin, exemplified in a letter from Churchill to Stalin dated July 1, 1941. Roosevelt was more than amicable toward Stalin: he warned him of dangers, and American technology flowed into the USSR. There were only two possible enemies. Japan had seen a demonstration of Soviet might at Khalkhin-Gol in August 1939, signed an agreement with the Soviet Union, and looked away from Soviet borders. Therefore, only Germany could have forced Stalin to take the step that seemed inexplicable at first glance.

What could Stalin, using his new official title of head of the government, undertake regarding Germany? There were three possibilities: establish an unshakeable peace with Germany; officially lead an armed struggle against German aggression; or officially lead a sudden attack on Germany.

The first possibility can be ruled out immediately, because Molotov had already signed a peace pact with Germany. Stalin continued to use Molotov for peace talks. It is known that even on June 21, 1941, Molotov tried to meet with German leaders, while Stalin made no such attempts.

The second possibility also doesn’t withstand examination. Stalin could not have assumed leadership in anticipation of a German attack, simply because he did not foresee it. In the first day of the war, the head of the government should have addressed the people and told them the terrible news. But Stalin avoided fulfilling his duties, and on June 22 Molotov spoke to the people. Why would Stalin sit in Molotov’s chair in May, only to hide behind

his back in June? In a defensive war, Stalin used his well-tested method of ruling the country: he took all important decisions, but the responsibility for them was borne by Molotov, Malenkov, Timoshenko, and Zhukov. Only a month later did the members of the Politburo force Stalin to take the official post of People's Commissar for Defense, and on August 8 the post of Supreme Commander in Chief. Would Stalin, "foreseeing a defensive war," have taken a high leadership position, just to shun all responsibility as soon as such a war started?

We are left with the third explanation: Stalin had crushed Europe using Hitler's hands, and was preparing a sudden attack against Germany. Stalin planned to personally lead the "liberation" as the head of the government of the USSR.

The Communist Party prepared the Soviet people and army for the fact that the command to begin a "war of liberation" in Europe would be given personally by Stalin. *Pravda* wrote on August 18, 1940: "And when the Marshal of the Revolution comrade Stalin gives the signal, hundreds of thousands of pilots, navigators, [and] paratroopers will descend upon the enemy's head with all the might of their arms, the arms of socialist justice. The Soviet air force will bring happiness to mankind!" Similar statements filled the pages of *Krasnaya Zvezda* and all other Soviet newspapers and magazines.

Upon entering into office, every head of state declares his agenda. Stalin did so as well. Only Stalin gave his speech, which could be counted as an agenda, in the tight inner circle of the highest Red Army commanders, behind closed doors. On May 5, 1941, the day after his appointment as head of state, Stalin spoke in the Kremlin at a reception in honor of graduates from the military academies. The audience in the convention hall of the Great Kremlyovski Palace, where he gave the speech, consisted of graduates, professors, and teachers from sixteen academies of the Red Army and nine faculties of civilian universities, as well as representatives of the Red Army and the Fleet High Command (including the People's Commissars in both organizations and the Chief of General Staff). Stalin arrived, followed by members, actual and potential, of the Politburo (except for N. S. Khrushchev, who was holding a Central Committee plenary meeting in Kiev). The audience numbered two thousand people. Stalin spoke for forty minutes. Considering Stalin's capability for silence, forty minutes was an extraordinarily long time.

Stalin did not speak before graduates of military academies every year. There were only two such occasions. The first time had been in 1935. The Great Purge was secretly being planned when Stalin told the graduates of military academies that "cadres determine everything." The meaning of Stalin's words was simple: for great feats, the country needed good teams; good commanders would solve all problems, but without them, everything would be lost. It is doubtful that anyone at the time understood the meaning of Stalin's words. But Stalin had in mind nothing less than the complete extermination of almost all of the Communist hierarchy—state, party, military, technical, scientific, cultural, and all others. Stalin planned almost a complete transformation of the leading layer of the country. Almost everyone who listened to Stalin's speech in 1935 in two years landed in torture chambers and execution cellars.

In May 1941, Stalin for the second time spoke before graduates of military academies. Now, a more serious and dark deed was being planned, because this time Stalin's speech was given in secrecy. Stalin spoke about the situation in Europe, the war, and Germany. In his usual manner, Stalin posed questions and then answered them. Was it true that the German

army was invincible? This question was repeated in Stalin's speech three times. Stalin's answer was no. Stalin said that Germany fought under the flag of conquering other nations. Under that flag, Germany would not be successful. Stalin asked why Germany lost World War I. Because it fought on two fronts, he answered. This was a very direct hint. Stalin led his audience to a logical conclusion: Germany fought Great Britain, which was backed by the United States. If the Soviet Union opened a second front, Germany would be defeated, just as it was during World War I.

I have in my possession the unpublished memoirs of Major General of the Air Force M. V. Vodopianov, who was the very first Hero of the Soviet Union. According to Vodopianov's memoirs, the listeners correctly understood Stalin's hints, and the room was filled with applause and cheer. The General Secretary of the Comintern, the Bulgarian Communist Georgyi Dimitrov, wrote in his diary that Stalin at that moment was in an extremely good mood. During the banquet that followed his speech, Stalin twice made a toast: the first was to the commanders and the professors from the military academies, the second to the health of artillerymen, tankers, and aviators.⁵ A third toast deserved special attention. It was given by Lieutenant General A. K. Sivkov, who toasted Stalin's peaceful foreign policy. Stalin intervened:

Allow me to make a correction. A peaceful foreign policy secured peace in our country. A peaceful foreign policy is a good thing. For a while, we drew a line of defenses until we re-armed our army [and] supplied it with modern means of combat. Now, when our army has been rebuilt, our technology modernized, [now that we are] strong [enough] for combat, now we must shift from defense to offense. In conducting the defense of our country, we are compelled to act in an aggressive manner. From defense we have to shift to a military policy of offense. It is indispensable that we reform our training, our propaganda, our press to a mindset of offense. The Red Army is a modern army, and the modern army is an army of offense.⁶

On May 5, 1941, Stalin made it perfectly clear to his generals that there would be a war with Germany and that the Soviet Union would be the aggressor. It is interesting to note that a few days after the celebration in the Kremlin, Lieutenant General Sivkov, who made a toast to Stalin's peaceful foreign policy, was discharged.⁷

In March 1939, Stalin publicly accused Great Britain and France of wanting to draw all of Europe into war, while they stayed on the sidelines and would later "enter the scene with fresh forces, fight, of course, 'in the interests of peace,' and dictate their terms to the weakened participants of the war."⁸ In the same speech, Stalin for the first time declared that the international arena needed to prepare for "surprises." In August 1939, Stalin presented the first "surprise," which stunned not only the Soviet people, but the entire world, the Molotov-Ribbentrop Pact.

On September 1, 1939, a week after this pact, Germany invaded Poland. On September 17, 1939, the Red Army suddenly attacked the rear of the Polish army. The following day, the Soviet government proclaimed on the radio the cause for the attack: "Poland [has become] a convenient staging ground for any unanticipated events that might create a threat to the USSR. . . . The Soviet government can no longer hold a neutral position towards these facts. . . . In light of such a situation, the Soviet government [has] issued orders to the High

Command of the Red Army to order troops to cross the border and take under their defenses the lives and property of the population.”⁹

Here we can see the difference between Stalin and Hitler. They divided Poland and both conducted aggressive war on Polish territory. But Hitler sent his troops to Poland to “expand the living space for Germans,” while Stalin sent in the Red Army “to free the Polish people from the evil war, into which they were drawn by foolish governments, and to give the people the opportunity to lead peaceful lives.”¹⁰

Stalin’s propaganda could not conceal its joy that Germany was destroying more and more countries, governments, armies, and political parties. The Soviet leadership was ecstatic: *Pravda* declared it “[m]odern warfare in all its terrible glory!”¹¹ A description of Europe at war read: “a pile of corpses, a pornographic sight, where hyenas eat hyenas.”¹² On the same page of *Pravda*, there was a friendly telegram from Stalin to Hitler.

Suddenly, everything changed. May 1941 saw a sharp turn in all Soviet propaganda. Here is *Pravda*’s tone on the day after Stalin’s secret speech: “Beyond the borders of our Motherland burns the flame of the Second Imperialist War. All the burden of its countless calamities falls on the shoulders of the workers. The people do not want war. Their eyes are looking toward the land of socialism, which reaps the fruits of peaceful labor. They rightfully see in the armed forces of our Motherland—in the Red Army and Fleet—a reliable bulwark of peace. In the current tumultuous world situation we must be ready for all surprises.”¹³

The same tone and the same words were used in September 1939, when the Red Army suddenly attacked the rear of the Polish army and “helped the Polish people to get out of the war.”

June 13, 1941

Stalin was not one who openly declared his intentions.

—ROBERT CONQUEST, *THE GREAT TERROR*

On May 5, 1941, in the Kremlin, Stalin in essence told the graduates of the military academies to disregard official propaganda and to prepare for war.¹ On June 13, 1941, Moscow radio broadcast a rather unusual announcement of the Soviet Union Telegraph Agency (TASS). It claimed that “Germany was following the conditions of the Soviet-German pact as flawlessly as the Soviet Union,” that the rumors of an impending German attack on the USSR “were clumsily fabricated propaganda by the enemies of Germany and the USSR, interested in broadening and prolonging the war.” The following day, central Soviet newspapers published that announcement; a week later, Germany invaded the USSR. Everyone knew the author of the TASS announcement. Stalin’s characteristic style was recognized by generals in Soviet staffs, inmates in the labor camps, and Western experts.

Both the Soviet and foreign press wrote extensively about the TASS announcement. Many of those who spoke out on the subject laughed at Stalin. The TASS announcement was sometimes described as a sign of nearsightedness. However, the June 13, 1941, TASS announcement was more mysterious and inexplicable than ridiculous. Only its author is clear, while the rest is a puzzle.

The TASS announcement did not at all fit in with Stalin’s character. The man most familiar with Stalin, his personal secretary Boris Bazhanov, characterized him in the following way: “Secretive and extremely sly. . . . He possessed an extraordinary ability to remain silent, and in this respect was unique in a country where everyone spoke too much.” Following are some more descriptions. A. Avtorkhanov: “He was an implacable enemy of word inflation and excessive talking. Do not say what you are thinking.” A. Antonov-Ovseenko: “At critical moments, Stalin’s actions came before his words.” Robert Conquest, a scholar of the Stalin era, noted Stalin’s secretiveness and silence as the strongest points of his personality: “Extremely reserved and secretive. We still have to peer through the darkness of Stalin’s exceptional secrecy. . . . Stalin never said what was on his mind, even regarding political goals.”

It has been said that the ability to keep silent is much less common among people than any other talent. From that standpoint, Stalin was a genius—he knew how to keep silent. This was not only the strongest point of his character, but his most powerful weapon. With his silence, he disarmed the vigilance of his enemies; Stalin's attacks were always sudden and therefore fatal. Why then did he speak on June 13, 1941, and to a mass audience? Whom did Stalin address? Stalin's empire was highly centralized, and the mechanism of state government, especially after the Great Purge, was so perfected that any order was immediately communicated from the highest ranks to the lowest executors, and was immediately carried out. If in June 1941 Stalin had some concerns that had to be related hastily to millions of executors, why not use the perfect power structure that communicated all orders without distortion or delay? If the TASS announcement of June 13, 1941, was serious, it would have been repeated on all the secret channels. But Marshal of the Soviet Union A. M. Vassilevsky testified that after the announcement was published in print it “was not followed by any directives regarding the armed forces or reexamination of previously adopted policy.”² He also said that nothing changed in the agendas of the General Staff or the Narkomat (People's Commissariat for Defense), “and nothing was supposed to change. . . . But because no directives followed it, we quickly realized that it was irrelevant both for the armed forces and for the country as a whole.”³

Not only was the TASS announcement not repeated through secret military channels, but at the same time as the announcement came out, an order was issued to the troops in certain military districts, for example, in the Baltic district, that was in meaning and spirit quite the opposite of the TASS announcement.⁴ While the TASS announcement was broadcast on the radio, the military newspapers that were inaccessible to outsiders began to publish radically different ideas. This was reported, for instance, by Vice Admiral I. I. Azarov.⁵

There were five military districts on the Soviet Union's western borders: the First Strategic Echelon of the Red Army. Let's examine what happened around June 13, 1941, in the Kiev special district. There are many records of the events of that day. One of them is kept in the Central Archive of the Defense Ministry of the Russian Federation.⁶ This is the “Directive from the People's Commissar for Defense of the USSR and the Chief of General Staff of the Red Army to the Military Council of the Kiev special military district.” The document is dated June 13, 1941, and labeled “Top Secret, Special Importance.”

The Soviet system of secret classification had four levels of secrecy: “For Official Use Only,” “Secret,” “Top Secret,” and “Top Secret, Special Importance.” There was one more level, established by Stalin: “Top Secret, Special File.” Documents in this category were produced only in one copy and could not leave the premises of the Kremlin. “Top Secret, Special Importance” was the highest level of secrecy that could have been used beyond the Kremlin. Such a document arrived at the staff headquarters of the Kiev special military district while the radio was broadcasting the strange TASS announcement. The directive ordered the “transfer [of] all deep-rear divisions and corps commands with the corps formations to new camps closer to the state border.”

Four armies were camped in the Kiev district; behind them were five rifle corps and four motorized corps. According to the directive of June 13, 1941, all five rifle corps in the Kiev district moved to the border: the 31st, 36th, 37th, 49th, and 55th. A rifle corps three divisions strong had 966 field-guns and mortars, 2,100 machine guns, and more than 2,000

automobiles. A rifle corps had 50,000 soldiers and officers. Five corps made a quarter of a million men. The directive further demanded “to keep the transfer of troops completely secret. March at night and conduct tactical training. Take along with the troops all movable reserves of ammunition and fuel.” The document was signed by the People’s Commissar for Defense of the USSR, Marshal of the Soviet Union Timoshenko, and the Chief of General Staff Army General Zhukov. “We had to prepare all operational documentation that dealt with moving five rifle and four motorized corps from the positions of permanent location to the border zone,” wrote Bagramian (at that time a colonel and chief of operational staff in the Kiev special military district).⁷ “They took with them everything necessary for action. The move was conducted at night to secure secrecy.”⁸ Colonel General I. I. Liudovnikov (at that time a colonel and commander of the 200th Rifle Division in the 31st Corps) was one of those who executed this order: “We were ordered to begin a campaign . . . in full deployment . . . concentrated in the forests 10 to 15 km northeast of the border town Kovel. The move was to be made secretly, only at night, on forested terrain.”⁹ Marshal of the Soviet Union K. S. Moskalenko (at that time a major general of artillery and commander of the 1st Anti-Tank Brigade) remembered: “New trains kept arriving, with new men and new military equipment.”¹⁰ The official history of the Kiev military district stated: “Major General F. F. Aliabushev’s 87th Rifle Division on June 14, under pretext of training exercises, was moved to the state border.”¹¹

The moving of troops to the border under the pretext of training exercises was done on orders from Moscow. Marshal Zhukov said: “The *Narkom* [People’s Commissar] for Defense S. K. Timoshenko recommended to the commanders of military districts to conduct tactical exercises in the direction of state borders, with the effect of bringing troops closer to the regions of planned deployment for the purpose of cover.” As was previously done prior to the Finnish campaign of 1940, “covering the state borders” was a code expression meaning “preparing to cross the borders.” This recommendation was brought into effect by the districts, but with a significant difference: “a significant part of artillery did not take part in the move.”¹²

Marshal of the Soviet Union K. K. Rokossovskii (at that time Major General, commander of the 9th Motorized Corps) explains that the artillery had been ordered to the border slightly earlier.¹³

That was a brief description of the events of this day in one of the five border military districts. On the eve of the broadcast of the TASS announcement, the commander of that same Kiev special military district received another directive, with the same signatures and same level of secrecy—“Top Secret, Special Importance.” The directive of June 12, 1941, stated:

During the time period June 15 to July 10, 1941, the 16th army with the following components will arrive on the territory of the Kiev special military district: the command of the army with service personnel, 5th Mechanized Corps (13th and 17th Tank, and 109th Motorized Divisions); 57th Tank Division; 32nd Rifle Corps (46th and 152nd Rifle Divisions, 126th Corps Artillery Regiment). . . . I forbid all open telephone and telegraph communication in connection with the arrival, unloading, and placement of the new troops. Nobody except you, members of the Military Council, and the chief of staff in the district, can know about this. . . . All units arriving to the territory of the district have

been issued false names, listed below. The false name is to be used in all correspondence, including on envelopes of top secret documents.¹⁴

Four armies and nine separate corps made up the Kiev special military district. In addition, in May 1941 began the intense transfer of troops to the Kiev district from the inner regions of the country and from faraway eastern and southern borders. Bagramian described May in the Kiev district: “On May 25, the command of the 31st Rifle Corps from the Far East arrived in the district. . . . In the second half of May, we received a directive from the General Staff that ordered [us] to receive the command of the 34th Rifle Corps from the North Caucasus district, four 12,000-strong divisions and one mountain rifle division. . . . [At] the end of May, train after train arrived in the district. The Operational Department turned into a train dispatcher bureau and received all information about the incoming troops.”¹⁵

Even before June 13, 1941, troops flowed from the central regions of the Soviet Union to the five border military districts. Just three armies from among these troops required 939 railroad trains—the 22nd Army from the Ural military district, the 21st Army from the Volga military district, and the 16th Army from the Trans-Baikal military district.¹⁶ The 57th Tank Division of the 16th Army came from Mongolia. Preliminary relocation of the armies began in May 1941; other troops were moving as well. The former deputy of the People’s Commissar for State Control, I. V. Kovalev, wrote that “in May [and] early June, the transportation system of the USSR had to complete [the] transportation of nearly 800,000 reserve troops. . . . These moves had to be conducted secretly.”¹⁷

The 16th Army consisted of six divisions, among them three tank and one motorized. It had a total of thirty regiments: eleven artillery, seven tank, five motor-rifle, six rifle, and one motorcycle. The army was small in number of divisions and regiments; however it was supreme in technology, especially tanks and artillery. The 5th Mechanized Corps of the 16th Army counted 1,076 tanks.¹⁸ The 57th Separate Tank Division counted 375 tanks, and the two rifle divisions had another thirty-two tanks. In total, the 16th Army had 1,483 tanks and 560 armored cars, among them 397 heavy armored vehicles armed with cannon. The 16th Army was transferred across seven thousand kilometers. Lieutenant General M. F. Lukin commanded the army. The chief of staff of the 16th Army was Colonel M. A. Shalin—the future head of the GRU.

The relocation of the 16th Army from the region beyond Baikal to Ukraine began on May 26, 1941, and was scheduled to end on July 10. Lieutenant General P. A. Kurochkin, commander of the Trans-Baikal military district, personally supervised the dispatching of trains. We can find many testimonials to this massive railroad operation, among them the memoirs of Major General A. A. Lobachev, who at that time was a member of the military council of the 16th Army: “The chief of staff reported that an important cable came in from Moscow, concerning the 16th Army. . . . The order from Moscow proposed to relocate the 16th Army to a new place. M. F. Lukin was to immediately appear before the General Staff to receive directions, and Colonel M. A. Shalin and I were to organize the dispatch of trains.”¹⁹

Only three people—the Commander of the Army General Lukin, Lobachev, and the Chief of Staff of the 16th Army Colonel M. A. Shalin—knew that the 16th Army was being transferred west, but they did not know precisely where. All the other generals of the 16th Army were “secretly” informed that the army was headed for the Iranian border, and that the junior commanders were to be told that the reason for the transfer was training exercises; the wives of the command staff were to be told that the army was leaving for training camps.

I have interviewed hundreds of people from that generation, and they all had forebodings of the war. Where did they come from? They could not have known about Hitler's preparations. They must have seen the preparations of the Red Army and understood that war was unavoidable. General Lobachev described the extraordinary level of secrecy with which the 16th army was transferred: the trains were sent only by night and they did not stop at large and medium stations; the staff of the 16th Army was moved in cargo railroad cars with the doors and windows completely shut; at small stations, where the trains stopped, everyone was forbidden to exit the train. At that time, a passenger train covered the Trans-Siberian route in more than eleven days, while cargo trains were even slower. One could transport soldiers and officers in fully closed cars, but here we are talking about the high-ranking staff of an army. Such level of secrecy was unusual even by Soviet standards. In 1945, a flow of troops going in the opposite direction traveled on the Trans-Siberian railroad, heading for a surprise attack on Japanese troops in Manchuria and China. For the purposes of secrecy, all the generals wore officers' uniforms, with many fewer stars than they had earned, but they still traveled in passenger trains. In 1941, on the other hand, generals were being transported in cargo trains. What for?

There were five military districts in the First Strategic Echelon of the Red Army. We examined what happened in the Kiev special military district on June 13, 1941, and on the days before and after that date. The same went on in the four other military districts. On June 14, the military council of the Odessa military district received an order to create an army headquarters in Tiraspol.²⁰ This indicated the creation of the 9th Army on the Romanian border. From June 14 to June 19, the military councils of all the western border districts were directed to send out the frontline army commands to their field headquarters by June 22 and 23. Zhukov's June 19 telegram to Kirponos, the commander of the Kiev special military district, stated: "The People's Commissar of Defense has issued the following orders: the command should leave for Ternopol by June 22, 1941, leaving the subordinate district commander in Kiev. . . . The selection and transfer of front command is to be kept top secret, and the district staff personnel should be notified of said secrecy."²¹ Zhukov sent out similar telegrams to Kuznetsov, the commander of the Baltic special military district, and Pavlov, the commander of the Western special military district, on the same day. The command of the Northwestern Front, along with its district's commander, should have arrived at Panevezhis on June 22 and 23; the same should have happened on the Western front at Obuz-Lesni. This mass exodus of front and army command units was approved by Stalin on the pretext of conducting joint summer training for commanders and troops.

On June 14, the military council of the Baltic special military district approved a plan for the relocation of a row of divisions and regiments to the border zone.²² Here are some standard reports from those days. Major General S. Iovlev (at the time commander of the 64th Rifle Division of the 44th Rifle Corps, 13th Army) recounted: "On June 15, 1941, the commander of the Western special military district, General D. G. Pavlov, ordered the divisions of our corps to prepare for relocation in complete formation. . . . We were not told our destination."²³ Colonel General L. M. Sandalov (at that time colonel, chief of staff of the 4th Army of the Western special military district) remembered: "On the southern wing of the 4th Army a new division appeared—the 75th Rifle Division. It advanced from Mosyr and set up well-concealed tent camps in the forests."²⁴

Marshal of the Soviet Union K. A. Meretskov (at that time general, and the Deputy People's Commissar of Defense) said: "According to my orders, training exercises of the mechanized corps were conducted. The corps was brought out, as part of the training, to the border zone and left there. Later I told Zakharov that the corps of Major General R. I. Malinovsky was also in the area, and must also be brought to the border zone as part of training exercises."²⁵ Marshal of the Soviet Union R. I. Malinovsky (at that time major general, commander of the 48th Rifle Corps of the Odessa military district) confirmed that the order was executed: "The corps left the Kirovograd region for Beltsy on June 7, and on June 14 it was in its place. This move was disguised as extensive training exercises."²⁶ Marshal of the Soviet Union M. V. Zakharov (at the time major general, and chief of staff of the Odessa military district) recounted: "On June 15, the command of the 48th Rifle Corps, the 74th and 30th Rifle Divisions concentrated, under the guise of training, in the forests several kilometers to the east of the city of Beltsy."²⁷ The marshal noted that the commands of the corps, the units, and the 74th Rifle Division were on high alert. He said that the 16th Tank Division also participated in the "training." Marshal of the Soviet Union A. I. Eremenko (at that time commander of the 1st Army) said: "On June 20, the staff of the 13th Army received an order from the command of the Western military district to relocate from Mogilev to Novogradok."²⁸

Not only armies, corps, and divisions were transferred to the borders. We have hundreds of testimonies of much smaller units being transferred as well. Lieutenant General V. F. Zotov (at the time a major general, and chief of the engineer troops of the Baltic special military district) remembered: "The sapper battalions were mobilized according to wartime regulations . . . ten battalions, which arrived from the Far East, were completely armed."²⁹ Colonel S. F. Khvalev (at the time deputy commander of the 202nd Motorized Division of the 12th Mechanized Corps of the 8th Army) recounted: "During the night of June 18, 1941, our division left for field training."³⁰ As the colonel put it, "it so happened" that the units found themselves right at the border before the war began, in the immediate vicinity of the state frontiers.

A small fragment is known from the military order received on that same day by Colonel I. D. Cherniakhovsky, commander of a tank division in that same 12th Mechanized Corps: "Upon the receipt of this order, commander of the 28th Tank Division Colonel Cherniakhovsky is to bring all units to battle condition in accordance with plans of high alert, but without declaring a state of alert. All work is to be conducted quickly, but without noise, without panic and talk; have the necessary norms of portable and transportable reserves needed for life and battle."³¹

Trophy German documents indicate that the Germans' first encounter with the 28th Tank Division occurred near Siauliai. However, as Marshal P. P. Poluboyarov testified, the division was supposed to come out of Riga to the Soviet-German border.³² The German invasion found this division, like so many others, still on its way, because it simply did not have enough time to reach the border. The memoirs of Major I. A. Khizenko begin with the chapter "Marching toward the Border."³³ He wrote about the 80th Rifle Division of the 37th Rifle Corps: "In the evening of June 16, General Prokhorov gathered all staff personnel for a conference. He declared an order from the commander of the Kiev special military district to move the divisions to a new region of concentration. . . . There are talks that the impending march will be an unusual one."³⁴

This list is endless. Overall, the First Strategic Echelon of the Red Army had 170 tank, motorized, cavalry, and rifle divisions. Fifty-six of them were located right on the border. They could not move any farther ahead. But even of these, everything that could move was moving forward and hiding in the border forests. General I. I. Feduninsky, commander of the 15th Rifle Corps of the Fifth Army, testified that he led four regiments from the 45th and 62nd Rifle Divisions “into the woods, closer to the border.”³⁵ The remaining 114 divisions of the First Strategic Echelon stayed in the deeper territories of the western border districts, and could be moved to the border.

How many of the 114 divisions began to move toward the border in the wake of the reassuring TASS announcement from June 13, 1941? The answer is: all of them! “Between June 12 and June 15, all the western military districts were issued an order to move all deeply located divisions closer to the state borders.”³⁶

Now, let’s look at what was happening on June 13, 1941, in the inner military districts of the Soviet Union, in the far inland Urals, and in the Siberian and Altay provinces. Lieutenant General N. I. Birukov, commander of the 186th Rifle Division of the 62nd Rifle Corps of the Ural military district, recounted: “On June 13, 1941, we received an order of special importance from staff headquarters, which stated that the division had to move to a ‘new camp.’ The address of the new quarters was not given even to me, the division commander. Only when passing through Moscow did I find out that our division was to concentrate in the forests west of Idritsa.”³⁷

In peacetime, a division receives “secret,” but very rarely “top secret,” documents. A document of “special importance” can appear in a division only during wartime and only in extreme cases, when an operation of great importance is prepared. Many Soviet divisions did not receive a single document with this label of top secrecy during the four years of the war. Yet, it was peacetime when the commander of the 186th Rifle Division received a document of such an exceptionally high level of secrecy. The document’s contents were ostensibly trivial: send the division to a new camp. General Birukov, however, placed the words “new camp” in quotation marks. He and the superior officials who had sent the document knew perfectly well that they were not talking of a “new camp,” but of something much more serious.

All divisions in the Ural military district received similar orders. Official records of the district clearly fixed the date: “The 112th Rifle Division was the first to begin loading. On the morning of June 13, the train left the small railroad station. . . . Other trains followed. Then began the loading of units from the 98th, 153rd, and 186th Rifle Divisions.”³⁸ The 170th and the 174th Rifle Divisions, artillery, sapper, and anti-tank units followed. New administrations were created for operating the Ural divisions, while the old ones were submitted to the command of the staff of the new 22nd Army.

This mass of staffs and troops moved from the Urals toward the Belorussian forests under the cover of the reassuring TASS announcement. The 22nd Army was not alone. General S. M. Shtemenko wrote: “Right before the beginning of the war, under the strictest secrecy, additional forces began to gather in the border forests. Five armies were transferred from the depth of the country toward the borders.”³⁹ General S. P. Ivanov, who in the early 1970s headed a group of experts researching this issue, added: “At the same time, three more armies were preparing for relocation.”⁴⁰ All these armies would form the Second Strategic Echelon of the Red Army.

Why didn't all eight armies move simultaneously? In February, March, April, and May, a grandiose secret transfer of Soviet troops—from the inner regions to the borders—was conducted. It was concluded in time, but thousands of railroad cars had to return thousands of kilometers back inland. Therefore, on June 13, when the new, giant, secret movement of troops began, there were not enough cars for all the armies. The Second Strategic Echelon contained seventy-seven tank, motorized, and rifle divisions, not counting tens of separate regiments and hundreds of separate battalions. They all began their secret movement toward the western borders of the USSR under the cover of the TASS announcement.⁴¹ To the 114 divisions of the First Strategic Echelon, we must add seventy-seven divisions of the Second Strategic Echelon that began to move toward the western borders from the central regions of the country, from Siberia, and even from the Far East.

Everything that Soviet officers, generals, and marshals wrote about in their memoirs was fully confirmed by reports of German intelligence to their commanders in the spring and early summer of 1941: the Red Army was heading in giant surges toward the western borders. Many independent sources confirm the same fact. The massive Red Army movement toward the western borders was felt even in Soviet prisons. G. Ozerov, one of the deputies of airplane designer A. N. Tupolev, at that time was in prison, together with Tupolev and his entire design bureau. They received an order to create the best dive-bomber in the world. They were told that if they designed the plane, they would be let out of prison. They designed behind bars, but had constant contact with engineers from airplane and automobile factories, and with officials from the People's Commissariat of Aviation Industry. Former inmate Ozerov recounted: "Inhabitants of dachas along the Belorussian and Vindavsk roads complain that they cannot sleep at night [because] trains with tanks and cannon are being herded through!"⁴²

Thus, "right before the war, in accordance with orders from the General Staff of the Red Army, certain units of the western special military district began to move to the state border."⁴³ Having crushed the First Strategic Echelon and broken through its defenses, the first German units suddenly stumbled across new divisions, corps, and armies (for example, the 16th Army near Shepetovka in late June), about whose existence the German commanders had no idea. The plan for the blitzkrieg was built on calculations of lightning-speed destruction of the Soviet troops right along the borders. But having completed this plan, the German army discovered a new wall of armies, which was coming out of the Northern Caucasus, Volga, the Urals, Siberia, Trans-Baikal, and the Far East.

Thousands of railroad cars are needed for the transfer of even one army. They have to be sent to the station of departure, loaded with the army, heavy weapons, and reserves, and then cross thousands of kilometers. If the German troops encountered Siberian, Ural, and Trans-Baikal armies at the end of June, then their transfer to the west had not begun on June 22, but earlier.

The movement of the Soviet navy began at the same time as the movement of ground troops. Before the war, the Soviet Baltic fleet left the eastern part of the Gulf of Finland, heading west.⁴⁴ The fleet's objective was to act on the naval communication lines of the enemy.⁴⁵

Simultaneously with the transfer of ground troops and navy, an intensive relocation of aviation was taking place. During the dark early hours of the day, aviation divisions and regiments were transferred in small units to air bases, some of which were less than ten kilometers from the border. In addition to operational air force units, a rigorous transfer of the newest

airplanes to these units was under way. Colonel General L. M. Sandalov recounted: "From June 15, we began to receive new combat technology. Kobrinsky and Pruzhansky fighter regiments received the Iak-1 fighters, armed with cannon; the ground attack regiment got the Il-2 plane, the bomber regiments [got] the Pe-2."⁴⁶

Fighter regiments of that time had sixty-two planes each, ground attack regiments had sixty-three, and bomber regiments had sixty. Consequently, a single division (the 10th Mixed Air Force) was awaiting the arrival of 247 new planes. The general reported that the division did in fact begin to receive new technology, but old planes remained in the division. The division turned into a giant combat organism, comprised of several hundred planes. This process occurred everywhere. For example, the nearby 9th Mixed Air Force Division also received 262 new MiG-1s and MiG-3s, as well as several tens of Pe-2s and Il-2s.⁴⁷ On the morning of June 22, that same western front got an order to receive 99 MiG-3s at the Orsha airfield.⁴⁸ If they were to be received on the morning of June 22, the planes evidently were ready to be shipped out on the evening of June 21. Chief Marshal of Aviation A. A. Novikov reported that on June 21 the Northern Front, where he was commander of the air force, received a trainload of MiG-3 fighters.⁴⁹

Besides the fighter planes, a mighty stream of tanks, artillery, ammunition, and fuel was also flowing in. At dawn on June 22, a trainload of heavy artillery regiments came into the Siauliai station.⁵⁰ There were endless rows of trains full of ammunition. The *Krasnaya Zvezda* noted: "On the evening of June 21, 1941, the supervisor of the railroad station at Liepaja was told: 'Receive a special train. It carries ammunition. It must be sent to its destination as a matter of priority.'"⁵¹ Liepaja at that time was very close to the border, but the train was in transit, meaning it was going to the border lines.

Railroad cars on all fronts were full of ammunition, which was usually done in preparation for an offensive of great depth. In a defensive war, it was easier and cheaper to store ammunition in previously prepared storage depots. Having used up all the ammunition from one storage depot, the troops easily retreated to another, where ammunition awaited them, then to a third, and so on. But before an invasion, ammunition was loaded onto mobile transport, which was very risky and expensive. For example, the southwestern front had 1,500 railroad cars of ammunition at the small Kalinovka station alone.⁵² Colonel General I. I. Volkotrubenko reported that in 1941, after the German attack, the western front alone lost 4,216 railroad cars of ammunition.⁵³ There were five fronts, and it is incredible how much ammunition was stored on all fronts. Some of it fell into German hands; some of it was successfully rescued. In the middle of June, that incredible number of troops and ammunition—under the cover of the TASS announcement—was rolling toward the German borders in railroad cars.

Marshal of the Soviet Union S. K. Kurkotkin reported that in the beginning of June the "Soviet government, following a proposal by the General Staff, approved a plan to move 100,000 tons of fuel from the inland regions of the country."⁵⁴ In addition, "about 8,500 railroad cisterns with fuel [were] amassed at railroad intersections."⁵⁵ If the smallest 20-ton cisterns were being used, this would have meant much more than 100,000 tons. The most frequently used cistern in 1941 was the 62-ton. These 8,500 containers were at the stations waiting to be unloaded in the first days of the war. We also have to take into account all that was destroyed by enemy air raids at the railroad stations in the first minutes and hours of the

war. Colonel General I. V. Boldin, deputy commander of the Western Front, related that the 10th Army (the most powerful army on the Western Front) had sufficient supplies of fuel in storage and in railroad containers, but lost everything in the first minutes of the war.⁵⁶ On the eve of the war, this mass of cisterns was moving toward the borders, together with troops, military equipment, weapons, and ammunition.

June 13, 1941, marked the beginning of the biggest organized movement of troops, arms, ammunition, and other military supplies in history. Now is the right time to look once again at the TASS announcement of June 13. Many historians for some reason focus their attention on the introduction of this announcement, which speaks of German intentions. But the TASS announcement also speaks of Soviet intentions, and the most interesting information is contained there: "Rumors that the USSR is preparing for war against Germany are false and provocative. . . . The gathering of air forces and reserves of the Red Army and the impending maneuvers have as their objective nothing but [the] training of reserves and [the] testing of railroad functioning; they are conducted, as is known, yearly, so to imagine that these events are hostile to Germany is ridiculous." Comparing the announcement with what occurred in reality, we find a big discrepancy between words and deeds.

The TASS announcement talked about the "testing of railroad functioning." This is questionable. The movement of Soviet troops began in February, in March it intensified, in April and May it reached grandiose proportions, and starting on June 13, 1941, it reached an all-encompassing character. The only divisions that did not participate in the move were those already at the border, those that remained in the Far East, and those that were preparing to invade Iran. The full concentration of Soviet troops along the German border was planned for July 10.⁵⁷ For almost half a year, railroad transportation, the main means of transportation in the country, was paralyzed by secret troop transfers. In the first half of 1941, the government plan for industry was only fulfilled for the military requirements. The main reason was that transportation was almost exclusively used for secret military transfers. The second reason was the secret mobilization of the male population to the newly formed armies. The disruption of the government plan could hardly be called "testing."

The TASS announcement described it as "usual training," but Soviet marshals, generals, and admirals contradicted that claim. Major General S. Iovlev said: "The unusual aspect of the gatherings, not foreseen by plans of war readiness, alerted people."⁵⁸ Vice Admiral I. I. Azarov remembered: "Usually, training was conducted closer to the fall, but here they were beginning in the middle of the summer."⁵⁹ Colonel General I. I. Ludnikov said: "Usually, reserves are called in after the crops have been harvested. . . . In 1941, this rule was broken."⁶⁰

Major General M. I. Kazakov at that time was at the General Staff headquarters. There, he encountered the commander of the 16th Army, Lieutenant General M. F. Lukin, and other generals. Their armies were secretly being transferred by train; the commanders of the armies moved ahead of their troops and arrived in Moscow by airplane. In Moscow, they received their last instructions. General Kazakov said: "It was clear that it was not maneuvers they were going to. It was something else."⁶¹

Did Stalin have a premonition and concentrate troops along the borders for defense? That explanation is implausible. The massive operation described above couldn't be defensive. Troops preparing for defense dig themselves into the ground. They take over the largest fields that the enemy will have to cross, close off roads, establish barbwire barriers, dig anti-tank

trenches, and prepare covers behind the barricades. The Red Army did nothing of the kind. However, Soviet divisions, armies, and corps destroyed all previously constructed defensive structures. Troops were concentrated not behind water barriers, in a fashion convenient for defense, but in front of them, which was convenient for offense. Soviet troops did not take over vast fields that the enemy would need to cross, but hid in the woods, just like the German troops preparing for invasion. Perhaps all this was just a demonstration of might? Of course not—a demonstration has to be visible to the enemy. The Red Army, on the contrary, tried to hide its preparations. The TASS announcement was not written to scare Germany, but to allay its fears.

Words and Deeds

When trying to put together a clear picture of Hitler's National Socialism and Stalin's international socialism, we find surprising similarities not only in slogans, songs, and ideologies, but also in events. In the history of German National Socialism there was a moment very similar in spirit and meaning to the TASS Announcement of June 13, 1941. A year before, on May 8, 1940, German radio announced that the talk of two German armies being transferred to the border with Holland was a "ridiculous rumor," being circulated by "British inciters of war." After this, the German armies crushed and occupied Belgium, Holland, Luxemburg, and the greater part of France. The German radio announcement of May 8, 1940, and the TASS announcement of June 13, 1941, match almost word for word. Hitler did not believe Stalin's TASS announcement because he had himself disguised the preparations for a sudden attack using the same exact tricks.

The TASS announcement of June 13, 1941, was meant to stop rumors of imminent war between the USSR and Germany. Stalin decisively fought these rumors. The same problem stood before Hitler at the same time. Preparations for war are difficult to hide. People see them and express all sorts of hypotheses. On April 24, the German naval attaché in Moscow sent a warning report to Berlin, stating that he was combating "obviously ridiculous rumors of an impending German-Soviet war."¹ On May 2, Ambassador Schulenburg reported that he was also fighting rumors, but "everybody who comes to Moscow from Germany brings not just these rumors, but can even support them with evidence."² On May 24, the head of the foreign press department of the Ministry of Propaganda in Germany, Karl Bemer, in a drunken state said something undesirable about relations with the Soviet Union. He was arrested immediately. Hitler personally took care of this case and, according to Goebbels, gave this event "too much consideration." On June 13, 1941, on the day of the TASS announcement stating that there would be no war, Karl Bemer stood trial before the People's Court and said that his speech had been a drunken mistake: of course, there would be no war between Germany and the Soviet Union!

Just to make sure no doubts about this remained at home or abroad, on June 15, 1941, Ribbentrop, the German minister of foreign affairs, sent top secret telegrams to his ambas-

sadors: "There are plans [for] important talks with Moscow. [The] Fuehrer is going to sort out relations and raise new demands. Ambassadors must, in complete secrecy, relay this to the governments of the nations in which they are stationed. For example, the German ambassador in Budapest had to relay this piece of information, as a special secret, to the Hungarian president.³ The German leaders undertook a preplanned program of disinformation toward their own troops, their diplomats, and their military allies. The Soviet high command was doing the exact same thing.

Many people saw the transfer of Soviet troops to the borders. However, every person saw only a part of what was happening. Very few individuals conceived of its true scope. German military intelligence knew that a development of the might of the Red Army was occurring, but it only saw the first strategic echelon, without having any idea that there was a second one. Many Soviet marshals and generals, excluding those who were directly involved in the planning and commanding of the troop movement, also could not conceive of its true scope and, consequently, its meaning. Precisely for this reason, later on many of them freely talked about this transfer of troops. Their lack of knowledge of the whole situation and the true scale of concentration of Soviet troops is not at all coincidental; Stalin undertook draconian measures to keep all this secret. Stalin's TASS announcement was one of those measures. The fact of the transfer itself was impossible to hide, but the most important information—its size and its purpose—Stalin successfully hid from the entire nation, and even from future generations.

Colonel General of the Air Force A. S. Yakovlev (at the time personal advisor to Stalin) testifies that "at the end of May or beginning of June" a conference was held in the Kremlin regarding questions of concealment.⁴ Troops were told that they were going to training camps, although the higher command understood that they were not talking of training. In a defensive war or before its start there is no need to fool the troops—officers and soldiers are given a clear and precise objective: here is your line, do not take a single step back! Die here, but do not let the enemy through! If a defensive operation was being prepared, why not tell the troops: yes, comrades, the situation is tense, anything can happen, dig foxholes and sit in them. If troops were indeed being sent to dig foxholes, it would have made no difference whether the objective of their move was told after arrival or upon departure. But Soviet officers were not told so upon arrival or departure. A different task was set before them, which was concealed then and is still concealed now.

In order to understand the level of secrecy of the troop transfers, I will give one example: a district commander and his chief of staff did not know that some other troops were gathering on their territory. Marshal of the Soviet Union M.V. Zakharov tells us:

In the beginning of June, Colonel P. I. Rumiantsev, the chief of military communications of the Odessa military district, came to me, at that time chief of staff in Odessa, to my cabinet, and secretly reported that during the last few days *Annushkas* had been going through the Znamenka station from the direction of Rostov and were being unloaded in the Cherkassy region. *Annushka* is a term used in military communication to denote a division. Two days later, I received a cable from Cherkassy signed by the deputy commander of the Northern Caucasus military district, M. A. Reiter, in which he asked permission for the temporary use of several barracks of storage space in our district—to place materials arriving from the Northern Caucasus into the district. Because the staff of the Odessa military district was not informed about concentration of troops there, I contacted, using

high-frequency lines, the Operational Directorate of the General Staff.⁵ The deputy chief of the directorate, A. F. Anisov, came to the telephone. After telling him about the cable I received from Reiter, I asked for clarification. Anisov replied that Reiter's cable was to be immediately destroyed, that Reiter would receive the necessary orders from the General Staff, while the staff of the district should not get involved in this matter.⁶

The commander of the Odessa district, Colonel General I. T. Cherevichenko also knew nothing of the *Annushkas*.

Some Soviet marshals, including Zhukov, said that twenty-eight rifle divisions were moving out from the deeper inland territories of the country. This is true, but it is not the entire truth. Marshal A. M. Vassilevsky stressed that twenty-eight divisions only "laid the foundation for the execution of the troop gathering plan."⁷ Twenty-eight divisions were only the beginning. We know that there was a continuation, which surpassed the beginning, but Marshal Vassilevsky, after having spoken a little, grew silent and did not name concrete figures. If we compile all the data contained in all present-day military history works, we will find out that in May and June of 1941 seven armies were moved from the interior military districts to the western borders.⁸ Besides that, several independent corps were on their way west, including the 9th Special Rifle Corps, the 31st Rifle Corps, and the 27th Mechanized Corps. The total number of transferred divisions was seventy-seven, plus there was a huge number of independent combat and auxiliary formations.

On June 13, 1941, Molotov summoned the German ambassador and related to him the text of the TASS announcement.⁹ The announcement stated that Germany did not want to attack the USSR, and the USSR did not want to attack Germany, but "enemies of Germany and the USSR interested in unleashing and broadening war" were trying to make them quarrel and were spreading provocations and rumors of imminent war. In the announcement, these "enemy forces" are listed by name: "the British ambassador in Moscow, Mr. Kripps," "London," and "the English press." Our exploration of the day would not be complete if we do not turn to London on June 13, 1941.

It is reasonable to suppose that on June 13 there was a meeting in London between the Soviet ambassador I. M. Maysky and the British foreign minister Anthony Eden. Indeed, the meeting was held, and, surprisingly, in a friendly atmosphere. Discussion revolved around a serious issue: measures Britain would take to aid the Red Army "if in the near future a war between the USSR and Germany begins." Among other specific measures were military operations by the British air force, the transfer of military supplies, and the coordination of command between the two countries.¹⁰

On June 13, 1941, Stalin's diplomats were laying the foundation of what would soon be called the "Anti-Hitler Coalition." From the British point of view, there was nothing wrong with this picture: at that moment, Britain was involved in a war against Hitler, and had full rights to talk with anyone about joint efforts against him. But the Soviet Union had signed a pact of non-aggression with Germany, and immediately after that an agreement of friendship. If Soviet leadership thought that these documents no longer suited the situation at hand, they should have had them annulled. But Stalin did not do this; he assured Hitler of friendship and in the TASS announcement denounced the British ambassador and press for "wanting to broaden the war." At the same time, talks in London were under way concerning a military alliance with Germany's enemy, and about specific military measures against Germany.

It is surprising that at the talks in London both sides used the phrase “if war begins” instead of “if Germany attacks.” In other words, those talking did not exclude the possibility that the war would start not with German aggression, but in some other way. It is interesting that at the talks in London, the USSR was listed first: “if a war between the USSR and Germany occurs.” The same words were used in the TASS announcement: “rumors of imminent war between the USSR and Germany.” Why not say the opposite, between Germany and the USSR, if one supposes that Germany will be the aggressor?

Red Army, Black Gulag Uniforms

Immediately after the partition of Poland in the fall of 1939, a large number of Soviet troops were transferred from their permanent stations to the new borders. But the new territories were not adapted to the permanent deployment of large quantities of troops, especially troops with a lot of military equipment.

The *History of the Second World War* tells us: “The troops in [the] western border districts experienced many difficulties. Everything had to be built and equipped anew: bases and supply points, airfields, systems of roads, lines of communication.”¹ The official history of the Byelorussian military district says: “Movement of units from the district to western parts of Byelorussia caused considerable difficulties. . . . The personnel of the 3rd, 10th and 4th armies . . . were busy with repair work and building barracks, storages, [and] camps, [and] furnishing training sites, shooting ranges, and tank depots. The troops were under considerable strain.”² Colonel General L. M. Sandalov: “The movement of district troops here encountered huge difficulties. The barracks were miserably few. . . . For troops not provided with barracks, dugouts were being built.”³

But troops kept arriving. General Sandalov says that in order to house all the troops in 1939–40, storages, barracks, and any kind of space was being used. “A large amount of troops concentrated in Brest. . . . Four-tiered bunks were set up on the lower floors of the barracks.”⁴ Lieutenant General V. N. Kurdumov, the head of the Battle Training Directorate of the Red Army, had said in December 1940 at a meeting of the command staff that, in the new regions, troops often were forced to spend their time doing housework instead of military training.⁵ At the same meeting Lieutenant General I. N. Fedorenko, the head of the Automobile-Tank Directorate, said that almost all tank units in 1939–40 changed their positions, sometimes up to three or four times. As a result, “more than half of the units that moved to new places had no training ranges.”⁶ At the cost of tremendous effort, in 1939 and 1940 the troops of the First Strategic Echelon were set up and quartered. But from February 1941, at first slowly, then faster and faster, the seven armies of the Second Strategic Echelon began pouring into the same areas. At that moment, a change occurred that has not been

noticed by historians: Soviet troops stopped caring about how they would spend the coming winter. The troops of the First Strategic Echelon abandoned their dugouts and unfinished barracks and entered the border zone. We are talking of all the troops.⁷

Troops of the Second Strategic Echelon, moving from within the country, did not use the unfinished barracks and camps abandoned by the First Strategic Echelon. The arriving troops were not planning to spend the winter in these locations, and made no preparations for winter. They were not making dugouts or building training facilities and shooting ranges; they were not even digging foxholes.

Many official documents and memoirs of Soviet generals and marshals attest to the fact that now the armies were lodged in tents. In March 1941, the 118th Division of the 16th Rifle Corps of the 11th Army was formed in the Baltic region. In May, reserves arrived. The division put up a temporary summer camp made of tents in the Kozlovo Ruda region (45 to 50 km from the state border). Safe under the cover of the TASS announcement, the division abandoned this camp and headed for the border. Any attempt to find even a hint of preparations for winter is doomed to fail—the division was not preparing to spend the winter here. Right next to it moved the 28th Tank Division, and the picture was the same. In all tank divisions, all newly formed rifle divisions, the attitude toward winter changed—nobody feared winter any longer. Marshal of the Soviet Union K. S. Moskalenko (at the time Major General, commander of the 1st Motorized Artillery Anti-Tank Brigade of the Main Command Reserve) received an assignment from the commander of the 5th Army, Major General M. I. Potapov: “Your brigade began to form here. You will occupy that area of forest [and] set up a camp.” A powerful brigade of over six thousand men, with over a hundred heavy guns up to 85 mm in caliber, set up camp in three days. After this, intense battle training began: eight to ten hours a day, not counting night training, homework, maintenance of weapons, and weapon training.⁸

Where were they planning to spend the winter? Staying in tents in the Russian winter? Wasn't Central and Western Europe more comfortable?

Major General A. Zaporozhchenko gives the following description: “The final phase of the strategic deployment was the secret movement of attack groups to staging grounds for invasion. It was carried out during the course of several nights before the attack. The cover of the movement was organized by reinforced battalions that had previously been moved to the border and, before the arrival of the main forces, controlled the areas of the front pre-assigned for the divisions. Transfer of aviation began in the last days of May and ended by June 18. Fighter and ground-attack planes concentrated at air bases up to 40 km from the border, and the bombers were no further than 180 km.”⁹

In this description, we can be surprised only by the date of June 18. Soviet aviation did not complete its relocation then; it only started it on June 13 under the cover of the TASS announcement. Why is the general mentioning June 18? The thing is, he is talking not of the Red Army, but of the German *Wehrmacht*, where the same exact thing was occurring—troops were also moving toward the borders at night. Reinforced battalions were sent ahead. Arriving divisions took predesignated areas for attack, or simply put, hid in the forests. The actions of the two armies are mirror images of each other. The only difference is the dates. At first, the Soviet troops were ahead, but then Hitler got two weeks ahead of them—he had fewer troops, and they had less distance to cover. It is interesting that in the beginning of June the German army was in a very unfavorable position: it had troops in railroad trains. Guns

were in one train, shells in another. Battalions were unloaded where there were no staffs, staffs where there were no troops. There were no communication lines, since for safety reasons usage of many radio frequencies was banned. German troops also did not prepare dugouts and build training ranges.

But the most important similarity was the huge quantity of supplies, troops, aviation, hospitals, staffs, air bases—all this right on the Soviet borders, and very few people knew the plan of action, which was kept in extreme secrecy. All that we see in the Red Army and discount as stupidity was done, two weeks prior to that, in the German *Wehrmacht*. This is not stupidity, but preparation for invasion.

What was supposed to happen after the gathering of the Second Strategic Echelon of Soviet troops in the western districts of the country? The answer to this question was given long before the beginning of World War II. General V. Sikorsky: "Strategic waiting cannot last after all forces have been mobilized and concentration of troops achieved."¹⁰ This was said by the Chief of the General Staff of the Polish army, in the 1936 book *The Future War*. However, according to a decision of the Soviet General Staff, the book was published in Moscow for Soviet commanders. The book was published because Soviet military science had earlier reached the same conclusion: "In modern conditions the worst idea in the beginning stages of the war is to attempt to use a tactic of waiting."¹¹

The advancement of the Second Strategic Echelon was not a reaction to Hitler's actions. The creation of the Second Strategic Echelon began before the massive movements of German troops to the Soviet borders. The movement of the Second Strategic Echelon was a railroad operation that required lengthy preparations and extensive planning. Marshal S. K. Kurkotkin said that the General Staff transferred all necessary documents concerning the troop movements to the People's Commissariat of Transportation on February 21, 1941.¹² But the General Staff also needed time to meticulously prepare those documents; they needed to issue to the railroads precise orders about when, where, and what transport should be supplied, how to conceal loading and transfer, what routes to use, where to prepare areas for unloading the troops. In order to prepare all this, the General Staff had to determine exactly what troops had to appear, and where and at what time. This means that the decision to create the Second Strategic Echelon and the beginning of planning its movement and use for battle must have come sometime earlier.

The process of creating troop formations in inner districts and moving them to western border districts began on August 19, 1939. It originated with a decision by the Politburo; it was never stopped, and slowly gained momentum. Here is just one example: the Ural military district. At the end of August 1939 the 85th Division was formed; in September 1939, the 159th Division was formed. We see the 85th Division on June 21, 1941, right at the German borders in the region of Augustow, where the NKVD is cutting through barbed wire. The 159th Division we find right on the border as well, in the Rava-Russkaya region, in the 6th Army. In the same month of September 1939, in the same Ural district, the 125th and 128th Rifle Divisions were created, and each of them we can later find on the German borders. Moreover, according to Soviet sources, the 125th was "on the immediate borders" of East Prussia. The Ural district formed many other regiments and divisions, and all of them quietly crawled closer to the borders.

After the German invasion, the Second Strategic Echelon (as well as the first) was used for defense. But that does not at all mean that it was created for that purpose. General M. I.

Kazakov says of the second echelon: "After the beginning of the war, radical changes to the plans for its use had to be made."¹³ Major General V. Zemskov speaks more precisely: "We were forced to use these reserves not for attack, as planned, but for defense."¹⁴ General S. P. Ivanov: "If the troops of the First Strategic Echelon had been successful in . . . transferring the battle action to the enemy's territory before the deployment of the main forces, the Second Strategic Echelon had to fortify the efforts of the first echelon and develop a counterstrike according to the overall strategic plan."¹⁵ The term "counterstrike" should not add confusion. The Red Army always delivered a "counterstrike."

Lieutenant General S. A. Kalinin talks about the mood in the Second Strategic Echelon. Before the beginning of the secret movement west, he prepared the troops of the Siberian military district (later transformed into the 24th Army) for action. During the course of training, the general heard opinions from junior officers: "We probably won't need fortifications either. After all, we are getting ready not for defense, but for invasion, we will hit the enemy on his territory."¹⁶ All armies were prepared to fight "on enemy territory." The commander of the 16th Army of the Second Strategic Echelon, Lieutenant General M. F. Lukin, does not say exactly on what territory he planned to use the 16th Army that was under his command in 1941. But in any case, it was not Soviet territory: "We planned to fight on enemy territory."¹⁷ On the same page of the Soviet military journal where Lukin was quoted, Marshal A. M. Vassilevsky stresses that we should believe Lukin: "[T]here is much harsh truth in his words." Vassilevsky himself was a master at fighting "on enemy territory." It was he who carried out a surprise attack on Japanese troops in Manchuria in 1945, demonstrating the best example of how one has to deliver a sudden treacherous blow to the enemy's rear while he is occupied by war on other fronts.

From experience, as well as from theory, the Soviet High Command knew that not even one division could be left for a winter in the woods, unprepared. A soldier can spend the winter under any conditions—that was not the problem. The problem was that near the western borders there were no shooting ranges, no training camps, no tank depots, and no conditions for battle training. Troops must either immediately enter combat, or inevitable degradation of the level of battle readiness would ensue. The Soviet High Command knew that the culprits would be found, and they knew what the fate of the culprits would be—yet they took practically the entire Red Army into places where there were no conditions for battle training. The Soviet High Command did not fear Stalin's ire, because the move forward did not endanger the troops' combat readiness. Stationing them under such poor conditions was planned for a very short time only, after which the Red Army would attack westward.

Stalin had no choice. He could not turn his armies around. Many armies and corps created in the first half of 1941 had nowhere to turn back to. Another troop transfer would have required many more months, would have paralyzed the entire railroad system, and would have meant economic catastrophe. Moreover, what sense does it make first to spend half a year gathering troops, and then half a year dispersing them? Even if, after a full concentration, an immediate dispersion had begun, even then the process could not have been finished before the arrival of winter. Besides, Stalin kept the process of creation and transfer to the west of the entire Second Strategic Echelon strictly secret. Could he have counted on full secrecy, if he left these armies for several weeks in the border forests?

If the Red Army could not turn back and could not stay in the border regions for long, what was left for it to do? In order to answer this question one needs to bring up the

opinion of Stalin: "In the condition when we are surrounded by enemies, a sudden attack from our side, an unanticipated maneuver, quickness, decides everything."¹⁸ In every grandiose process, there is a critical moment, after which events cannot be turned back. For the Soviet Union, this moment came on June 13, 1941. After this day, war for the Soviet Union became inevitable, and it was to be in the summer of 1941, regardless of Hitler's actions.

In the Second Strategic Echelon, which Stalin was secretly transferring to the borders, there were entire divisions, sometimes even corps, of soldiers dressed in old black uniforms. There were enough of these soldiers for the German military intelligence to notice and unofficially dub these divisions and corps "black." One example was the 69th Rifle Corps of the 20th Army. This corps was not the only one. The 63rd Corps of the 21st Army also figures in German documents as the "black corps." The commander of the 63rd Rifle Corps was *Komkor* (Corps Commander) L. G. Petrovsky. During the war *Komkor* Petrovsky fought with dignity and courage, proving his ability as a great strategist in battle. On July 31, 1941, he received the rank of lieutenant general and was promoted to command the 21st Army while the 63rd Rifle Corps, after heavy fighting, was encircled by the enemy. Stalin ordered him to leave the 63rd Corps encircled and to take command of the 21st Army. Petrovsky asked to delay the order of entering his post as army commander for a couple days, and the plane sent for him returned with critically wounded soldiers on board. Petrovsky brought his "black corps" out of encirclement and once again returned to the rear of the enemy, in order to bring another division out of encirclement, the 154th Rifle Division (under the command of Major General S. Fokanov). During the breakout from encirclement, Petrovsky was fatally wounded. German troops, upon finding and recognizing Petrovsky's body on the battlefield, gave the Soviet general a funeral with all military honors. A huge cross was placed on his tomb, with an inscription in German that read: "Lieutenant General Petrovsky, commander of the 'black corps.'"

The unusual black uniform was noted by the German intelligence in other units of the Second Strategic Echelon as well. When this uniform dominated over the usual green one, then regiments, divisions, and sometimes entire corps received the name "black." The 24th Army of the Second Strategic Echelon, secretly advancing out of Siberia, was no exception. During the fighting, several of its corps and divisions got called "black" by the Germans. By the end of June, the trains of this army stretched across thousands of kilometers. At that time Lieutenant General S. A. Kalinin, the commander of the army, was already in Moscow, working on the problem of how to feed the 24th Army. After the first few battles, the 24th Army found itself in the right hands: Major General of the NKVD Constantin Rakutin took the command. Lieutenant General S. A. Kalinin returned to Siberia. Kalinin, on Stalin's orders, formed ten new divisions. He said: "Units were formed in locations that previously had no military units at all. I began my work by visiting these locations. My first flight was to one of the towns in Siberia. Some years before the war, in the dense forests there, a village of barracks was built for lumberjacks. We used it for housing the units of the forming armies. The village was surrounded almost from all sides by impenetrable taiga."¹⁹ Everything about "barrack villages for lumberjacks" can be found in the three volumes of Alexander Solzhenitsyn's book *The Gulag Archipelago*. The result was that ten new divisions (over 130,000 men) assembled in the Siberian military district not in locations previously established for military units, but in "barrack villages." These people were the Soviet prisoners. That is why the regiments and divisions of this army and other armies of the Second Strategic Echelon were clothed in black:

“lumberjacks” were frequently not even issued military uniforms. That was why Stalin had replaced the commander of the 24th Army with the “chekist” Rakutin.²⁰

The armies of the Second Strategic Echelon, which included the “black” divisions and corps, began forming in June 1941. These divisions and corps began their movement west on June 13, 1941. German troops encountered the “black” divisions and corps in early July 1941. Every army of the Second Strategic Echelon was created specifically for the purpose of a surprise arrival at the western borders. Each army was located on a major railroad route. Each was formed in the vicinity of concentration camps: men there were used to order, didn’t ask for much, and it was easier to take them out of the camps than out of the villages—all were already gathered in one place, organized into brigades, and, most importantly, it was impossible to take men out of the villages without stirring rumors about mobilization and war. Stalin needed everything to proceed quietly, without rumors. That was why he wrote the TASS announcement. That was why men were in due time taken to concentration camps, trained and disciplined, and then sent to the front without fuss. If in early July the German army met divisions and corps filled with inmates, in the armies coming from the faraway Urals and from the Siberian and Trans-Baikal provinces, it means that Stalin handed weapons to the inmates before June 22, 1941. The main question that German command had to answer was: If we do not attack, what will Stalin do? Take away the weapons from the inmates, return them to the GULAG, or send them home? Or perhaps Stalin had some other options for using the armed inmates that were secretly gathering at the German borders?

Military Alignment

Hitler, herded into a corner and full of fear, in June 1941 decided to turn east, and attack the Soviet Union.

—BASIL HENRY LIDDELL HART

In September 1939, as a result of the Red Army's "war of liberation" in Poland, the new western border of the Soviet Union advanced in such a way that the so-called Belostok bulge formed in Byelorussia—a powerful wedge that, like a ship's bow, broke into the territory occupied by Germany. The same thing happened in the Lvov region—there, another powerful wedge of Soviet territory formed. The Belostok and Lvov bulges were like two Soviet peninsulas in the German sea. Basic military logic dictated: if the Red Army intended to defend itself, it could not keep troops in the Belostok and Lvov bulges. Already, in peacetime, enemy troops surrounded the Soviet army on three sides in the bulges. The Soviet flanks were open and vulnerable. A sudden and decisive German attack on the flanks in these bulges would have cut off the best sections of the Red Army from the main forces and supply bases. In the event of an enemy invasion, such an alignment of Soviet troops inevitably and immediately would have led to catastrophe.

That is exactly what happened in 1941. Before the German invasion into the territory of the Kiev military district, the most powerful Soviet front was deployed: the Southwestern Front. The three most powerful armies of that front were in the Lvov bulge. In peacetime, these three armies were already almost surrounded. Hitler only had to shut the trap on them. On June 22, the very weak 1st German Tank Group hit Lutsk, Rovno, and Berdichev, quickly cutting off all three Soviet armies in the Lvov bulge—the 12th (mountain), 6th, and 26th. The 1st Tank Group, faced with open, unprotected operational space, immediately went through the Soviet rear, crushing air bases, staffs, and hospitals. Here, in the rear, they found tremendous quantities of Soviet weapons, fuel, ammunition, foodstuffs, and medical supplies. The Germans seized truly remarkable trophies. The three Soviet armies in the Lvov bulge were left with a problem that had two solutions, both of which were catastrophic: either

remain in the trap and wait for the 1st Tank Group to completely lock the encirclement, or run to the east, abandoning everything that cannot be carried. They ran. Soon, they were left without fuel and ammunition. The entire Soviet Southwestern Front crumbled from one rather weak blow. But that was not all: this same blow threatened the entire Southern Front.

Having broken through to open space, the 1st German Tank Group could have freely chosen any direction: all roads were open. It could have struck the rear of the Southern Front. It could have headed to Kiev. If Kiev was being defended it could, instead of engaging in battle, have hit the metal-producing sites of the Ukraine: Dnepropetrovsk, Dneprodzerzhinsk, Zaporozhye. Once there, it could have reached the Crimea. It could have gone to the bases of the Black Sea fleet and taken them. Or it could have taken the largest hydroelectric plant in Europe, DneproGES. It could have crossed the Dnepr and taken Donbass—the largest coal region of the Soviet Union. It was also possible to continue to the North Caucasus toward the main petroleum sources of the Soviet Union. But Hitler was preparing for war in a very strange manner: so many open directions, and he only had one tank group against all of Ukraine, Moldavia, Crimea, Donbass, Don, North Caucasus, and Trans-Caucasus—with only 799 obsolete and worn-out tanks. The First Tank Group fought fierce battles on the western bank of the Dniepr River, then crossed the Dniepr and joined the Second Tank Group. This was how four armies of the Soviets were encircled; 664,000 prisoners were taken, and with them huge quantities of arms and supplies. But the Germans paid for this grandiose bounty by losing the tempo of their attack: it happened in September, so they could not start moving toward Moscow before October, which meant rain, dirt, and mud. No blitzkrieg was possible in the remaining months of 1941.

In Byelorussia, the Red Army had an even worse time. The Western Front had four armies. The main forces of the front were concentrated in the Byelostok bulge. Two German tank groups struck the undefended flanks and linked east of Minsk. The 3rd, 10th, and parts of the 4th and 13th armies, all together almost thirty divisions, found themselves in a pocket. The Western Front collapsed even quicker than the Southwestern and the Southern Fronts. Could it be that before the war General Zhukov did not understand that one cannot herd huge numbers of troops into bulges that become traps?

The answer to this question was given by one of the most brilliant Soviet troop commanders, the deputy commander of the Volkhov front Lieutenant General Andrey Vlassov. On June 22, 1941, he was a major general in command of the 4th Mechanized Corps in the Lvov bulge. In 1942 he was ordered to command the 2nd Shock Army, which found itself in a hopeless position. Vlassov was ordered to complete an operation that he had not prepared, had not started, and that had already failed. The 2nd Shock Army could not be saved. It perished, and Vlassov was taken prisoner. In a protocol from questioning on August 8, 1942, it was recorded: “Regarding the question of whether Stalin had intentions to attack Germany, Vlassov declared that such intentions, undoubtedly, existed. The concentration of troops in the Lvov region points to the fact that a strike against Romania was being planned in the direction of the petroleum sources. . . . The Red Army was not prepared for the German invasion. Despite all the rumors about the operations conducted by Germany, in the Soviet Union nobody believed in such a possibility. During preparations, the Russians meant only their own offensive.”¹ There is no other explanation for the concentration of Soviet troops in the Lvov and Byelostok bulges.

Forty-nine years later the same explanation was given by the Deputy Chief of the General Staff of the Soviet Military Forces, General Makhmut Gareev: “A main blow to the flank in the main alignment of the enemy’s troops, delivered in the direction of Krakow, would have allowed us to cut Germany off from the Balkans in the very beginning of the war, to deprive her of the Romanian oil, and to separate the allies. On the other hand, carrying out the main blow on the joint flanks of the western and northwestern fronts led to a frontal attack in difficult conditions against heavily fortified defense positions in East Prussia, where the German army could offer fiercer resistance. And totally different conditions, and consequently different objections, could have arisen if the strategic plans were to lead defensive operations to deflect aggression early in the war. In this case, no doubt, it was more advantageous to have main forces in the strip of the western front. But such a course of strategic actions was not planned.”²

Let’s compare the opinions of the two generals. They are saying the same thing: there was no preparation for defense, only offense, moreover, an offensive in the southwestern direction (that is, from the Lvov bulge) with the objective of cutting Germany off from her oil suppliers and main allies. If someone places on the map the Soviet Shock armies, mechanized and airborne corps, air bases, staffs, and Zhukov’s generals, he will be forced to acknowledge, even without Vlassov and Gareev’s testimonies, that such positioning of troops in the bulges directed toward the enemy could only lead to catastrophe in the event of an invasion by the enemy, while it would lead to a brilliant victory in the event that the Red Army was first to deliver its sudden crushing blow.

Between the Baltic and Black Seas lie the impassible swamps of Polesye. This is the largest area of swamps in Europe. These swamps divided the entire theater of military operations into two regions, two strategic directions. An enemy advancing toward Russia from the west must choose the direction of his main blow: he can go to the north of Polesye, or to the south. Traditionally, conquerors advancing from the west went north of Polesye: Warsaw-Brest-Litovsk-Minsk-Smolensk—this is a direct route to Moscow. The question before Hitler’s strategists was: where to plan the primary blow, north of Polesye or south? Hitler’s strategists decided that the primary blow was to come to the north, the secondary to the south. In 1941 Hitler had four tank groups. Three of them were designated for action north of Polesye, and one to the south.

Soviet military intelligence knew of the concentration of German troops and knew that three tank groups would act against the Baltic and Byelorussian areas, while only one would go against the Ukraine. What should the Soviet command have done? Since the Germans prepared the primary blow to the north of the swamps, the main forces of the Red Army should also have been placed there—in the western direction. Even if Soviet intelligence had not known anything about Hitler’s plans, the main forces should have been kept in the western direction. It is obvious even to the lowest ranking officer that the direct route to Moscow runs through Byelorussia and Smolensk.

Troop alignment is, figuratively speaking, equal to positioning chess figures on the board. The General Staff is the brain of the army. The Chief of the General Staff is the most capable and smartest general in the entire army. Starting in February 1941, Zhukov was chief of the General Staff. Here is the situation we are examining: on June 22, the Germans delivered the primary blow north of Polesye and crushed Soviet armies in the Belostok bulge, from where the German tank groups could head toward Smolensk and Moscow. Meanwhile,

Zhukov's main forces were not there, but south of Polesye. The direction facing the greatest threat was north of the swamps. Conquerors from the west have always advanced to the north, but Zhukov deployed his main alignment to the south.

The consequences of Zhukov's positioning were catastrophic. In order to divert the attack on Moscow, the Red Army had to send, urgently and under heavy enemy bombers' raids, railway trains with divisions, corps, and armies from the Southwestern Front to the Western Front. There, again under heavy bombing, the trains were unloaded and the troops went straight into battle. What happened was that the 16th Army was advanced from the Trans-Baikal region to Ukraine, meaning south of Polesye. The army had just begun to unload when the German invasion happened. They were forced to urgently load the 16th Army back into trains and herd it several hundred kilometers to the north. The staff of the 16th Army arrived at Smolensk from Ukraine and began to unload, but the communications battalion could not be found. Without communications, it is impossible to command troops. An entire army found itself without command. This is what must be called a "headless army." The culprit here is not Stalin, but Zhukov, who in May and early June moved a large part of the armies of the second strategic echelon to the south of Polesye, instead of to the north.

This is just one example, there are plenty more. The 19th Army was secretly moved from the North Caucasus to Ukraine, in other words, south of Polesye. This army also began to unload. It was ordered to get back on the trains and sent to Smolensk. The same thing happened: the artillery was unloaded in one place, while the trains with shells had not yet arrived. Tanks were there, but the repair crews had not arrived. The division staffs were there, but the troops were still far behind. What was General Zhukov thinking about before the German invasion? Why was the strongest Soviet military district before the war not the Western district, which was in the most threatened area, but the Kiev district? If Zhukov had been thinking of defense, he of course would have deployed the most powerful Soviet groupings in the most threatened areas—north of Polesye.

But Zhukov was not thinking of defense, and was not planning for it. There is plenty of testimony that right before the invasion Zhukov, Vatutin, Vasilevsky, and all the generals and officers of the General Staff worked sixteen and seventeen hours a day without weekends or holidays. "The areas for the concentration of primary efforts were not chosen by the Soviet commanders in the interests of strategic defense operations (such an operation was simply not foreseen and not planned), but for entirely different means of action," wrote Gareev.³

If we prepare to deliver a sudden all-crushing blow to Germany and her allies, we must also choose the direction of the primary attack: north of Polesye, or south. If we attack to the north, we find ourselves in East Prussia, which is heavily fortified and populated with Germans who will offer resistance. In this area we can only advance from east to west along the shores of the Baltic Sea, so all the rivers and streams would have to be crossed in their lower currents, almost at their mouths. Among those rivers, there are two powerful water barriers: the Vistula and the Oder. In their middle, and especially in their lower currents, they are extremely difficult to cross. However, if we strike south of Polesye the picture changes. In this case, the Red Army would end up in the Krakow region. It is inhabited by Poles who, after two years of German occupation, would have met any other army with flowers and offers of help. Here, on the Polish plains, there are no formidable modern fortifications. Here one does not need to expend efforts to cross rivers. In their upper currents they do not pose serious barriers. If one carries out the attack south of Polesye, then during the advancement his left

flank will be defended by the mountains of Slovakia, primarily by the Tatra Mountains which are up to 2,500 meters tall. Advancing troops would only need to worry about securing one flank; the other would be covered.

An attack on Krakow out of Lvov would have divided Hitler's coalition, cutting Germany off from all her eastern allies: Slovakia, Hungary, Romania, and Bulgaria. An attack south of Polesye—and this is the most important point—would have cut Germany off from her primary source of petroleum: Romania. The delivery of just this one strike would have immediately secured the Soviet Union's victory in World War II. Further on from the Krakow region, it was best to turn north. In this case, the Red Army troops could freely advance to the Baltic Sea, cutting the German army off from Berlin and the inner regions of Germany. This would have formed a corridor, in which the Red Army had no threats: to the left, advancing Soviet divisions, corps, and armies would have been covered by the Oder River right up to the sea, and to the right—by the Vistula River. German counterattacks here would have been impossible. This is exactly what Stalin was preparing in the first half of 1941. The plan of such an operation is a picture of diabolical strategic beauty.

Churchill's Warning and Stalin's Reaction

Can Churchill be trusted in this matter? He is interested in making us clash with the Germans as soon as possible. Isn't it so?

—VYACHESLAV MOLOTOV, IN *MOLOTOV: MASTER OF HALF A DOMAIN*

For more than half a century, historians have been saying that Churchill warned Stalin about the impending German invasion, but Stalin ignored his warnings. Perhaps we should ask a different question: Why should Stalin have believed Churchill?

Churchill was one of the most powerful political leaders who had understood the great threat posed by Communism back in 1918. He invested considerable effort in helping the Russian people get rid of that regime. His efforts turned out to be insufficient but still, Churchill did more for the destruction of Communism than all other world leaders. Churchill was an open enemy of the Communists, and never tried to hide that fact. But all of a sudden in 1941, Churchill rushed to warn Stalin, the most powerful Communist in the world, that Hitler posed a danger to the Soviet Union.

From the Soviet point of view, Churchill could have had only one political motive: to deflect the German attack to anywhere other than Britain. Even before World War II began, on March 10, 1939, at the Eighteenth Congress of the Communist Party, it had been openly declared that Great Britain wanted to trigger a war between the Soviet Union and Germany, while it remained on the sidelines of this fight. We do not know whether that was indeed Churchill's intention, but it was exactly how Stalin interpreted every action of British leadership and diplomacy. As Admiral N. G. Kuznetsov put it, "Stalin, of course, had more than enough grounds for thinking that England and America were seeking to have us collide head-on with Germany."¹ Upon receiving any letter from Churchill, Stalin, without reading it, could guess its contents.

To understand Stalin's suspicion of Churchill's letters, we must also examine the strategic situation in Europe. The concentration of power against weakness was the main principle of strategy. Germany was unable to apply this principle in World War I, because it was fight-

ing on two fronts. Attempts to concentrate great efforts on one front automatically led to the weakening of the other front, and the enemy immediately exploited it. As a result, Germany had to renounce a strategy of destruction in favor of the only other alternative, a strategy of attrition. But Germany's resources were limited, in contrast to the resources of its enemies. A war of attrition could only end in catastrophe for Germany.

Both the German General Staff and Hitler himself understood that a war on two fronts would be catastrophic for Germany. Speaking at a meeting with the High Command of the German armed forces on November 23, 1939, Hitler said that a war against the Soviet Union could only begin after the war in the west had ended. In 1939 and 1940, Germany always fought on only one front. The German General Staff was able to apply the concentration principle brilliantly, thrusting the enormous German military power first against one enemy, then against another. The main problem facing German strategy was to prevent war from breaking out on a second front. As long as the Germans were fighting on one front only, they won brilliant victories. Two fronts meant abandoning all strategic principles, regressing from the strategy of crushing to the strategy of attrition. It would spell the end of the blitzkrieg, and would mean catastrophe.

In 1940, in terms of strategy, Churchill could only have dreamt that the war Germany was fighting would transform from a one-front war into a two-front war. It was the only way to save Great Britain. In May 1940, the British army suffered a crushing defeat unprecedented in history. The German tank divisions broke through to La Manche, and trapped forty British, French, and Belgian divisions against the coastline in the region around Dunkirk. The British troops managed to evacuate to Britain from France in early June 1940, but the losses were horrendous. They had left all their military equipment on the French coast, all their tanks, artillery tows, 63,000 automobiles, and more than half a million tons of ammunition and supplies. The human casualties of the British army totaled more than 68,000. After leaving the continent, the British army was left practically without heavy weapons. Fewer than one hundred obsolete tanks were left on the British Isles.²

Belgium capitulated on May 28. France fell on June 22, 1940. Hitler's troops reached the shores of the Atlantic Ocean and took over naval bases of tremendous strategic value. From this time, the piracy of German U-boats increased sharply on the sea routes. Britain, an island nation, faced the threat of a naval blockade and the most acute crisis in trade, industry, and finance. Worse still, the German military machine, which at that point seemed invincible, was making intensive preparations to land on the British Isles. It was in this environment that Churchill wrote to Stalin on June 25, 1940. On June 30, the German armed forces captured Guernsey, one of the Channel Islands. In almost a thousand years of British history, this was the first time since 1066, meaning after the Norman conquest of Britain, that an enemy had captured a part of the British Isles. What would follow—a German occupation of mainland Britain? Guernsey was taken without resistance. For how long could Britain resist?

Stalin received Churchill's message the day after Germany had seized Guernsey. What were Churchill's interests? Did he want to save the British Empire or the dictatorship in the Soviet Union? For Stalin, Churchill was not an unbiased observer who, out of friendly sentiments, was warning of danger, but a man who desperately needed help and allies in a conflict against a fearful enemy. Stalin therefore was very suspicious of Churchill's letters.

Японский самолет «Накадзима» Б5Н2. (Вес — 3,8 тонны. Макс. скорость — 378 км/ч. Дальность полета — 2000 км. Боевая нагрузка — 1 торпеда 800 кг).

Советский самолет «Иванов», или СУ-2. (Вес — 4 тонны. Макс. скорость — 486 км/ч, дальность полета 1200 км, бомбовая нагрузка — 600 кг).

The Japanese Nakajima B-5N2. The Japanese used these planes in their surprise attack on Pearl Harbor. By the end of the 1930s the Soviet Union developed the Su-2 (Ivanov). Soviet designers were not aware of the Japanese plane, but in both countries identical planes were developed. Stalin was planning to use the Su-2 against the Germans in the same way the Japanese used the Nakajima against the U.S.

A close-support and anti-tank warplane, the Il-2 was the most produced aircraft in military history. Stalin was prepared to attack first. His focus was not on building interceptors to protect against an enemy strike but on warplanes that could support a first strike.

An 8-inch Howitzer B-4. Each projectile weighed 220 pounds. These guns were needed primarily for an offensive war in order to break hardened enemy defenses or during an assault on cities. By the summer of 1941 the Red Army had concentrated hundreds of them on the German border, each with a supply of six hundred rounds of ammunition. In a defensive war, they proved to be of little use, until 1944 when the Red Army crossed into Germany for the final offensive of the war.

The Red Army was trained to cross rivers, a key element in an offensive war. In a defensive war a retreating army uses its own bridges and then destroys them.

In 1940 Soviet industry was converted to wartime production. Under Stalin's orders millions of teenagers were mobilized into "Labor Reserves" that provided slave labor for military factories. Defection from the Labor Reserves was punishable by a military court-martial and the death sentence.

In the spring of 1941 the Supreme Soviet commanders spent long weeks on the Soviet Union's western border. People's Commissar of Defense Marshal S. K. Timoshenko and Chief of the General Staff of the Soviet Army, General Georgi Zhukov, on the Romanian border. This is not where Hitler attacked, but an area where the Soviet offensive against Germany was to be launched.

In 1941 the major means of German army transportation was horse-driven wagons and carts, rarely shown in World War II newsreels.

*Even heavy artillery
was transported
by horses.*

Soviet attack aircraft massed at airfields close to the western border were vulnerable to Hitler's first strike on June 22 and were destroyed on the ground, wing-tip to wing-tip, in a massive bonfire of aircraft.

In Byelorussia the Red Army abandoned twenty-five thousand railroad cars of artillery ammunition close to the border. Why were they placed there? Why were they on railroad cars? Where were they heading?

T-34 tanks, abandoned by the Red Army in the summer of 1941, fought under the German flag for the rest of World War II.

While the Soviet Union was claiming friendship with Hitler in a deceptive June 13 TASS announcement, Stalin was massing Soviet troops near the western borders. The Germans attacked while the Soviet troops were still moving forward by rail. Once the tracks were destroyed the tanks could not be unloaded and the best ones, the T-34s, were left as a present for Hitler.

Even the best German Panzer divisions were using Soviet T-34 tanks.

Among millions of Soviet prisoners of war was Stalin's son, Yacov Dzhughashvili. A letter from one of his friends, dated June 21, was found in his pocket. It described an upcoming "stroll to Berlin." By striking first Hitler spoiled the stroll.

Soviet troops of the Second Strategic Echelon, drafted from Gulag prisoners, surrender without a fight. Stalin said that if the fire is good even wet logs can burn in the blaze, but if the fire is weak a wet log will not help. If the Soviet first strike had succeeded, the poorly trained and equipped Gulag-drafted soldiers would have fought well. But when the Germans struck first the skeletons from the Gulag were useless.

Released Gulag prisoners had no time to change into new uniforms, and were captured by the Germans in their prison garb at the front. Entire regiments, divisions, and even corps were dressed in the black clothes of prisoners. The Germans called them "Black Divisions." Why would Stalin move his prisoners from the Siberian labor camps to the border and give them weapons, if not to attack Hitler?

Hitler's army was totally unprepared for war in the Soviet Union. The German army was not properly equipped to fight in the frost, snow, and mud of the Russian winter. Even with the most optimistic scenario, Hitler could not have conquered all of the Soviet Union in one summer.

Russian soldiers were wearing sheepskin coats. War could not be fought in Russia without these coats and the Germans did not have them. That is why Stalin did not believe that Hitler would strike first while he was still totally unprepared for a war that would have to last longer than a summer campaign.

Churchill wrote several letters to Stalin. But unfortunately they all reached Stalin at times when Churchill was in dire straits. The best-known letter in this series reached Stalin on April 19, 1941. Churchill wrote this letter on April 3 and requested the British ambassador in Moscow, Sir Stafford Cripps, to immediately hand it to Stalin in person. But neither Stalin nor Molotov would receive the ambassador. Finally, on April 19, Cripps did not hand but transmitted the message, and not to Stalin, but only to Andrei Vyshinsky, Deputy People's Commissar of Foreign Affairs. On April 22, Vyshinsky informed the ambassador that Churchill's message had been handed to Stalin.

By the time Stalin received the letter, the British situation had exacerbated, compared with the time when the letter was written. The German army seized Belgrade on April 13 and headed south, posing threats to British troops in the Balkans. Rommel's tank divisions reached the Egyptian border in the area of Bardia and Es-Sallum on April 12. If they broke through to the Suez Canal, the main artery connecting the British Empire would be cut. Yugoslavia surrendered to Germany on April 17. The road to Greece was open. St. Paul's Cathedral in London was damaged in an air raid on April 16. In April, Greece was on the verge of surrender. On April 18, Korizis, the Greek prime minister, committed suicide. After that, the capitulation talks commenced. On April 23, the Greek armed forces surrendered. British troops there were in a catastrophic position, and the question was whether or not they could be evacuated. In this context, Stalin received the most important of Churchill's letters.

On May 20, 1941, the German armed forces started the most massive airborne operation in German military history to capture Crete. There were 32,000 British and 14,000 Greek troops on the island. Several days later, without having superiority in numbers, German paratroops took control of the island and annihilated the more numerous British and Greek forces. Military experts unanimously concluded that the taking of Crete was an ingenious rehearsal by Hitler's paratroops before landing on the British Isles. On May 24, 1941, the largest ship of the British fleet in the Atlantic, the battle cruiser *Hood*, clashed with the *Bismarck*, Germany's largest battle ship. The battle lasted eight minutes. One direct hit to the British ship caused it to explode and sink in a matter of minutes. Out of the 1,421 crew members, only three survived. In June 1941, German U-boats sank sixty-one British merchant ships, totaling 431,000 tons.³

Churchill wrote his first long letter to Stalin on June 25, 1940, when neither Hitler nor the German generals had any intention of invading the Soviet Union. The plan for Operation Barbarossa or any other plan for war against the Soviet Union simply did not exist. Churchill's letters were not based on knowledge of German plans, but on sound calculations. He simply directed Stalin's attention to the situation in Europe: today Britain had problems with Hitler; tomorrow it would inevitably be the Soviet Union's turn. Churchill urged Stalin to unite with him against Hitler, and to lead the Soviet Union into the war on the side of Great Britain and all of vanquished Europe.

The text of Churchill's message received in Moscow on April 19, 1941, can be found in hundreds of Soviet books and articles. Here it is: "I have received reliable information from a trustworthy source that the Germans, after deciding that Yugoslavia had fallen into their clutches on 20 March, began to transfer three armoured divisions, of the five stationed in Romania, into the southern part of Poland. As soon as they learnt of the Serbian revolution, this transfer was cancelled. Your Excellency will easily appreciate the significance of these

facts.” All Soviet sources publish Churchill’s message in this form, insisting and assuring that it was a “warning.”

I see no warning here. Churchill was talking about three tank divisions—many by Churchill’s standards, but by Stalin’s, it was not a great deal. Stalin himself at the time was secretly setting up sixty-three tank divisions, each of which was stronger than a German division both in number and in quality of tanks. Mass production of tanks was already set up in the Soviet Union at that time, and they remained the best in the world throughout the war. Nobody in the world, all through the war, created anything even close to the tanks that Stalin had before the war even began. Having received a report about three German divisions, why should Stalin have guessed that there would be an invasion? If the report about the three tank divisions was sufficient “warning” about preparations of aggression, we should not accuse Hitler of being the aggressor: German intelligence gave Hitler reports about tens of Soviet tank divisions grouping along the German and Romanian borders.

Churchill suggested that Stalin assess “the significance of these facts.” How could they be assessed? Poland, historically, has always been the gate through which all aggressors passed from Central Europe to Russia. Hitler wanted to transfer tanks to Poland, but he changed his mind. Compared to Poland, Romania was a very bad springboard for aggression. German troops would be harder to supply there than in Poland. In an attack from Romania, the road to the vital heartland of Russia would be longer and harder for an aggressor, who would have to overcome a multitude of barriers, including the lower reaches of the river Dnepr. Had Stalin been preparing himself for defense, and had he believed Churchill’s “warning,” he should have breathed a sigh of relief and relaxed his military preparations. In addition, Churchill explained why the German troops were staying in Romania instead of being transferred to Poland: the Germans had problems in Yugoslavia, particularly in Serbia. In other words, Churchill said that the German tank divisions were left in Romania not for aggression eastward against the Soviet Union, but on the contrary, from Romania they were pointed southwest toward Serbia, with their backs to Stalin.

Churchill’s letter had tremendous significance, but it absolutely couldn’t be regarded as a warning. It was more of an invitation to Stalin: the Germans wanted to transfer their divisions to Poland, but changed their minds; therefore, the Soviet Union had nothing to fear, especially since the German tank divisions in Romania had their backs turned to Stalin. Churchill wanted Stalin to evaluate these facts and act on them.⁴ Sir Basil Liddell Hart, the British military historian, made a brilliant analysis of the strategic situation of that time as seen from Hitler’s standpoint. According to General Jodl, to whom Liddell Hart referred, Hitler repeatedly told his generals that Britain’s only hope was a Soviet invasion of Europe.⁵ Churchill himself wrote on April 22, 1941, that “the Soviet government knows full well . . . that we stand in need of its help.”⁶ The only way Stalin could help Britain was by attacking Germany.

Hitler made one irremediable mistake, but not on July 21, 1940, when he ordered preparations for war against the Soviet Union. The mistake came on August 19, 1939, when he agreed to the Molotov-Ribbentrop Pact. Having agreed to the division of Poland, Hitler had to confront an unavoidable war against the West, having behind him the “neutral” Stalin. Precisely from this moment, Hitler had two fronts. The decision to begin Operation Barbarossa in the east without waiting for victory in the west was not a fatal error, but only an attempt to right the fatal error he had already made. But by then it was too late. Even the

capture of Moscow would not have solved Hitler's problem, because beyond Moscow still lay several million square kilometers of unending territory, vast centers of industrial power, and inexhaustible natural and human resources. It is always easy to begin a war with Russia, but not so easy to finish it. It was certainly easy for Hitler to fight in the European part of the Soviet Union: the territory was limited, there were many relatively good roads, and the winters were mild. Was Hitler ready to fight in Siberia, in that limitless expanse, where there were no roads and where the brutality of the cold was only matched by the brutality of Stalin's regime?

Stalin knew that war on two fronts spelled suicide for Hitler. He calculated that Hitler would not commit suicide by starting a war in the east without first finishing the war in the west. Stalin was patiently waiting for the German tank corps to land in Britain. Meanwhile, he did everything possible to convince Hitler of his desire for peace. That was why Soviet anti-aircraft guns were not firing on German aircraft crossing the Soviet borders, and Soviet newspapers and TASS proclaimed that there would be no war between the Soviet Union and Germany. If Stalin had succeeded in convincing Hitler that the Soviet Union was neutral, then the bulk of German forces would have been engaged in fierce battles trying to land on the British Isles and leaving practically all Europe defenseless and ripe to be "liberated" by the Red Army. Poland, Czechoslovakia, Denmark, Norway, Belgium, Holland, Luxembourg, Yugoslavia, France, Greece, and Albania no longer had armies, governments, parliaments, or political parties. Millions of people had been driven into Nazi concentration camps and the whole of Europe was awaiting its liberation.

Stalin had helped Hitler come to power and transformed him, in Stalin's words, into a real "Icebreaker" that would trigger the world revolution in Europe. Stalin pushed along that Icebreaker of the revolution. Stalin demanded from the French and from other Communists that they let the Icebreaker crush Europe. Stalin supplied the Icebreaker with everything needed for a victorious advance. Stalin closed his eyes to all the crimes committed by the Nazis. But Hitler guessed Stalin's design. That was why World War II ended catastrophically for Stalin: he only got half of Europe.

A Blitzkrieg against Russia?

The first endless columns of Russian prisoners began to file into Germany. From that moment, the flow did not stop. Endless transports of Russian prisoners moved through roads and railroads all the time. But it was of little use. In the place of each vanquished army, the Russians raised another one. The endless lands of the tsars seemed to have unending human resources. How much longer could Germany stand against such competition? Will there not be a day, when Germany, regardless of the fact that it just achieved yet another victory, will be left without new troops, while the Russian command will again and again move new armies to the front? What will happen then?

—ADOLF HITLER, *MEIN KAMPF*

We are so accustomed to thinking of Hitler and his armies as remarkably superior that we accept without question that Stalin was afraid of Germany. However, why should Stalin have feared Hitler? Everyone, including Hitler himself and his generals, knew that Germany lacked the resources to fight a prolonged war. Hitler's only chance was a lightning war, a blitzkrieg. But a blitzkrieg against the Soviet Union was impossible, because it stretched more than ten thousand kilometers from west to east. If Hitler could seize even one thousand kilometers per month, which was impossible, even then he would have to count on a year of war. In addition, a regular European army could carry out a successful offensive on Soviet territory only four out of the twelve months of the year, from May 15 to September 15 (if there was no rain). Even if it was possible to take over the entire country during these four months, then what would an aggressor do with this territory when fall and winter came? It was easy to enter Russia, but hard to exit. Also, in June 1941 the peacetime Red Army counted 5.5 million soldiers and commanders. If every month Hitler killed and imprisoned one million Soviet soldiers, even then the war would last at least half a year, and the last phase would occur in December. He would have to overcome frost, snow, and blizzards. He would have to prepare for winter.

The challenges for the Germans wouldn't end there. Even in the supercritical conditions of the summer of 1941, the Soviet system of mobilization worked perfectly, and an additional 5.3 million people joined the ranks of the Red Army within one week of the war, before July 1, 1941.¹ After one week of the war, the Red Army consisted of over 10 million people. Even if Hitler continued to destroy a million per month, the war would still last a year. But the Soviet mobilization continued in July, August, September . . . "Our forces are innumerable," Stalin once said. The mobilization resources of the Soviet Union were almost 20 percent of the population, meaning 34.5 million people. This resource was fully used during the war. It was even surpassed. How long would it take to destroy such an army?

Germany was not ready for a war against Russia, and Stalin knew it. In 1940, British aviation already regularly bombed German cities, ports, railroad stations, and factories. Hitler couldn't secure even Berlin's safety from the British bombers. Did he have nothing better to do in these conditions than go conquer new lands in the east? Was Hitler ready to fight on two fronts?

We find some answers in the diary of the Chief of General Staff of Germany's land army, Colonel General F. Halder.

October 7, 1940: "An air war on two fronts is impossible."

November 26, 1940: "Horse-drawn carriages for anti-tank weapons. We have no limbers. . . . We have no capacity to supply our troops in Bulgaria with mountain equipment. . . . We have not a single snow-cleaning machine. . . . It is impossible to maintain a strict control over the large cities of France. . . . The empire's railroads in the future will be unable to work under such strain as today."

November 27, 1940: "Operations to take over the endless Russian spaces will not be successful."

December 3, 1940: "The fuel situation is bad. The tire situation is very bad."

December 4, 1940: "Too little artillery."

December 13, 1940: "Capturing Moscow does not have much significance (in Hitler's opinion). . . . The air forces are facing a war on two fronts."

December 23, 1940: "The situation with rubber is difficult."

January 16, 1941: "Anti-aircraft gun battalions of the land army, forty battalions. The special personnel for them have yet to be prepared. This is feasible only by autumn."

January 28, 1941: "The fuel situation is serious. We can count on fuel supply during the period of concentration and deployment, and two months of operations. . . . Automobile tires. The situation is very serious."²

Even though the German command knew that "an air war on two fronts was impossible," they still decided to start a two-front air war. Not only Halder but Hitler himself understood that taking Moscow did not mean the end of the war. And yet, Hitler's entire plan boiled down to taking Moscow in the belief that the rest of Russia would crumble. Hitler's generals planned to destroy Russia in three months, but they had only enough fuel for two.

"Operation Barbarossa. The goal of the campaign is unclear. It does not at all affect England. Our economic base does not improve from this. If we are tied down in Russia, the situation will become even more difficult. . . . Operation Barbarossa is extremely risky," Halder wrote.³ Stalin had iron logic, and when he was warned of a possible German invasion,

he asked: “But what for?” Hitler’s chief of staff, who planned the war, was wondering exactly the same.

A blitzkrieg is a tank war. On September 1, 1939, Germany only had 2,977 tanks.⁴ How did it happen that out of this number almost half (1,445 Pz-I tanks) had no cannon? How come the other half (1,223 Pz-II tanks) had only pathetic 20-mm cannons? How come they only had 98 Pz-III tanks with their useless 37-mm cannon, and only 211 Pz-IVs, which had 75-mm short-barreled cannon, not designed and not useful for war against other tanks?

By June 1941, Hitler had in his invading army 3,332 tanks,⁵ all of them light and all of them obsolete—not one single heavy tank. There were medium ones, which were simply light tanks covered with an extra layer of armor plates. Their defenses increased from this, but their mobility decreased: their speed, maneuverability, and ability to pass through rough terrain—all of which were necessary for maneuvers in large open spaces. Hitler didn’t have a single amphibious tank, or one with anti-projectile armor, nor one with powerful cannon. Stalin, on the other hand, had 23,925 tanks, including the best models in the world that had the best tank-building innovations of the time: powerful long-barrel cannons, wide caterpillar tracks, anti-tank defenses, diesel motors, and so on. Moreover, Stalin possessed almost endless means for producing these tanks. Stalin had more amphibious tanks than Hitler had tanks in total.

In addition to tanks, an army needed powerful tank formations. In Germany, tank divisions were created. But these divisions, to put it mildly, were inferior. In 1939, Hitler had six tank divisions. Germany entered World War II with six tank divisions! What sort of blitzkrieg could one dream about having only six tank divisions?! And even today some continue to claim that German generals understood the nature of blitzkrieg! In 1940, the number of tank divisions rose to ten, and in 1941 to twenty-one. The increase in the number of tank divisions was attained not by producing tanks, but by reassignment. In practice, the same number of tanks was divided first into six divisions, then ten, then twenty-one.

Liddell Hart commented:

This doubling in number of armored forces turned out to be sheer illusion, since it was achieved mostly at the expense of reducing the number of tanks in each division. . . . Some of the qualified expert tankers attempted to argue against such a decision, since the result of such measures was to multiply the number of staffs and secondary units in the so-called “tank divisions.” . . . Out of 17,000 people in the division, only 2,600 were tankers. But Hitler was stubborn. Seeing before him the vast Russian territory, he wanted to feel that he had more divisions, capable of delivering blows deep into the land, and counted on technological advantage over the Russians to serve as sufficient compensation for the “dilution” of his tank troops. . . . However, cutting the number of tanks in the divisions increased the main disadvantage of the German tank division—the fact that its units and subdivisions mostly consisted of infantry, and could not move on difficult terrain.⁶

Liddell Hart put the term German “tank division” in quotation marks. He explains his point of view: “Tanks could continue an offensive, but they, just like all other track vehicles, made up only a small part of each so-called “tank division.”⁷

Tanks alone do not ensure strength. A lone tank that ventures far ahead is vulnerable. A tank must be supported by infantry. “In 1941, the German army still consisted mostly

of plain infantry divisions, which moved on foot, and used animal transport,” said German General Guenther Blumentritt.⁸ On June 22, Hitler had on the eastern front 750,000 horses.⁹ A convoy of 220 horses with carts followed each German tank. Was it on carts that they planned to carry out the blitzkrieg? Out of 153 divisions launched by Hitler against the Soviet Union, only seventeen were tank divisions.¹⁰ There was not a single tank in the thirteen German motorized divisions at the beginning of World War II, while each Soviet rifle division had its own tank battalion of T-26 tanks. We have been taught to laugh at this tank. But the German infantry did not have tanks at all!

The entire German tank force was divided between the four tank groups. The rest of the German army fighting against the Soviet Union didn't have a single tank. It consisted entirely of infantry and 750,000 horses with carts. Colonel General Lotar Rendulic described his 20th Mountain Army: “With the exception of rear transport units, the army consisted entirely of infantry troops—200,000 soldiers and 70,000 horses.”¹¹ The German magazine *Der Spiegel* once published a giant photograph of laughing German soldiers.¹² That one photograph told more truth about the war than the whole article, and many articles like it, and even libraries of books. The photograph showed German soldiers walking on Soviet land in 1941 during the blitzkrieg. All are on foot. They do not have a single submachine gun. Their weapons consist of rifles with bayonets, the 1898 model, and two machine guns. In the background, there are hundreds of carts.

The German army relied heavily on cars and motorized transportation. The plethora of such machinery—more than 500,000 cars in the invading army—played a cruel trick on the Germans. While on the European front, which was heavily road-linked, such an abundance of motorized transportation was more than sufficient, but the German cars on the Russian front (along its so-called roads) often turned into a setback. First, the Germans needed specialized, road-tolerant cars, wheel-track and track-based transport vehicles and tractors. Second, the chronic lack of fuel led to frequent halts in the general mass of automobiles.

Field artillery was the main tool of the Red Army for breaking through enemy defense lines. First were the howitzers. A howitzer, compared to cannon of the same weight, had a slower initial shell speed and a smaller range. But its shells were more powerful and its fire trajectory was curved, which was useful for firing upon an enemy dug into the ground. Marshal Kulik commanded the Red Army artillery for many years. During his leadership, the best artillery systems in the world were created, primarily the howitzers. By June 22, 1941, the Red Army had 15,464 howitzers of all types.¹³ The most powerful ammunition factories were created for supplying them. The German army had 10,810 howitzers by June 1, 1941.¹⁴ However, those howitzers had to be divided among several fronts, including the African one. Furthermore, Germany had too few non-ferrous metals to manufacture artillery shells in such quantities as were being produced in the Soviet Union. Finally, the German howitzers were obsolete, developed during World War I or even before it.

Stalin had long-range bombing aviation, which Hitler did not have. In 1940 and 1941, Germany was already being bombed by British strategic aviation. Stalin was ready to add his forces to this effort. Hitler, meanwhile, planned to “bomb Britain out of the war,” but that plan failed, because he had no strategic aviation at his disposal. Later on, Hitler decided to take over the European part of the USSR up to the Arkhangelsk-Astrakhan line, and everything east of that line he was going to leave to the bombers. The problem with this plan was that Hitler had almost no long-range bombers.

When he received reports that the German army was preparing to invade, Stalin simply did not believe them. Molotov said before the invasion: “One must be an idiot to attack us.” According to Stalin’s calculations, an attack on the USSR would have meant suicide for Hitler and his empire. This calculation was entirely confirmed by the results of the war. The question is not whether Stalin was afraid of Hitler or not. Stalin had no reason to be afraid. Stalin considered Hitler and his generals to be reasonable people, and reasonable people would not embark on such an adventure, with Britain on their back. Reasonable people could not plan to crush the Ural and Siberian industrial complexes using long-range bombers, especially when they had no such bombers. Here we must ask a different question: why did Hitler attack the USSR?

Hitler signed Open Directive No. 21 ordering Operation Barbarossa—the attack on the Soviet Union—on December 18, 1940: “The end goal of the operation is the creation of a protective barrier against Asian Russia along the line Volga-Astrakhansk. In this manner, in case of need the last industrial region the Russians have left in the Urals could be paralyzed using aviation.” Since Germany invaded the USSR on June 22, it was impossible to reach the Volga line before the autumn rains. German tanks had a short motor operating time, and therefore on the way to Moscow the entire German army inevitably had to stop for two to three weeks for the overall repairs of tanks (replacement of engines, transmissions, pistons, and so forth). If Moscow had been taken in August, they would have had to continue toward the Volga line, and for this another stop would have been needed for the overall repair of tanks and the recovery of the troops’ fighting capacity. It would have been impossible to reach the Volga even by September. In October, there would be rain and mud. Even if they could have successfully reached the Volga line in September, it was impossible to bomb the Urals from this position: there were few air bases on the right bank of the Volga. First, they would have to be built, which was hard to do: in October, the area was a bare wet steppe, in November, a bare frozen steppe.

If Hitler had been able to build air bases on the right bank of the Volga River, he still would not have been able to bomb the industry centers of the Urals. The German Do-17, Ju-88, and He-111 bombers were created for completely different tasks. Their missions had been the destruction of small-scale, mostly mobile targets in the area of battle and in the enemy’s near rear. These bombers were created for short-range flights, had a small bomb-carrying capacity, and could act only at low and medium altitudes. To reach the Urals and return, the bombers Hitler had in 1941 had to take with them plenty of fuel and no bombs at all. If Hitler’s bombers had a sufficient radius of action, even then they could not have bombed the Urals. Germany was running out of fuel. In August 1941, it already had so little fuel that it had to halt large-scale operations.

If there had been enough fuel in October, November, and later on it could not have been delivered to the Volga-area airbases, which were not yet built anyway. Delivery of even one hundred tons of fuel, where there were no roads, across a distance of one thousand kilometers, demanded huge expenditure of fuel and of lubricant materials. Fuel transport had to run on something too. The tractors had to cross the steppes. Even if fuel had been supplied to the non-existing airbases, bombs had to be supplied as well. Thousands of tons of bombs were not enough for such an operation. But the delivery of even 100,000 tons of bombs to the non-existent air bases on the Volga would have required a tremendous amount of fuel.

In December 1940, when Hitler signed the directive for the attack on the Soviet Union, it was perfectly clear that the light single- and dual-engine bombers had too small a radius and too pathetic a bomb load, and were not fit for destroying industrial targets. At the same time, German bombers were flying from the excellent air bases in northern France, across the Channel, and bombing the industrial and military targets of London, Bristol, Coventry, Plymouth, and Southampton. Supplying fuel and ammunition from Germany to the airports of northern France was no problem. The targets were nearby, just across the Channel, and the planes could take less fuel and more bombs. Nonetheless, even in these most favorable circumstances, in nine months of intense bombing raids, from August 12, 1940, to May 12, 1941, all of Germany's aviation was still unable to "bomb British industry out of the war." If the entire German aviation could not in nine months destroy the industry of nearby Britain, how many months did Hitler plan to spend trying to destroy the industry centers of the remote Urals?

To destroy industrial regions situated in the deep rear of the enemy, an aggressor needs long-range bombers with a radius of action of several thousand kilometers and a bomb-carrying capacity of over five tons. The long-range bomber must also be a high-altitude bomber, otherwise it would be vulnerable to the enemy's anti-aircraft artillery. Also, is necessary a minimum of one thousand such bombers. Hitler had none. Even if Hitler had had long-range bombers, it would still have been impossible to use them. A four-engine bomber, carrying five tons of bombs at a multi-kilometer altitude for several thousands of kilometers, was extremely fuel-thirsty. Where would the fuel come from, if there was not enough even for fighters and light bombers?

Intelligence Reports and Stalin's Reaction

Stalin had three separate independent espionage services: the First Directorate of the NKGB; the Intelligence Directorate of the General Staff (in 1942 it became Chief Directorate); and Stalin's personal intelligence service, concealed under the name "Special Section of the Central Committee of the Communist Party."

The total power of these agencies was colossal. Sufficient information is available about the penetration into leading German military and political organs by Stalin's espionage services. A group under the code name "Viking" worked in the staff of the OKW (Supreme Command of the Armed Forces); seven high-ranking German officers and generals supplied information straight from Hitler's cabinet to Stalin's agents. In Germany, the Soviet military intelligence managed to gain access to the most secret information from the highest levels of power.¹

Several networks of agents simultaneously worked for Stalin, completely independent of each other. The lies of one were immediately exposed by information provided by the others. A group under the code name "Alta" worked in the German embassy in Moscow. Its members included Gerhard Kegel and Else Stoebe. The entire embassy was wrapped up in the web of Stalin's espionage. This group of agents "was supplemented by a man who had, in essence, unrestricted access to all [the] state secrets of Germany."² The German embassy in Moscow had ties to Goering's staff, to the science and technology organs of the Third Reich, and of course to the Ministry of Foreign Affairs. "Among these agents, there was even one of the closest associates of the foreign affairs minister, Ribbentrop. He was recruited in Poland to work for the British and in his convictions he was an adamant enemy of the Soviet Union."³ This agent, like many others, thought he was working against Stalin, when in reality he was working for him.

We must remember the friend of Goering's wife, the first-rate Nazi movie star Olga Tschechowa. This woman dazzled Berlin with her blinding beauty and her cruelty, which was inexplicable, unusual, and unseen even for that time. In 1936, on Hitler's orders, Olga Tschechowa was awarded the title People's Actress of Germany. She was often seen next to

Hitler at receptions. Then, in 1945, the popular Third Reich actress was befriended by Stalin and given the highest Soviet marks of distinction.

Stalin's espionage stretched far beyond the borders of the great powers. The Bulgarian Tsar Boris had an advisor, General Konstantin Lukash. Before each meeting with the tsar, the general prepared to answer any question the tsar could ask him. During the course of the preparations, Luben Lukash, the general's brother, played the role of the tsar, and asked the tsar's advisor the trickiest questions. The general had to answer quickly and precisely. As a result, the younger brother was just as informed as the tsar. He worked for the GRU, and asked his brother—the tsar's advisor—questions that interested Stalin.⁴

After World War I, Czechoslovakia was among the ten wealthiest and most developed nations in the world. The Skoda factories produced weapons of the highest world standards, primarily artillery. The daughter of the factory director, Blanca Karlikova, managed to sneak out blueprints of the 210-mm cannon and transfer them to the right person. She worked for the same group of agents that was working against the Bulgarian tsar.⁵

Testimonies about the might of Stalin's espionage abound. For example, Air Force Major General P. M. Stefanovsky recounted, as if it were something utterly insignificant, that in July 1941 he was summoned by Stalin and told: "In three days, the Germans will bomb Moscow."⁶ Stefanovsky described the measures that were taken, and in three days the first massive air raid on Moscow was deflected. But we can pause on this seemingly insignificant episode. How could Stalin have known that in precisely three days the Germans would bomb Moscow? The pilots at the air bases did not know what they would be doing the following day. It was always a secret. The success of the upcoming operation, the lives and safety of the pilots, depended on that secret. A very small group of people knew the plans for air war. Commanders of formations and pilots found out the targets they had to bomb only at the last moment. Yet Stalin knew not only what the German pilots would be doing the following day, but also what they would be doing in three days.

Anastas Mikoyan, member of the Politburo, also recounted an instance that demonstrated the extraordinary capabilities of Stalin's intelligence services. On March 27, 1943, at around two o'clock in the morning, Mikoyan was summoned to Stalin's dacha in Volynskoe. Stalin told him what the German command was planning for the summer of 1943.⁷ The Battle of Stalingrad had just ended. The Red Army made a thrust forward, but was stopped in the regions around Kharkov, Orel, and Belgorod. A balance of powers set in. Neither one of the sides could advance. Both sides switched to defense, and began intensive preparations for the summer battle that would unfold in these regions in another four months. The Battle of Kursk would be one of the bloodiest battles in human history. It began on July 5, 1943. But German generals began roughly planning the operation on March 13, 1943; on March 27, Stalin announced this fact to Mikoyan and ordered the secret preparation of the strategic reserve of the Steppe military district, consisting of eight armies, including one air and one tank guards army, for a defensive battle and for the following offensive operations. The Steppe military district was deployed behind the main alignment of Soviet troops, and at the critical moment of the battle it was transformed into the Steppe front.

Stalin was constantly peeking at Hitler's cards. During the development of German operations in the Kursk region, all details and all changes in the plan were immediately reported to Stalin. Before the beginning of the operation, German generals, who were the immediate

executors of the plans, received the appropriate directives and the final draft of the operation. Stalin had received this draft six days earlier.

Oddly enough, in 1941 Soviet spies reported to Stalin that Hitler was planning to attack, but Stalin did not believe them. Richard Sorge (agency covername—Ramzai) was a spy whom Stalin ordered to return to the USSR “for vacation” on July 29, 1938. He refused to return. In January 1940, he wrote to his Moscow contact: “I am grateful for your greetings and [good] wishes [for] my vacation. However, if I go on vacation, it will immediately reduce the information.” In May, he refused for the second time: “It goes without saying that we are postponing the date of our return home because of the present military situation. May we assure you once again that this is not the time to raise this question?” In October, he asked: “May I count on coming home after the end of the war?” It is a strange question. Every secret agent knows that after the war he will be allowed to return home. Moreover, they propose right now that he arrive for vacation. But Sorge refuses. What is going on?

A multitude of books and articles have been written about Sorge in the Soviet Union. Some of them overflow with praise: he was such a great intelligence officer, such a true Communist that he even spent his own money, earned in his difficult work as a journalist, on his illegal work. One of the Soviet weekly magazines⁸ published a report that Sorge had very important documents, but was unable to send them to the center, because the center had not sent a courier.

Meanwhile, Yan Berzin, the brilliant chief of Soviet military intelligence who had recruited Sorge, was executed after being horrendously tortured. Solomon Uritsky, another GRU chief who had personally given Sorge his instructions, was also executed. Lev Borovich (agency covername—Rozenal), deputy head of the 2nd department of the intelligence headquarters, direct supervisor to Sorge, was shot. Gorev, the Soviet illegal resident who had fixed Sorge’s passage from Germany, was in jail.⁹ Aino Kuusinen, Sorge’s secret collaborator who was the wife of the “president of the Finnish Democratic Republic” and of a future member of the Politburo of the Central Committee of the CPSU, was also in jail. Ekaterina Maksimova, Sorge’s wife, had been arrested, admitted to having links with enemies, and died in confinement in 1943. Karl Ramm, the illegal GRU resident in Shanghai and former deputy of Sorge, was summoned back to Moscow “for a vacation” and executed. Sorge received the order to come back for a vacation and refused to travel to the Soviet Union. Undoubtedly, Sorge guessed what was awaiting him in Moscow.

These discrepancies are explained easily: Sorge became a defector. At that time, a more precise term was invented—a malevolent defector. That was why he was paying agents out of his own pocket—the center stopped funding him! Not wishing to return to a hasty trial and certain death, Sorge continued to work for the Communists, but now no longer in the role of a secret agent, but rather as an amateur informer, not for money but for his own satisfaction. Sorge calculated that after the war his superiors would understand that he only told them the truth, and they would pardon him and appreciate his work. The center did not lose contact with him until the end. It accepted his telegrams, but apparently only to urge him: “come home, come home, come home,” to which Ramzai replied “too busy, too busy, too busy.”

Stalin did not trust Richard Sorge, because he was a defector with a capital sentence hanging over his head. Someone had invented the legend that Richard Sorge supposedly submitted highly important information about the German invasion to the GRU, but

nobody believed him. Sorge was a very able intelligence officer, but he told Moscow nothing of significance about the German invasion. What was more, he fell victim to disinformation and fed the GRU false reports. On April 11, 1941, he sent Moscow a telegram: "The representative of the [German] General Staff in Tokyo has stated that war against the Soviet Union will begin immediately after the war in Europe ends."

Hitler prepared the invasion, spreading lies that looked very much like the truth. Hitler knew that it had already become impossible to conceal his preparations to invade the Soviet Union. Therefore, he said in secret, in a way that Stalin could hear, "Yes, I want to attack Stalin . . . after I have finished the war in the west." If Sorge's telegram from April 11 (and other similar telegrams) were to be believed, there was no need to worry: the war against Great Britain was going on with no end in sight.

The GRU did not need Sorge. Based on extensive studies of all the economic, political, and military aspects of the situation, the GRU concluded that Germany could not win a war on two fronts; Hitler would not begin a war in the east without first finishing the war in the west.¹⁰ The first conclusion proved correct; the second did not.

Even before Sorge's "warning," the new head of the GRU Lieutenant General F. I. Golikov submitted a detailed report to Stalin on March 20, 1941, which concluded that "the earliest possible date on which operations against the USSR may begin is the moment following victory over England or after an honorable peace for Germany has been achieved." But Stalin knew this simple truth without Golikov having to tell him. Stalin replied to Churchill's letter from June 25, 1940, that Hitler might begin a war against the Soviet Union in 1941 if Britain had ceased to resist by that time.

But Hitler, whom Stalin had driven into a strategic impasse by the Molotov-Ribbentrop Pact, suddenly realized that he had nothing to lose and that inevitably Germany had two fronts: if he did not attack Stalin, Stalin would stab him in the back. Therefore, Hitler attacked first. Neither Golikov nor Stalin anticipated this. It was a suicidal decision, but Hitler had no choice. Stalin simply could not understand that having found himself in a strategic impasse, Hitler would take such a suicidal step. General Golikov, head of the GRU, had not contemplated that either. Sorge (and several others) simply confirmed this view with the false information in their telegrams.

Some argue that later, on June 15, 1941, Sorge correctly named the date of the German invasion as June 22. But was Richard Sorge to be believed? First, he had said that Hitler would not fight against Stalin without finishing the war against Great Britain, and then, soon after, reported a date for the invasion, June 22, thereby saying that Hitler would invade the Soviet Union after all without ending the war against Britain. Sorge's reports canceled each other out.

Intelligence is the most thankless work in the world. Those who fail and get hanged—like Sorge, for example—become famous. Stalin also had military intelligence officers whose achievements were truly outstanding, but precisely because they were so successful, they remain unknown to us. One Soviet intelligence officer had access to some of Hitler's real secrets. According to Marshal of the Soviet Union A. A. Grechko, "eleven days after Hitler approved the final plan for the war against the Soviet Union (December 18, 1940), this fact and the basic details of the decision taken by the German High Command became known to our intelligence organs."¹¹

In December 1940, Lieutenant General F. I. Golikov, chief of the GRU, reported to Stalin that, according to confirmed reports, Hitler had decided to attack the Soviet Union without waiting for the war in the west to end. This highly important document was discussed in early January in a very close circle in the Soviet High Command in Stalin's presence. Stalin did not believe the document, and said that any document could be forged. Stalin demanded of Golikov that he organize Soviet military intelligence so that it would know at any moment whether Hitler was really preparing for war or just bluffing. Golikov reported that he had already done this. The GRU was attentively following a whole range of aspects of German military preparations, and from these the GRU would accurately identify the moment when preparations for invasion would begin. Stalin asked Golikov to explain how he would know this. Golikov answered that he could only tell Stalin personally and not anyone else.

Subsequently, Golikov regularly reported to Stalin personally, and each time he told him that the preparations for invasion had not yet begun. Golikov knew about the massive concentration of German troops on Soviet borders, about the huge ammunition supplies, about the movements of the German air force, about German defectors, and about many other things. He was informed about the numbers of nearly all German divisions, the names of their commanders, and their locations. He knew many important secrets, including the name of Operation Barbarossa and the time of its inception. Even on the eve of the invasion, however, Golikov reported that preparations for invasion had not yet begun, and without these preparations it was not possible for Germany to begin the war.

When the war broke out, Stalin sent Golikov on a trip to Britain and the United States and briefed him personally. Golikov was then put in command of armies and fronts. In 1943, Stalin appointed him to the crucial post of Deputy People's Commissar for Defense, which was deputy to Stalin himself, to deal with cadre matters. Stalin allowed only his most trusted men to handle the delicate task of selecting and placing cadres. Golikov continued to rise in rank after Stalin's death, and eventually became a Marshal of the Soviet Union.

Golikov's impunity for obviously wrong intelligence had been worrying me personally for a long time, until I attended a lecture in the Academy of the GRU. Later, when I was working in the central apparatus of the GRU, I found confirmation to this answer.

Golikov used to report to Stalin that Hitler was not preparing for war against the Soviet Union. It turned out that Golikov was reporting the truth to Stalin, since Hitler was not making such preparations. Golikov knew that Stalin did not trust documents. Golikov did not trust them either. He therefore looked for other indicators which would unerringly signal the moment when Hitler began his preparations for war with the Soviet Union.

All GRU agents in Europe were ordered to infiltrate organizations directly or indirectly connected with sheep farming. Over a few months, intelligence was gathered and carefully processed on the number of sheep in Europe, on the main sheep-breeding centers and slaughterhouses. Golikov was informed twice a day about mutton prices in Europe. In addition, Soviet intelligence began to hunt for dirty cloths and oil-stained pieces of paper left behind by soldiers cleaning their weapons. There were many German troops in Europe. The troops were stationed in field conditions. Each soldier cleaned his weapon at least once a day. Cloths and paper which have been used for weapon cleaning were usually either burned or buried, but of course this rule was not always obeyed. The GRU had ample opportunity to collect an enormous quantity of dirty cloths. A large number of these dirty cloths were sent across the

frontier wrapped around various iron implements, so as not to arouse suspicion. Larger-than-usual quantities of kerosene lamps, primus stoves, and lighters were sent across the border, by both legal and illegal means.

Every piece of information was analyzed by hundreds of Soviet experts, and the results reported immediately to Golikov. He immediately informed Stalin that Hitler had not yet begun preparations to invade the Soviet Union, so there was no need to pay attention to every buildup of German troops or German General Staff documents.

Golikov believed, with good reason, that a country needed serious preparation to fight the Soviet Union. One of the vital things Germany would need, if it were to be ready to fight such a war, was sheepskin coats—no fewer than six million of them. As soon as Hitler decided to attack the Soviet Union, his General Staff would have to order industry to begin producing millions of sheepskin coats. This would be reflected immediately on the European markets. In spite of the war, mutton prices would fall because of the simultaneous slaughter of millions of animals, while sheepskin prices would rise sharply.

Golikov also calculated that the German army would have to use a new type of lubricating oil for its weaponry. The usual oil used by Germany would congeal in the frost, component parts would freeze together, and the weapons would not work. Golikov waited for the German army to change the type of oil it used in weapon-cleaning. The Soviet experts' examination of dirty cloths showed that the German army was still using its usual oil, and there were no signs of a change to a new type.

Soviet experts also watched motor fuel. In heavy frost, the normal German fuel broke down into incombustible components. Golikov knew that if Hitler decided to open a second front, he would have to order the mass production of a fuel which would not disintegrate in heavy frost. Soviet intelligence was sending samples of German liquid fuel across the border in lighters and lamps. There were many other indicators, which the GRU followed closely for warning signals.

But Hitler launched Operation Barbarossa without making any preparations. Stalin, therefore, had no reason to punish Golikov. Golikov had done all that was humanly possible to discover German preparations for war. He told Stalin that no preparations were taking place, and this was the truth. There had only been a great buildup of German troops. Golikov gave instructions that not all German divisions had to be targets of attention, but only those that were ready to invade; those were divisions that had 15,000 sheepskin coats in their depots. There were simply no such divisions ready for war in the entire *Wehrmacht*.

The GRU chiefs knew where, what quantities, and what kinds of liquid fuel and lubricating oils were produced in Germany and the occupied territories. The quantities of liquid fuel possessed by Hitler were not at all sufficient to conduct deep offensive operations. But the most attention was paid to the type of fuel they produced. Analysis showed that Germany was not conducting intensive research in the field of creating frost-resistant fuels and oils; German industry was not producing them in any significant quantity; the rear units of the *Wehrmacht Heer* and the *Luftwaffe* were not storing such fuel and oil for a grand-scale war.

The temperature at which pure benzene crystallizes is 5.4 Celsius. In Germany, fuel was obtained by the hydrogenation of low-quality coal. Into this fuel, large quantities of benzol had to be added to raise the levels of octane. Benzol has high anti-detonation qualities. However, it drastically reduces low-temperature qualities. The temperature of crystallization for the main kinds of German fuels ranged between -9.6 and -14.5 Celsius. Only a madman

could begin a war with such fuel against a country where in the winter a temperature of –20 Celsius was the norm. Soviet intelligence did not consider the German generals to be madmen, and it concluded that Germany was not preparing for war.

Hitler's soldiers also needed boots, warm underwear, sweaters, special tents, hats, heaters, skis, ski wax, masking robes, oil and lubricants that would not freeze, devices for heating water, frost-resistant car batteries, and winter fuel for tanks, cars, and airplanes. They needed tanks with broad caterpillar tracks, thousands of cars that could drive in poor road conditions, and so on. They had none of these. Their lack of preparedness was total, shameful, and scandalous. The argument was that Hitler did not need coats, because he planned to end the war in three months. However, he still needed to prepare for winter. . . . Hitler's Colonel General H. Hoth, commander of the 3rd Tank Group, wrote: "The objective of destroying the centers of the war industry located farther east was delegated to the air force. These were utopian plans. The radius of action of German bombers then was one thousand kilometers. Even if it had been possible to reach the projected Volga-Arkhangelsk line (which was planned for one campaign, i.e., three to four months), the radius of [the] bombers was not sufficient to disrupt the functioning of industry in the Ural and the Sverdlovsk regions. And even Sverdlovsk is not the end of the world."¹²

Colonel General H. Guderian, commander of the 2nd Tank Group, recounted: "When they unfolded a map of Russia before me, I could not believe my eyes. Everything that I considered impossible I was supposed to make into reality?"¹³ Guderian knew that Germany couldn't defeat the Soviet Union. Defeat was impossible not only in three months, but in general.

"Just look at these vast territories," said General Field Marshal Karl von Rundstedt, Commander of Army Group South. "We cannot crush the enemy and occupy all of western Russia from the Baltic to the Black Sea in just a few months."¹⁴

Stalin and Golikov reasoned in a similar manner. They all expected Hitler and his field marshals to behave reasonably—in other words, to prepare for a prolonged war, including a war in winter. But reasonable actions were not being taken.

The War Has Begun

Only now did we realize how well the Russians had been prepared for war.

—ADOLF HITLER, RADIO ADDRESS, OCTOBER 3, 1941

During April, May, and the first half of June 1941, German reconnaissance planes flew “by mistake” over the western regions of the Soviet Union. Stalin ordered not to shoot them down. At the same time, Soviet planes, also “by mistake,” flew over territory occupied by German troops.

Both regular pilots and commanders were flying “by mistake” over German territory. Commander of the 43rd Air Force Fighter Division of the Western special military district, Major General G. N. Zakharov, remembered flying in the sky and looking at German troops: “An impression formed that some sort of movement was originating deep within the territories, which was halted only at the edges of the border, and was held by it, as if by an invisible barrier, ready to flow over the edge at any moment.”¹ The German pilots flying then over Soviet territory viewed the same picture.

The predicament of General M. F. Lukin demonstrates the full tragedy of the situation. As an army commander, he had already fought in Ukraine in the vicinity of Shepetovka, while the staff of his army still remained in the Trans-Baikal. The trains carrying his army stretched across thousands of kilometers. The worst situation was when a train had to stop in the middle of the fields instead of at a station. A tank battalion is a formidable force, but in a train it is completely defenseless. If the war found a train carrying heavy armor in a place where there were no facilities for unloading, the train either had to be destroyed or abandoned. Those divisions that didn’t advance to the border in trains weren’t in a better position. A division marching in columns was a great target for air force raids. The entire Red Army presented one great target.

In his memoirs, the German pilot Hans-Ulrich Rudel described the beginning of the war against the Soviet Union. He flew a Ju-87 and completed 2,430 battle missions.

By the evening of the first day I had completed four trips beyond the frontline to the area between Grodno and Vokovysk. We saw huge masses of tanks and trucks here. We mostly saw KV-1, KV-2, and T-34 tanks. We bombed tanks and anti-aircraft guns. . . . The next day, we first flew out at 3 AM, and finally returned at 10 PM. One had to forget about normal rest during the night, so we made use of every available minute to fall down on the grass by our airplanes and to sleep. . . . Even on my first mission, I noticed innumerable fortifications built along the borderlines. They stretched for many hundreds of kilometers deep into Russian territory—and yet, they were partly unfinished. We flew over unfinished airbases: in some places, the concrete landing strips were just being constructed. Even at such airbases, however, one could find a few aircraft waiting. We saw, for example, along the road to Vitebsk, which our troops were advancing upon, one such almost-finished airbase with many “Martin” bombers. They either did not have enough fuel or enough crews. While flying over these numerous airbases and fortifications, we all had the same thought in our heads—how lucky we were to have struck first. It seemed that the Soviets were feverishly readying the groundwork for an attack against us. And which other Western country could Russia have attacked? If the Russians had completed their preparations, there would have been almost no hope of stopping them. . . . The highway [from] Smolensk [to] Moscow was the target of many raids; it was packed with huge amounts of Russian military equipment and supplies. Trucks and tanks were lined up one after another almost without any intervals, often in three parallel columns. If all this massive machinery had attacked us. . . . There were no difficulties in attacking so enticing a target. In a few days, the entire road was transformed into piles of rubble.²

In the German pilot’s description, there is one phrase about the construction of defense structures that might create some confusion. Perhaps the Red Army was preparing defenses? No, it was not. If it had been preparing for defense, the arriving troops would not have been kept in columns along the roads, they would have been sent immediately to the trenches. Rudel also mentioned the “Martin” bombers. Indeed, military supplies from the United States and Great Britain began to arrive in the Soviet Union long before June 22, 1941.

“Strategic defense was born out of necessity during combat, it was not planned ahead of time,” says official Soviet military-historical research.³ The defensive operations of the Red Army in the summer of 1941 were pure improvisation. Before the war, the Red Army neither prepared for defense nor conducted any training in defensive operations. Soviet field manuals don’t contain a word about defense on a strategic scale. Not only did the Red Army not have any defense plans, but even in a purely theoretical sense the issues involved in conducting defense operations were never worked out or discussed.

Moreover, the Soviet people and army were not ready for defense, even psychologically. “It is precisely the interests of defending the USSR that will demand the conduct of broad offensive operations on enemy territory, and this does not in any way contradict the character of defensive war,” wrote *Pravda* on August 19, 1939. From the first moments of the German invasion, the Red Army tried to go on the offensive, or carry out counterattacks and counteroffensives. But this was also improvisation. Counteroffensives were not worked out at any of the prewar training exercises; they were not even discussed in theory: “The question of counteroffensive . . . was not posed before the Great Patriotic War.”⁴

Before the war, the Soviet command prepared neither for defense nor for counterattacks. The Soviet Union planned a different kind of war. Marshal A. M. Vasilevsky reported that during the last year before the war the officers and generals of the General Staff and the staffs of the military districts and fleets worked fifteen to seventeen hours a day without holidays or vacations. Marshals Bagramian and Sokolovsky; Generals Shtemenko, Kurassov, and Malandin; and many others have confirmed that information. General Anissov and General Smorodinov reportedly worked twenty hours a day.

In February 1941, General G. K. Zhukov became the Chief of General Staff of the Red Army. From that time, the General Staff in essence began to operate on a wartime regime. Zhukov himself worked very hard, and did not allow anyone else to relax. The veterans of the General Staff remembered Zhukov's reign as the most frightening period in history, more frightening than the Great Purges. At that time, the General Staff and the other staffs were working with inhuman intensity. Then the Germans invaded. Every commander, starting with regiment level and higher, had in his safe a so-called "Red Packet," which contained the plans for war. The commanders opened their "Red Packets," but they did not find in them anything useful for defense. "Of course we had detailed plans and orders about what was to be done on day "M" . . . everything was written to the minute and in great detail. . . . All these plans existed. But, unfortunately, they did not say anything about what was to be done if the enemy suddenly went into attack."⁵

Something else is unclear. If the Red Army entered the war without any plans, then Stalin, upon finding out about this, should have shot the chief of general staff and all those who participated in developing the plans. This did not happen. On the contrary, those who participated in developing Soviet plans—Vassilevsky, Sokolovsky, Vatutin, Malandin, Bagramian, Shtemenko, and Kurassov—began the war as major generals or even lieutenant colonels, and ended it as marshals or at least with the four stars of army generals. During the war, they all proved to be truly great strategists. They were all devoted, even pedantic, staff officers, who could not imagine life without a plan. If Soviet staffs worked very hard and developed war plans before the war, but those were not defense or counteroffensive plans, what kinds of plans could they be?

The Soviet Black Sea fleet had the following military objective before the war: "active military actions against enemy ships and transports near the Bosphorus and on the passageways to the enemy's bases, as well as cooperation with land troops during their movement along the Black Sea coast."⁶ Admiral S. Gorshkov remembered that the Baltic and Northern fleets, as well as the Black Sea fleet, had purely defensive objectives, but they were to be achieved through aggressive methods. The actions of the Soviet fleet during the first minutes, hours, and days of the war showed with sufficient clarity that they had plans, but these were not plans for defense. On June 22, 1941, Soviet submarines from the Black Sea fleet immediately sailed into the sea toward the shores of Romania, Bulgaria, and Turkey. On that same day, the submarines of the Baltic fleet sailed toward the shores of Germany with the objective of "sinking all enemy ships and vessels according to the rules of unrestricted submarine warfare."⁷ The order made no exceptions, not even for medical vessels sailing under the Red Cross flag.

Starting on June 22, the Black Sea naval air force conducted open military actions in the interests of the Danube military flotilla with the objectives of opening the way for it to advance upward along the river. On June 25 and 26, the Black Sea fleet's cruisers appeared in the vicinity of the Romanian port of Constanta and carried out an intensive artillery raid

with the goal of landing assault troops on the shores. At the same time, the Danube military flotilla began assault operations in the Danube river delta.

The garrison of the Soviet naval base Hanko, located on Finnish territory, did not switch to a defensive regime after the start of hostilities, but instead began intensive assault operations, taking over nineteen Finnish islands in the course of several days.⁸

On June 25, despite losses suffered by Soviet air forces during the first days of the war, airplanes of the Northern Front carried out a surprise bombing raid. The staff of the Northern Front reported on that morning: "The air force of the front and of the armies started on 6:20 AM to carry out, by bomber formations, the task of exterminating the enemy's air force on his airfields."⁹ The enemy's name is spelled out in the report which the staff issued later that same day: "Bombed were all known airfields of the southern part of Finland."¹⁰ The Germans, who happened to have invaded the USSR three days before, are not mentioned in the reports. This means that the USSR, without declaring war and in violation of the peace treaty it signed with Finland just a year earlier, committed an unprovoked act of aggression against its neighbor. Would somebody explain why this crime against peace was not a part of the Nurnberg indictments?

On June 23, the 1st Long-range Bomber Aviation Corps carried out a massive attack against military targets in Koenigsberg and Danzig. This was no improvisation. On the morning of June 22, at 6:44 AM, the Soviet long-range bomber air force received orders to act according to the plans.¹¹ For several days, it tried to carry out these orders. On June 26, 1941, the 4th Long-Range Bomber Aviation Corps began to bomb the Ploiești oil fields in Romania. After just a few days of raids, the amount of oil obtained in Romania was reduced almost in half. Even when the Soviet air force sustained unimaginable losses at its bases, it had managed to wreak huge damage on the Romanian oil industry. Under any other circumstances, the Soviet air force would have been much more dangerous and could have fully paralyzed the entire German military, industrial, and transportation capacities through its actions against the oil-producing regions. Hitler understood the threat all too well, and saw an invasion of the USSR as his only possible defense. Of course, even that did not save him.

On June 22, 1941, the 41st Rifle Division of the 6th Rifle Corps of the 6th Army, without waiting to hear orders from higher commanders, acted according to prewar plans and crossed the state border in the Rava-Russkaya region. The 102nd Rifle Regiment of this division crossed the border on a front line of eight kilometers and penetrated four to six kilometers into enemy territory. In the morning of June 22, 1941, the commander of the Northwestern Front, Colonel General F. I. Kuznetsov, without awaiting orders from Moscow, issued an order to his troops to attack Tilzit in Eastern Prussia. For the Northwestern Front's staff, for the commanders of the armies and their staffs, this decision was not at all surprising: an attack on Tilzit had been worked out in training exercises just days earlier and "was very familiar to the formations commanders and their staffs."¹² Colonel General Kuznetsov simply put the prewar plans into action. On the evening of that same day, the Soviet high command, not yet knowing about General Kuznetsov's actions, ordered him to do exactly what he had already begun doing: to attack Tilzit in Eastern Prussia.

The High Command also ordered the neighboring Western Front to carry out a powerful attack on the Polish city of Suvalki. This was no surprise to the Western Front commander General D. G. Pavlov. He knew the objectives of his front long before the directives from Moscow arrived, and had already issued the orders to advance on Suvalki. However, because

the German air force had not been destroyed in a surprise raid but, on the contrary, the entire Soviet Western Front had lost 738 planes during the first hours of the war, advancing was not at all the best option. The Western Front, its command, staff, the army commanders and the chiefs of their staffs knew long before the war that their primary objective was the encirclement of the German formations in the vicinity of Suwalki. A Soviet attack on Suwalki had been prepared long before the war. The objective had been identified by all Soviet commanders. Of course, the lower-ranking commanders had no right to know the tactical levels of these objectives, but in the higher staffs they were clearly formulated, sealed in secret envelopes and kept in safes in all headquarters, even those of the battalions. For example, the reconnaissance battalion of the 27th Rifle Division, concentrated along the border near the city of Augustow, was getting ready to deploy reconnaissance forces around Suwalki.¹³ Its objective was to secure a rapid advance of the entire 27th Rifle Division from Augustow on Suwalki.

Long before the war, huge masses of Soviet troops were gathered in the regions around Augustow. Here, on Soviet territory, the Augustow canal stretched parallel to and right along the border. If the plans had been made for defense, the troops should have been positioned behind the canal, so they could use it as an obstacle, an anti-tank trench. But the Soviet troops were shipped across the canal to its western shores and positioned on a thin strip of land between the canal and the border from which barbwire had already been removed. At dawn on June 22, thousands of Soviet soldiers were killed here by sudden and lethal enemy fire. With the canal behind them, the troops had nowhere to retreat.

The German troops on the other side of the border were also gathered in huge masses right along the border, and had also taken down the barbwire. If the Red Army had attacked a day earlier, the losses on the other side would have been just as great. The positioning of troops right along the border was extremely dangerous if the enemy attacked suddenly. But such a positioning was extremely convenient for carrying out a sudden attack.

Soviet generals never concealed the fact that strictly offensive objectives were set before them. General K. Galitsky, when talking about the concentration of Soviet troops in the Augustow region, stressed that the Soviet command did not believe in the possibility of a German attack, while the Soviet troops were being prepared to conduct an offensive operation.

The Soviet fronts directed against Eastern Prussia and Poland, as well as the fronts positioned against Romania and Hungary, were preparing strictly for an offensive. Major General A. I. Mikhalev acknowledged that the Soviet command did not plan to use the Southern and Southwestern fronts for defensive or counteroffensive actions. "The strategic goals were planned to be attained through the troops' switching to a decisively offensive course of action."¹⁴

The actions of the Red Army during the first days of the war speak best about Soviet intentions. General Zhukov coordinated the actions of the Southern and Southwestern fronts during the first days of the war, which were aimed at Romania and Hungary. Up until June 30, 1941, Zhukov insisted on advance and demanded that the commanders of the fronts exclusively attack. It was only in July that he and his colleagues concluded that the armies could no longer attack.

It is interesting to look at the Red Army's preparations for war through the eyes of those who were posted right on the border, especially on the Romanian border, because the most significant assault was supposed to take place there. Many books have been written about that time period. In June 1941, Hero of the Soviet Union Major General A.

A. Sviridov commanded the 144th Separate Reconnaissance Battalion of the 164th Rifle Division of the 17th Rifle Corps of the 12th Army posted in the Lvov-Chernovits bulge, on the Romanian border. The 17th Corps was in essence a mountain rifle corps. And the entire 12th Army was, in fact, a mountain army. Sviridov wrote of June 19, 1941: "Our division replaced border guards at the river Prut. Leaving the state border, they handed a fortified shoreline to us." From the Romanian side "we heard the cries from Romanian villages: the peasants were being relocated further away from the borders." "All of us, Soviet warriors were preparing to fight the enemy only on his lands."

Meanwhile, from June 13 to 20, the NKVD troops were relocating by force the population of the border regions from the White Sea to the Black Sea. The Germans relocated people from a strip of land twenty kilometers in width, while the Soviets removed people from land one hundred kilometers wide. The Germans relocated the population. The Soviets relocated some people and sent others to the GULAG. On June 19, the day described by Sviridov, the NKVD operation to clear the front strip entered its bloodiest stage.

After the forced deportation of the population, the border guards dismantled all mines and barbed wire obstacles on the Soviet border, and left the borders themselves. On strips tens of kilometers long, in the places where the Soviet assaults were being prepared, the border was opened, and the border guards had left, having handed the borders over to the Red Army. The reconnaissance battalions of the Soviet divisions came out right up to the borders.

Many years before the war in 1941, Shaposhnikov said that the "transfer of armies to wartime positions creates an obvious elevation in their military valiance and their morale." Shaposhnikov warned, however, that an army put on wartime regime and moved to the borders experienced nervous tension that couldn't be contained. Shaposhnikov also cautioned that the army couldn't be kept at the borders for long; it had to be brought into action. Stalin read Shaposhnikov's book with great care, knew it well, and often quoted it. In May 1940, Shaposhnikov was promoted to the rank of Marshal of the Soviet Union. Officially, he was a deputy of the People's Commissar for Defense, but in practice he was Stalin's number one military advisor. By the middle of June 1941, Soviet armies were moved to the borders. The Soviet High Command knew that the commanders and soldiers were eager to enter combat, and that their assault drive couldn't be contained.

The Red Army was not separated from the enemy even by a thin line of NKVD border guards. Neither Zhukov, nor Timoshenko, nor Shaposhnikov had the power to order the guards to leave the borders. The guards were not under their jurisdiction. The guards were subordinate to Beria, the NKVD commissar. But Beria did not have the power to order the army units to replace his people on the borders. Only one man, Stalin, could have ordered the NKVD commissar to remove the border guards and the Defense commissar to move the army divisions to the borders.

Then, the unexpected happened. The German army attacked. Let's examine the consequences of the attack using the example of the 164th Division in which Sviridov served as battalion commander. There are two rivers in this region: the border river Prut, and the river Dniester that runs parallel to it on Soviet territory. If the division had been preparing for defense, there was no reason to move to the land between the two rivers; it would have been logical to dig trenches on the Dniester's eastern shores, using both rivers as water obstacles. Bridges should have been prepared for detonation. There should have been no supplies, hospitals, large army units, and headquarters stationed in the land between the two rivers, only

small groups of demolition experts and sappers. But the 164th Division (like all the others) was preparing for an invasion, so it crossed the Dniester, carrying with it hundreds of tons of ammunition, fuel, and supplies, as well as its headquarters, hospitals, and communication units, and stopped at the last border—the river Prut. There were 15,000 soldiers in the division, many cannon, many shells, and many cars. There were other divisions nearby, and all of them were between the two rivers—the Dniester was behind them, and the border river Prut ahead.

The Germans attacked, took over the bridge across the border river—the bridge was not mined—and began to send their units across. They bombed the bridges behind the Soviet divisions. To the north of this strip, the German 1st Tank Group broke through and encircled the Soviet front, cutting the Soviet troops off from their rears. The Soviet divisions were trapped. Masses of people and weapons (the 96th Mountain Rifle Division, 13,000 men strong, was also there) were in this trap. Nobody had prepared defenses, dug trenches or foxholes. Retreat was impossible—the Dniester was behind them, with no remaining bridges. A massacre followed.

Sviridov looked across the river Prut to the border bridge, and saw unending streams of German troops move across it. He remembered: “The bridge! We kept it in order to advance, and now we can’t blow it up. . . . All my military training was mostly done under the motto: only advance! Retreat was considered shameful, and we were not taught how to retreat. Now, when we were forced to retreat, we had no experience. We had to learn this art under terrible enemy fire.”

During the war, especially in the beginning, the Red Army suffered many defeats. In August and September of 1941, a military catastrophe of historical proportions occurred in the region around Kiev: 665,000 Soviet troops were encircled and captured by the German army. Near Smolensk, 310,000 Soviet soldiers and officers were surrounded. In 1942 on the Crimean front: Soviet troops were encircled near Khar’kov; the 2nd Shock Army, headed by General Vlasov, was surrounded and exterminated.

This kind of information was considered classified. Soviet historians and generals never wrote about these events. But there was an exception to the rule: June 22, 1941. The Soviet propaganda described without mercy everything related to that day, and denounced the Red Army before the entire world. Why was it allowed to talk about the lack of readiness for war?

In the library of the Military-Diplomatic Academy of the Soviet Army, I stumbled across a very small book. It was titled *A Brief Russian-German Military Phrase Book for Soldiers and Junior Commanders*. The booklet was published in Moscow on May 29, 1941, and additionally on June 5 the same booklet was published in Leningrad, Minsk, and Kiev. In total, five million copies were printed. In all Soviet books, including military textbooks, the price was on the last page. The price was not printed only on those books and instructions that related to the conduct of battle. These publications were treated like ammunition, and were handed out to the troops during training exercises, and, when necessary, before and during battle. No price was stamped on the little book I found. It was a battle document; it proved that the USSR was preparing for the war with Germany.

The phrase book was composed very simply and intelligently: a question in Russian, followed by the same question in German written in Russian letters, then in German in Latin letters. The answers were also printed in Russian and German with Latin and Cyrillic letters. It is quite simple to speak according to the booklet—if you do not know how to pronounce

the needed German phrase, simply point to the corresponding lines in the book and the Germans can read them themselves. The phrases are very interesting. For example: “Where is the water? Is it drinkable? Drink it first yourself.” Imagine the situation: the Soviet soldiers are fighting, defending their motherland, enter a Russian village, take out the phrase book from their packs and read syllable by syllable: “*Trinken Sie zuerst man selbst!*” But they would be taken for Germans in Russia! Here is another example: “What is this station called? Stop the broadcast, or I will shoot you! Bring the conductor! Where is the fuel? Where is the garage? Gather and bring here [so many] horses [farm animals], we will pay!” To communicate with the local populations, it is not a bad idea to know phrases such as: “Where are the German soldiers hiding? Where is the burghermeister? Is there an observation point on the steeple?” But, there was not one burghermeister or steeple in the Soviet Union. Another very important question: “Where are the stores?” The most important phrases are the following: “You do not need to be afraid! The Red Army will come soon!”

A former Soviet diplomat, Nikolai Berezhkov, who accompanied Molotov to Berlin in 1940, wrote in his memoirs *With a Diplomatic Mission in Berlin* that a German printing press worker once brought to the Soviet embassy a German-Russian phrase book of the same kind. For the Soviet embassy, the book was solid proof that the German army was preparing to invade the USSR. But in the USSR they were printing the same exact phrase books.

Soviet soldiers and officers were preparing for a victorious march on Berlin, but the war against Germany in 1941 didn't run according to plan. As a result, when Soviet commanders were captured, the Germans found quite interesting maps and curious orders in their bags. Thousands of soldiers had Russian-German and Russian-Romanian phrase books. Many simply did not think of the necessity to get rid of this compromising evidence.

The commander of the 5th Battery of the 14th Howitzer Regiment of the 14th Tank Division of the 7th Mechanized Corps, Yakov Iosifovich Dzhugashvili, son of Stalin, was no exception. He was taken prisoner, but at first he was not recognized. The senior lieutenant was betrayed by his subordinates. Stalin's son was searched and questioned. A letter was found in his pockets, from a certain junior lieutenant in the reserves named Victor: “I am at the training camps, I would like to be home by fall, but the planned walk to Berlin might hinder this.” The letter is dated June 11, 1941. The contents of this letter were reported to Hitler personally; he mentioned it on May 18, 1942.¹⁵ In June 1941, German intelligence officers showed the letter to Yakov Dzhugashvili and asked him to clarify the statement about the “planned walk to Berlin.” The questioning protocol recorded Stalin's son's reaction. He read the letter and quietly muttered: “Damn it!”

During questioning, Stalin's son was asked why the Soviet artillery, which had the best cannon and howitzers in the world, and in incredible numbers, fired so poorly. Stalin's son answered: “The maps let the Red Army down, because the war, contrary to expectations, unfolded to the east of the state border.”¹⁶ Stalin's son told the truth. In 1941, the Red Army fought without maps. There simply weren't any. But the artillery couldn't fire without maps. Direct aiming and firing was just a small fraction of the work done by artillery in war. Most of the time artillery fired beyond the horizon.

“It turned out that in Soviet Russia a map-making industry was created that surpassed everything that had ever been done before in its size, organization, volume, and quality of work,” concluded the Germans about the Soviet topographic services.¹⁷ How do we reconcile the best map-making industry in the world with the complete absence of maps? Lieutenant

General A. I. Lossev explained: "Storages of topographic maps, located unreasonably close to the border, were either seized by the enemy, or destroyed by the enemy during the first bomb raids. As a result, the troops lost 100 million maps."¹⁸

This is a modern-day evaluation, and the numbers are lowered. Lieutenant General M. K. Kudryavtsev, who under Stalin was director of the topographic services of the Red Army, said that during the first days of the war, and only in the Baltic, Western, and Kiev military districts, the Soviet troops destroyed during retreat over two hundred railcars of their own topographic maps.¹⁹ The smallest cargo railcar in the Soviet Union in 1941 could carry twenty tons. Even if we supposed that the smallest cars were used to store the maps, four thousand tons of maps were destroyed in the three districts. Kudryavtsev said that, on average, every railcar contained 1,033,000 maps. Two hundred cars equaled 200 million maps. Which of the two generals is right? They both are. One talked about what the German troops destroyed, 100 million, and the other added that the Soviets themselves destroyed 200 million maps, so they would not go to the enemy.

If the Soviet army planned to defend Moscow, Kursk, and Stalingrad, it needed maps of those regions. There was no reason to transport these maps to the state border. At the border, the army needed maps of border regions. And, if there was a plan to advance, the army needed maps of the territories that lay ahead. If the Soviet Union planned to take over large territories, it needed the corresponding number of maps to supply a multimillion-strong army. The Red Army did not save its maps in the border regions, because they were useless for defending the country. In 1941, the plans for the "liberation" of Europe crumbled, and the value of the maps that were kept in railcars on the border became zero. Millions of Russian-German and Russian-Romanian phrase books were burned along with the maps.

The Soviet population was expecting a war, but it didn't anticipate a German invasion. Therefore, once the Germans attacked, everyone was shocked. Major General of the KGB O. D. Gotsiridze remembered: "Before July 3, when Stalin made a public appearance, it was completely unclear as to what we were to do. Everyone had thought that the war would be quick and on foreign soil."²⁰

"The complete demoralization among our troops occurred because . . . the people had planned to fight on the enemy's territory, and our military commanders were dreaming of a blitzkrieg no less than the Germans were. But everything turned out not quite so happily. . . . The sudden need for defense turned into a total retreat on all fronts for the troops and the people."²¹

Stalin's Panic

It is very fortunate for Russia in her agony to have this great rugged war chief at her head. He is a man of massive outstanding personality, suited to the sombre and stormy times in which his life has been cast; a man of inexhaustible courage and will-power and a man direct and even blunt in speech, which, having been brought up in the House of Commons, I do not mind at all, especially when I have something to say of my own. Above all, he is a man with that saving sense of humour which is of high importance to all men and all nations, but particularly to great men and great nations. Stalin also left upon me the impression of a deep, cool wisdom and a complete absence of illusions of any kind

—WINSTON CHURCHILL, SPEECH IN THE HOUSE OF COMMONS,
SEPTEMBER 8, 1942

After Stalin's death, Nikita Khrushchev recounted that in 1941, having found out about the German invasion, Stalin panicked, retreated to his dacha-fortress outside Moscow, completely kept out of all affairs, did not receive anybody, did not ask about developments on the front, and did not answer telephone calls. Stalin was totally apathetic. He isolated himself from all state and party obligations. Stalin was extremely depressed for over a week, and only on July 1 did the members of the Politburo manage to force him to return to the reins of power. This story was accepted and repeated in thousands of books and essays. It served as the main proof of Stalin's lack of readiness for war.

After 1991, the Soviet archives became more accessible, and researchers saw logbooks documenting visitors to Stalin's office from 1927 to 1953. It turned out that Stalin worked extremely hard in the first days of the war. The entry from June 21, 1941, read: "The last [visitors] left at 11 PM." This did not at all mean that Stalin's workday ended. After the last visitors left, he could have worked on the documents himself, talked on the telephone, worked outside of the office, in his Kremlin apartment or at his dacha. Stalin began receiving visitors on June 22, 1941, at 5:45 AM. He worked for eleven hours without breaks. His visitors included Molotov,

Beria, Timoshenko, Mekhlis, Zhukov, Malenkov, Mikoyan, Kaganovich, Voroshilov, Vyshinskyi, Kuznetsov, Dimitrov, Manuilsky, Shaposhnikov, Vatutin, Kulik, and others.

The following week was one continuous workday for Stalin, with only brief breaks. Reception of visitors began at 3:20 AM (June 23), or at 1 AM (June 25), and ended the following morning. The meetings lasted five, six, twelve hours. Sometimes Stalin's workday lasted twenty-four hours, with short breaks. After this initial week of the war, the logbooks have nothing recorded for two consecutive days, June 29 and 30.

Khrushchev claimed that when the Germans attacked, Stalin got scared and isolated himself. Today, we know that right after the German invasion Stalin worked seven days in a row, as much as humanly possible. During the first moments, Stalin simply did not believe that Hitler had invaded. Stalin had calculated all possible moves, and none of them included an attack by Hitler. During the first week of the war, Stalin herded his troops into an attack. He should have been giving orders for defense, but he resisted. Finally, on June 28, he found out that the Western Front was surrounded, the 4th Army was destroyed, and the 3rd, 10th, and 13th armies were encircled. Only then did Stalin finally understand that his plans for the "liberation" of Europe were over. When he arrived at the People's Commissariat of Defense on June 29, Stalin learned the true dimensions of the utter failure of the Western Front. There, Stalin exploded in anger at Timoshenko and Zhukov, bringing the latter to tears. Anastas Mikoyan recollected: "Stalin was despondent. After leaving the Commissariat, he said: 'Lenin left us a grand legacy, and we, his followers, flushed that legacy down the toilet.' We were shocked by that statement. Was everything lost for good? In the end, we ascribed those words to Stalin's emotionally affected state."¹

Stalin realized that he could not fix anything. The socialist country was capable of crushing others, but it couldn't compete with other countries in peacetime. From June 22, 1941, the Soviet Union was destined for demise. Sooner or later, it was bound to collapse. It could survive only by consuming everything around it. Otherwise, it was doomed. The Soviet Union could exist only if the Soviet people would have no opportunities to compare their lives with the lives of people in surrounding countries. Therefore, Stalin's main idea was to destroy the capitalism surrounding the Soviet Union. All of Stalin's plans were simple, logical, and understandable: complete victory was only possible on a global scale.

Hitler understood this as well: "The Bolshevized world will be able to hold only if it encompasses everything."² On June 22, 1941, Hitler delivered a suicidal but lethal attack on Communism. No matter how events unfolded afterward, Stalin could no longer conquer the whole world, which was the equivalent of his demise. On June 30, 1941, Molotov, Beria, Malenkov, and others entered Stalin's room in his dacha. Anastas Mikoyan, a member of Stalin's Politburo, left a wonderful description of this episode:

We came to Stalin's dacha. Found him in the small dining room, sitting in his armchair. Upon seeing us, he seemed to shrink into the armchair, then look at us questioningly. Then he asked: 'What did you come for?' He had a wary, strange look on his face—and the question he asked was no less strange. As a matter of fact, he should have summoned us all himself. I had no doubts: he had decided that we had arrived to arrest him. Molotov, speaking for us all, said that power had to be concentrated if the country were to get back on its feet, and that a State Committee of Defense had to be created. 'Who's in charge?'

asked Stalin. When Molotov answered that he, Stalin, was in power, the latter looked at Molotov with surprise, but said nothing. 'Fine,' he eventually pronounced.³

The members of the Politburo hadn't come to arrest Stalin. They needed Stalin as a symbol, a flag around which the remnants of a crushed division would rally in battle. They talked of saving the country, but Stalin did not listen to them. Without taking Europe, without expanding the Soviet Union's borders, the USSR would sooner or later crumble. Stalin had lost the country founded by Lenin. In 1941, only Stalin could appreciate the full weight of the German invasion. In 1941, the members of the Politburo could not fully understand that Hitler's invasion meant death for the Soviet Union. The Politburo forced Stalin to resume power, and Stalin, with a careless wave of the hand, returned, fully aware that the cause he had worked for his whole life was dead.

If It Weren't for Winter!

Future historians will come to the conclusion that, if one considers the military situation, the invasion of Russia was a political mistake and all military efforts were doomed from the start.

—COLONEL GENERAL HERMANN HOTH, *PANZER OPERATIONS*

During the war with the Soviet Union, Goebbels's "Reich Ministry for People's Enlightenment and Propaganda" quickly filled newspaper and magazine pages with thousands of photographs: German automobiles stuck in Russian mud, a horse being flogged because it couldn't pull a cart out of the terrible slush, blizzards covering tanks with a thick layer of snow, and gusts of wind ripping the summer hat off a poor German soldier's head.

The core principle of propaganda is visual appeal. Goebbels showed the shocked Germans back home tons of chronicles: mud, mud, mud, impassable mud, endless fields, plains, snow, and hurricane-strength wind knocking the soldiers off their feet. (The photos were taken on an airfield, where a three-engine J-52's propellers helped the storm, adding wind—and drama—to the situation.) If it were not for winter . . . from German staffs and memoirs of generals were added to Goebbels's propaganda, and featured descriptions of the horrors of the Russian winter, the impassable mud, and the unimaginable lack of roads.

It would seem that Marxist historians should have refuted these claims, so that nobody repeated the conclusions of Hitler's defenders. However, Marxist historians not only did not refute those claims, but they joined the chorus of Nazi voices. Marxist propagandists declared that the Russians were completely unprepared for war, and it wasn't them that defeated Hitler: all the credit should go to the endless Russian plains, the mud, and the fierce winter.

Why did the Communists need to repeat the Nazi lies? The answer was simple: they needed to prove that the Soviet Union could not have invaded Europe. They had to demonstrate weakness. Here is an example: "Artillery, motorcycles, trucks, and even tanks got stuck in the impenetrable mud; airplane wheels got stuck in the ground on air bases. The supply

of ammunition, fuel, and produce to the front was drastically reduced. [An] early winter suddenly replaced an unusually rainy autumn. When the ground froze in November, many cannon and vehicles were left right there on the spot, where they had gotten stuck in the mud several weeks earlier.”¹

The combined power of Nazi and Communist propaganda turned out to be so strong that the Hitler legend about the frost and winter, the lack of roads, and the vast open spaces was repeated by people who were wise and far removed from Goebbels’s propaganda. It is no surprise that to the question about the reasons for Hitler’s defeat, today’s German schoolchildren answer in unison: winter, frost, and open spaces.

I will pretend to agree that if it weren’t for winter, frost, and vast open spaces, Hitler would have crushed the Red Army and taken the Soviet Union. But if Britain was not an island, and protected by the English Channel from Hitler’s tanks, Hitler would have strangled England as well. And if the African desert wasn’t hot and full of sand, if there was a tunnel under the Mediterranean Sea to supply German troops with fuel and ammunition, Hitler would have kicked the British out of Libya and Egypt, and taken Africa. And if America was not across the ocean but in Europe, right under Hitler’s nose, and if America was a small country, the size of Belgium, Hitler could have crushed America, too. And if the Antarctic had a climate like France, Hitler could have turned it into resorts for his generals, with palm trees and beaches.

When we are told of tanks getting stuck in the mud, we should remember their specific power and their specific pressure on the ground. The best German tank of 1941, the T-III A, had a specific pressure of 0.94 kilograms per square centimeter of support surface. Of course it sank in the mud! Its specific power was only 13.9 horsepower per ton of weight. The rest of the German models were even weaker. These tanks were designed by people who simply did not understand the nature of war. These tanks could not compete with the Soviet tanks, and yet we are told that the mud was to blame.

In February 1940, the Red Army broke through the impenetrable Mannerheim Line. At the same time, the German army was simply refusing to fight in France. German generals, by blaming the weather in France, sabotaged orders to invade issued by the High Command. “Here, luckily, nature intervened and forced the postponement of the set date, which between the fall of 1939 and the end of January 1940 changed fifteen times.”² The order to start the invasion was postponed many times even after January 1940. German generals were unprepared to fight in France even in April.

In 1941, Hitler fought near Moscow. Here there was no Arctic frost like in Finland, no deep snow, no swamps. The topography around Moscow was an invader’s dream: there were no rocky rivers and no steep shores. Soviet defenses near Moscow did not compare to the Mannerheim Line. But Hitler got stuck. We are told: the Red Army could not fight, and that is why breaking through the Mannerheim Line took so much time. Nobody remembers the frost, snow, and impassable terrain in Finland. But the German army got stuck at Moscow’s gate only because the winter had prevented it.

On August 10, 1941, Colonel General Halder wrote in his journal: “The exhausted German infantry will be unable to oppose with decisive attack measures the enemy’s efforts. . . . At the current moment, our troops are heavily exhausted and experience heavy losses.”³ On the following day, Halder wrote: “The troops are exhausted. What we are now undertaking is the last and questionable attempt to avert a transition to a war of attrition.

The command has only very limited resources. . . . We have thrown our last forces into battle.”⁴ The blitzkrieg was already choking in August. The Germans were running out of strength, and the advance stopped. Hitler’s army was so weak and unprepared for war that two months after the start of the war offense was out of the question. On August 22, 1941, Halder wrote: “The Fuehrer’s note is full of contradictions. . . . The OKH’s position became insufferable due to the Fuehrer’s meddling and attacks. No one else but himself can bear the responsibility for the contradictory orders. . . . In the afternoon, our arguments and discussions were interrupted by a telephone conversation with Field Marshal von Bock, who once again stressed that his troops will be unable to defend themselves for long in the positions they took when they counted that an offensive on Moscow was coming.”⁵ September 5, 1941: “Our units surrendered to the enemy [at] the bend of the frontline near Elnya.”⁶ In the most strategically significant region of the theater of operations, the Army Group Center was unable to resist the pressure of the Soviet 24th Army and surrendered the staging ground they needed for an attack on Moscow.

Marshal K. K. Rokossovskii remembered: “Upon a realistic evaluation of the situation and a consideration of the coming winter, the enemy was only left with one choice—immediate retreat covering great distance.”⁷

Why didn’t the Germans retreat? On September 13, 1941, Halder wrote: “At the current moment, we cannot forecast the number of troops that can be freed from the Eastern Front upon arrival of winter, and the number of troops that will be needed for conducting operations in the following year.”⁸ This entry shows that the blitzkrieg was already over before the snow, before the mud. The war had already turned into a war of attrition—a prolonged war lethal for Germany.

On May 29, 1942, Hitler watched the famous Soviet film *German Defeat near Moscow*. In Henry Piker’s *Hitler’s Table Conversations*, Hitler’s comments are recorded in the entry for that day: “This winter we experienced especially harsh trials, because our soldiers’ clothing [and] the level of their motorization and supply did not in any way correspond to the conditions of that winter, when the temperature dropped below 50 [degrees] Celsius.”⁹ “Then the first German prisoners come, who form hordes without coats, gloves, without winter clothing. They dance from the cold, their hands thrust deep into their pockets, which they take out from time to time to rub their ears and noses! . . . Finally, the frozen German tanks, trucks, and cannon stretch in an endless file; all are abandoned, because the General Staff of land forces did not prepare in time sufficient amounts of frost-resistant fuel and winter clothing.”¹⁰

The following year brought Stalingrad. Moscow in 1941 didn’t teach Hitler anything. In Stalingrad, German troops once again were left without warm underwear. The main question is: what conclusions did Hitler and his generals draw from their catastrophic performance in the Russian winter? In 1941, they took no measures to supply their military operations during the winter. What was done to prepare for the following winter? On April 5, 1942, Hitler said: “In the central zone, we must immediately plant all the marshlands and swamps with cane, so that with the coming of the next winter we can stand the horrible Russian frost.”¹¹

A Model War

The victory of socialism in one country does not at one stroke eliminate all wars in general. On the contrary, it presupposes wars.

—VLADIMIR I. LENIN, *THE MILITARY PROGRAM OF
THE PROLETARIAN REVOLUTION*

A Soviet historian's account of Japanese-German relations in World War II went as follows: "The German leaders had especially strong expectations from their Japanese allies. They really wanted Japan to be the first to start military action against the USSR. . . . But the Japanese leaders evaded talks with Germany. Only in March 1941 did the Japanese minister of foreign affairs, Iosuke Matsuoka, arrive in Berlin. . . . Matsuoka refused to determine the deadline for Japanese action against the USSR, which led to a strong clash between him and Hitler."¹

The shortest route between Berlin and Tokyo lay straight through Moscow, and on his return trip from Berlin, the Japanese minister of foreign affairs, Matsuoka, stopped briefly in Moscow. Here, on April 13, 1941, he signed a pact of neutrality between the Soviet Union and Japan. Both countries pledged to "maintain peaceful and friendly relations and mutually respect each other's territorial integrity and independence. . . . In the event that one of the sides becomes the victim of military actions from one or several other nations, the other side of the pact will observe neutrality for the duration of the entire conflict."²

The neutrality pact between the USSR and Japan was a remarkable achievement for Stalin's diplomats and a crushing blow to Hitler's plans. Japan was Germany's ally, but it refused to fight against the Soviet Union. Moreover, Japan signed a pact with the Soviet Union instead. "When Matsuoka informed Ribbentrop about the high probability of a Soviet-Japanese pact, the head of German diplomacy stated that one would be wise not to involve oneself too intimately with the Soviet Union, but watch the events in the region."³ The Japanese government, however, had its own opinion on the matter. On April 14, the day after the signing of the Soviet-Japanese pact, Goebbels wrote in his diary that the agreement caused

a great sensation. For Germany, this was quite an unpleasant sensation.⁴ “The signing of the Soviet-Japanese neutrality agreement was a great surprise for Germany. Ribbentrop ordered the German ambassador in Tokyo to demand an explanation from the Japanese government.”⁵ An explanation was provided. Matsuoka told the German ambassador in Tokyo that “if Germany and the Soviet Union were to start fighting, not a single Japanese premier or minister of foreign affairs could keep the nation neutral. Japan will ally with Germany in attacking Russia, whatever the situation. Pacts of neutrality do not matter in this affair.”⁶ But this intent never materialized. Japan didn’t attack the Soviet Union.

On April 13, 1941, right after the signing of the agreement between Japan and the USSR, Matsuoka headed for the train station in Moscow, on his way to Tokyo. According to protocol, many officials accompanied him. Suddenly, the rules of protocol were broken. At the last minute before the train left, Stalin appeared on the platform. He usually never met anyone or saw anyone off. On that day, Stalin was in a remarkably good mood. Obviously, the train departure was delayed. Stalin laughed and joked. He walked with the Japanese minister right to the steps of the railcar, and here he did something entirely uncharacteristic for him—he embraced the Japanese minister and proclaimed that the Soviet Union and Japan would remain friends forever. Among those seeing off the Japanese minister was the German military attaché—Stalin noticed and also embraced him, declaring that Germany and the Soviet Union would also remain friends. Stalin’s behavior was very uncommon. He was usually very discreet. He never embraced anyone in the presence of outsiders. Many historians explained this unusual behavior as Stalin’s commitment to peace, as proof that he attempted to avoid war with Japan and Germany at any cost.

Exactly ten weeks later, on June 22, 1941, Germany invaded the Soviet Union. Soon, Stalin found himself on the brink of defeat. At this critical moment, the Japanese government kept its word to the Soviets and remained neutral. In that same year, 1941, Japan attacked the U.S. Navy at Pearl Harbor, triggering the war between the United States and Japan. This was advantageous for Stalin, and despite the signed pact, he started secret preparations to attack Japan. “They did not know Stalin well in Tokyo,” wrote one observer. “If the Japanese had at least superficially acquainted themselves with the lifestyle and career path of the great follower of Lenin’s legacy, they would have noticed that his methods always remained the same: make an alliance with somebody against somebody else, and follow it with a stab in the back to the ally once he becomes useless.”⁷

Stalin kept his intentions secret until the right time, but in the beginning of 1943 he told the American president about his decision to attack Japan. Stalin had planned his sudden attack on Japan not for 1943, when America was engaged in a difficult war and needed help, but at the very last moments of the war, when Japan would be already on the verge of defeat. Stalin could have helped the United States much earlier. He had the capacity to drastically quicken Japan’s defeat. The United States had a very powerful strategic air force, but they had to fly to Japan across the largest ocean in the world, and then fly back without refueling. Raids on Japan could also be carried out from islands in the Pacific Ocean, but these islands had to be taken first, and therefore it was first necessary to achieve naval domination. And even after taking the islands, the Americans still had to fly several thousand kilometers to their targets and back. Each plane had to carry a large amount of fuel and an insignificant number of bombs. The Soviet Union, on the other hand, was right next to Japan.

“Cordell Hill, the American Secretary of State, tried to obtain from Moscow permission for the American air force to use Soviet military airbases in the Far East.”⁸ Stalin firmly refused. President Roosevelt sent messages to Stalin on December 30, 1942, and January 8, 1943, urging the Russian leader to allow American air force units to be stationed on bases in the Soviet Far East. Stalin answered the messages with an uncompromising “no.”⁹

If Stalin had given the Americans the opportunity to use Soviet air bases, instead of making long flights to Japan from the faraway islands, every plane could have completed several short flights with a large load of bombs. In that case, the American raids on Japanese targets would have been considerably more effective. But it was in Stalin’s interest that the war between Japan and the United States be stretched as long as possible.

By the way, Stalin allowed America to use several Soviet air bases in the Poltava region for bombing Germany. American B-17 strategic bombers took off from the airfields at Poltava and flew to bomb Germany. Their takeoffs were covered by Soviet fighters, which accompanied them to the length of their radius of action. At the same time, other waves of American bombers flew out of Britain. Having dropped bombs on German cities and factories, these bombers landed on the airfields at Poltava. They were met by Soviet fighters, which covered them during landing. But Stalin did not give permission to use the air bases in Nakhodka and Petropavlovsk for bombing Japan. Stalin waited for a complete depletion of Japanese forces in a prolonged war, and prepared his own attack. As Japan weakened, Stalin strengthened the preparation for a war against it. Stalin called Japan an aggressor for the first time on November 6, 1944.¹⁰ On April 5, 1945, the USSR leadership cancelled the Soviet-Japanese neutrality pact.

In the summer of 1944, Stalin told Marshal A. M. Vasilevsky that he would be the chief commander of Soviet troops in a war against Japan.¹¹ The initial figures of the concentration of our troops in the Amur, Pacific Coast, and Trans-Baikal regions were sketched out in the fall of 1944. At the same time, rough calculations of the resources needed for a war in the Far East were made.¹²

Vasilevsky was one of the most talented commanders in the history of the Soviet Union. His talent became apparent during the war. In 1940, he was given the rank of major general. “[As] deputy chief of the Operations branch of the General Staff, he worked on the operational section of planning the strategic deployment of Soviet armed forces on the Northern, Northwestern, and Western Fronts.”¹³

A month after the beginning of the German invasion, Stalin appointed Vasilevsky as chief of the General Staff’s Operations Directorate. Vasilevsky was responsible now not just for a separate (although the most important) sector of the front, but for all the plans of the war on all fronts. Two months later, Stalin promoted Vasilevsky to lieutenant general. Half a year later, Vasilevsky became colonel general. One month later, Vasilevsky received yet another promotion: Stalin named him chief of the General Staff, the central brain of the Red Army, and entrusted to him the preparations for offensive operations in the Stalingrad region. In October 1942, Colonel General Vasilevsky became Stalin’s deputy. According to Vasilevsky’s plans, all command and communications posts in the Stalingrad region were moved to the very front lines. He also moved there all air bases, hospitals, huge supplies of shells, cartridges, fuel, and lubricants. Until the very last moment, Soviet troops did not know anything about what they were going to do. By keeping his offensive preparations secret from his own troops, Vasilevsky managed to keep them secret from the enemy as well. And then, a

sudden, crushing attack followed. All the so-called “mistakes of 1941,” Vasilevsky repeated at Stalingrad, because they were not mistakes at all, but a preparation for sudden attack.

Vasilevsky received the rank of General of the Army for the defeat of the surrounded German formations near Stalingrad. He only carried this title for twenty-nine days; after the Stalingrad operation, Stalin made him a Marshal of the Soviet Union. In the summer of 1944, during the peak of the war with Germany, Stalin not only gave Marshal Vasilevsky the task of planning a sudden attack on Japan, but appointed him to head all Soviet troops in a war against Japan. But Stalin had no intention of landing his troops on the Japanese islands. He had more attractive targets. Korea, Manchuria, the greater part of China, and French Indochina (Vietnam) were all occupied by Japan. Stalin planned to “liberate” them and take them under his control.

Starting in the summer of 1944, Soviet military might in the Far East began to grow, but it could not be observed from outside. There was rearmament and strengthening of divisions, corps, and armies, as well as a storing of the supplies necessary for a sudden and crushing attack. Roads, air bases, bridges, and command and communications posts were being built near the borders with great intensity. Soviet commanders, on orders from Moscow, moved ammunition and fuel storages and hospitals to the borders.

A movement of regiments, brigades, and divisions from the German front to the Far East began in the early spring of 1945. “The most important aspect of the preparations for the operation was the fact that they all had to be done before an official declaration of war on Japan.”¹⁴ Exceptional measures of concealment were taken. All sergeants and staff sergeants in the troops transferred to the Far East wore the insignia of privates. Junior officers had sergeant epaulets, and the senior officers wore the insignia of lieutenants and captains. Generals had fewer stars on their epaulets than they had earned. A major general could wear the epaulets of a lieutenant colonel or a major. Marshal Vasilevsky himself arrived in the Far East with the papers for a “Colonel General Vasilyev” and in the appropriate uniform.¹⁵

In May 1945, the troop transfer took on truly gigantic dimensions. “The mass regrouping of troops began with a transport by railroad from Eastern Prussia of the 5th Army, which had gained rich experience in breaking through fortified regions and operating in forested territories.”¹⁶ The 39th Army, also from Eastern Prussia, and the 53rd from Czechoslovakia were simultaneously moved. The 6th Tank Guards Army was to play the decisive role in the defeat of Japanese armies. It was moved from the Prague region. To conceal the movement of the tank army, the tankers not only changed their epaulets, but the insignia on them as well—they temporarily became medics, repairmen, and construction workers. Most importantly, the tanks and the rest of the heavy equipment of the 6th Tank Guards Army were left behind in Czechoslovakia. In Mongolia, near the state border where the tank army was to be relocated, new tanks had been arriving straight from factories in the Urals. They were prepared and carefully concealed well ahead of time.¹⁷ The same exact procedure was performed in the transfer of most artillery, air force, and other formations and regiments. For example, in June and July of 1945, 1,155 war planes of the newest models were sent straight from the factories to the air bases in the Far East.¹⁸ During this time, the pilots and engineer personnel of certain air force regiments, divisions, and corps were transported by railroad, without their equipment. New planes already awaited them in the Far East. On top of all this, the 6th and 7th Bomber Corps and two military-transport air force divisions were moved from air bases in Germany and Poland.¹⁹

The strategic regrouping of Soviet troops was carried out at a distance of nine thousand to twelve thousand kilometers. A regrouping of troops on such a scale was being performed for only the second time in human history. The first time was in May and June 1941, from the east toward the German borders. In 1945, it was done in the opposite direction. The commands of two fronts, three field armies and one tank army, fifteen rifle, artillery, mechanized, and tank corps—all those were moved to the Far East. The smaller units moved there together with their commands: thirty-six rifle, artillery, and air-defense artillery divisions, fifty-three brigades, and over a hundred separate regiments and battalions were moved there too.²⁰ In just three months, over 500,000 soldiers and officers were transported from Central Europe to the Far East. To minimize the volume of transports, a large part of the brigades, divisions, corps, and even an entire tank army were transported without their equipment. But some formations still had to be moved with their weapons and military equipment, and the number of arms transported with the troops was enormous: 3,340 tanks and self-propelled guns, 7,500 cannons and howitzers, 3,600 mortars, 1,100 rocket-launching field installations (“Katyusha”), and 1,400 warplanes.²¹ It took 135,756 railcars to transport this mass of troops and weapons.²²

During a surprise offensive operation, it would be necessary to supply a tremendous number of troops, which would be continuously moving forward. The troops immediately would need to receive hundreds of thousands of tons of ammunition, fuel, lubricants, food, and everything else that was indispensable for advancing. The transport of such quantities of cargo over distances of hundreds of kilometers could only be done by railroad. However, the Soviet Union’s railroads had a broad gauge, while Manchuria’s and China’s railroads had a narrow gauge. It was decided to re-weld the railroad gauge there to the Soviet standard. Special brigades of railroad troops with the necessary equipment were prepared for this.

The arriving cargo was unloaded directly onto the ground in each border station’s vicinity. Part of the cargo was not unloaded at all. It remained in the railcars, ready to follow the advancing troops across the border. “By the beginning of the operation, there were over 1,500 cisterns with fuel on the railroads of the Far East. . . . This imposed a great strain on the functioning of the railroads.”²³

After the strategic regrouping of the troops was complete, the three Soviet fronts contained eleven field armies, three air defense armies, three air force armies, one tank army, and four separate air force corps.²⁴ In addition, the Pacific fleet, the Amur flotilla, NKVD troops, and the armed forces of Mongolia were all under the command of the Soviet commander-in-chief in the Far East. The formation of Soviet troops included 1,747,465 men, 29,835 guns and mortars, 5,250 tanks, and 5,171 airplanes.²⁵ The Pacific fleet had 417 warships, including 78 submarines, and 1,618 airplanes, including 1,312 combat aircraft. The Amur navy flotilla had 126 warships and 68 combat aircraft.²⁶ Colonel Generals Vasiliev, Morozov, Maksimov, and Zolotov (in reality, Marshals of the Soviet Union A. M. Vasilevsky, R. Y. Malinovsky, K. A. Meretskov, and General of the Army M. V. Zakharov) arrived at the secret command posts ahead of the troops. To maintain secrecy, the “colonel generals” wore plain black jumpsuits over their uniforms, without any insignia, and during their trips to the vicinity of the state border they wore the uniforms of regular NKVD border troops.

A stream of cargo flowed in from the United States at the same time Soviet forces were being transferred out of Central and Eastern Europe. Stalin was the most cunning diplomat of the twentieth century. He demanded that the president of the United States supply food

and fuel for all Soviet troop formations. "An agreement was reached with the United States about the concentration of three months' supplies and fuels for our troops in this theater of military operations."²⁷ The United States also supplied airplanes, armored cars, automobiles, radios, telephone cables, medicines, optical devices, and much more.

Stalin gave instructions to the commander-in-chief in the Far East, Marshal Vasilevsky, and to the other front commanders back in Moscow. There were very few documents about the preparations for a surprise attack on Japan: one notebook with calculations and one map. These documents remained in the Kremlin. Marshals and generals had to remember their objectives without using any papers. Upon arrival in the Far East, the front commanders began detailed planning and calculations. "A strictly limited number of people were allowed to see the drafting of plans for the fronts. Only the commander, the member of the military council, the chief of staff, and the chief of the operations directorate of the front knew the plans in full."²⁸

The Trans-Baikal Front was deployed in a territory stretching 2,300 kilometers, and it was supposed to carry out a surprise attack eight hundred kilometers deep into enemy territory. There were 648,000 troops, 2,359 tanks and self-propelled guns, 1,324 warplanes, 9,668 guns and mortars, and 369 salvo-fire field installations ("Katyusha").²⁹ Four men, without secretaries, draftsmen, or other personnel, did all the planning of military operations for this mass of troops.

The 1st Far Eastern Front had 589,000 troops, 11,430 guns and mortars, 274 salvo-fire field installations, 1,974 tanks and self-propelled guns, and 1,137 combat planes. All the planning on this front was also done by just four men.³⁰

The Trans-Baikal and the 1st Far Eastern Fronts were to attack in converging directions. Between these two attack formations there was the relatively weaker 2nd Far Eastern Front, which had 333,000 troops, 5,988 guns and mortars, 72 salvo-fire field installations, 917 tanks and self-propelled guns, and 1,260 combat planes.³¹ A classic encirclement operation was being prepared, with a relatively weak middle and two extremely powerful flank formations. The newness lay in the size of the operation. All three fronts were meant to advance simultaneously along the front line of 5,130 kilometers. Such an operation was unprecedented. (Let's hope that it will never again be repeated.)

Stalin issued a special directive, which required the front commanders to define the objectives to the armies verbally, without producing any written documents.³² After receiving an objective, the army commanders were to commence the planning of the operation. General M. Gareev was at that time a major in the operational staff sector of the 5th Army of the 1st Far Eastern Front: "Near the station Muchnaya, we were shut in a separate, heavily guarded house, [from] which no one was allowed outside. Guards brought in food. We had to work almost around the clock. ³³ Exchanging letters with questions regarding the operation preparations was forbidden, even in code. The army commanders described the objectives to the division commanders verbally, using only a map. Radios only received signals. In the artillery units, communication by radio was permitted only after the beginning of artillery softening-up, and in the other units after the beginning of the attack."³⁴

The unloading of arriving troops and all troop movements took place during the night. The arriving troops were immediately sent to special areas, where hiding places had been prepared in advance. Before beginning the offensive, the main forces were to be kept back, and part of the artillery was to move closer to the border and be ready to open fire.³⁵ Special

squads of the fortified regions worked in the fields harvesting hay in all the areas visible to the enemy. The officers went to the local resorts and sanatoriums during their leave. The enemy was also confused by the fact that the local population from the border territories was not relocated, and their daily life was not affected by any changes. Training exercises were conducted at the same time as the troop movements, so the local population took everything they saw for regular military drills.³⁶

The core principle of strategy is the concentration of force against weakness. The most powerful Soviet formation, the Trans-Baikal Front, was deployed against the weakest area of the Japanese defenses. But even here the forces were not spread out evenly along the entire border. Instead, extremely powerful assault groups gathered. Between these groups remained significant gaps, which were not covered by any troops. For example, on the Trans-Baikal Front, there was a gap of two hundred kilometers between the 17th Army and the 6th Tank Guards Army.³⁷ Long before World War II, there was a chain of fortified regions erected along the border in the Far East. These regions housed a significant number of troops that were specially trained for conducting long defense operations. But in the summer of 1945, Japan found itself on the verge of defeat. Therefore, the Soviet troops stationed in the fortified regions were issued orders to leave their armored concrete fortifications and reinforce the assault formations.³⁸

On August 6, 1945, the American air force dropped an atomic bomb over Hiroshima, and on August 9, over Nagasaki. Japan was on its deathbed. And at this moment, on August 9, 1945, the Red Army carried out its sudden and crushing attack against Japanese troops in Manchuria and China. The operations of all the armies were planned according to the principle of surprise attack and overpowering the enemy with the immediate use of gigantic force. Even in secondary locations, the actions immediately took on an active and maneuvering character.³⁹ On August 8, the Soviet government declared: "This kind of action is the only measure capable of speeding up the coming of peace, to save people from further suffering and misery, and give the Japanese people the opportunity to rid themselves of danger and destruction."⁴⁰

In the evening of August 8, 1945, the Japanese ambassador in Moscow was notified of a Soviet statement, which read: "Starting the next day, August 9, the Soviet Union will consider itself in a state of war with Japan."⁴¹ On August 9, the Soviet armies carried out their surprise attack. One could ask: How was it possible to declare the war on August 8 and to deliver a sudden strike on August 9? The answer is that in Vladivostok the day begins seven hours earlier than in Moscow. Military actions began on August 9 at 12:10 AM Vladivostok time.⁴² At that moment in Moscow, it was still 5:10 PM on August 8. No one had yet warned the Japanese ambassador. Then, when night fell in Moscow, the Japanese ambassador was summoned to the People's Commissariat of Foreign Affairs and at 11:50 PM Moscow time, it was announced that a war would begin on the following day. In Moscow, there were still 10 minutes left until the next day, but in the Far East the new day had long since begun. At the time of the announcement, it was already 6:50 AM. War had been going on for over six hours. The most important events had already happened: a sudden Soviet air raid destroyed the Japanese air bases, the border defenses were liquidated, and powerful tank formations entered Manchuria and China, continuing an unstoppable thrust forward.

The Japanese ambassador in Moscow was told about the beginning of the war, but he still had to reach the embassy and communicate with his government. All the telephone

and telegraph lines were not working. Even in normal circumstances, radio connection with Japan, which was almost halfway around the world, was difficult. But here the circumstances were not normal: someone had tampered with the radio stations. In other words, the Japanese government found out that war was declared after a huge delay and through entirely different channels. In military language, this could be called “preparation and carrying out of a sudden initial attack with the opening of a new strategic front.”⁴³ In the language of politics, this was called a “just and humane action by the USSR.”⁴⁴

After the first crushing attack, Marshal R. Y. Malinovsky told his troops on August 10, 1945: “The Soviet people cannot live and work in peace while the Japanese imperialists brandish arms at our far-eastern borders and await a convenient moment to attack our motherland.”⁴⁵ Malinovsky spoke four days after an atomic bomb had been dropped on Hiroshima and one day after an atomic bomb had been dropped on Nagasaki. Those two Japanese cities lay in ruins unseen in human history, and Malinovsky was fully aware of the fact. Did the “Japanese imperialists,” after Hiroshima and Nagasaki, really have nothing else to do but “await a convenient moment”?

In March 1939, Stalin had accused Great Britain and France of wanting to draw Europe into war while they remained on the sidelines: “In the politics of non-intervention, there is a desire not to hinder the aggressors while they do their dirty deeds, not to interfere, for example, with Japan involving itself in a war against China . . . the goal is to let all the participants of the conflict become engulfed by the quicksand of war, and let them weaken and exhaust each other. Then, when they are sufficiently weakened, one can enter the scene with fresh forces, act, of course, ‘in the interests of peace,’ and dictate to the weakened war participants all the terms of peace.”⁴⁶ Stalin always ascribed his own intentions to his enemies. Stalin did everything that he accused Great Britain and France of doing. Now, Japan was exhausted by the war, and it was time to intervene “in the interests of peace”: “The Soviet government, striving for the quickest possible restoration of peace, issued a declaration of war.”⁴⁷

The offensive operation by Soviet armies in August 1945 was truly a lightning war. “The forward battalions, accompanied by border guards, silently crossed the border without opening fire, and before the Japanese defenders had time to occupy them, took control of long-term enemy defense structures in a series of locations.”⁴⁸ In just the first day, the 6th Tank Guards Army completed a thrust of 150 kilometers. The advance took place in extremely difficult conditions. Manchurian summers were extremely rainy, especially in August. Rivers overflowed, and fields and roads turned into impassable swamps. The troops of the 1st and 2nd Far Eastern Fronts had to cross the Amur River, one of the largest rivers on the planet. It stretched 2,850 kilometers in length. In August 1945, the Amur’s water levels were four meters higher than usual and flooded thousands of square kilometers. The rivers that flowed into the Amur, among them the Ussuri and the Sungari, also overflowed.

The Trans-Baikal Front faced an entirely different situation—the tank columns advanced through waterless steppes in thick clouds of dust. The temperature was 30 degrees Celsius, sometimes even higher. Ahead, the troops had to overcome the Great Khingan Range, behind which unfolded a territory of rice fields completely unfamiliar to the Soviet soldiers.

It is claimed that the Japanese troops put up weak or no resistance. That is not true. The Japanese soldiers were the most tenacious in the world. They did not yet know about the destruction of Hiroshima and Nagasaki; the Japanese government was in no hurry to tell the

troops about the catastrophe. The Japanese resistance stopped only after the troops received orders to capitulate. Before these orders came in, the Japanese fought to the death. But their tenacity was met with maneuvers. The territories fought over were huge, and Soviet troops simply bypassed the points of resistance, without engaging in prolonged combat.

Soviet troops did the impossible. The 6th Tank Guards Army overcame the Great Khingan Range, reached the open areas, and completed an incredible advance toward the Yellow Sea. In eleven days, with battles, its troops covered 810 kilometers. Assault units and paratroops operated ahead of them, taking air bases, bridges, and ferries. Here is a list of just some of the cities around which paratroops were landed successfully: Kharbin, Chongjin, Port-Artur, Mukden, Pyongyang, and Khynnam. The masters of blitzkrieg, German generals, gave high marks to the actions of the 6th Tank Guards Army and other Soviet troops. Major General F. W. von Mellentin recounted: "To illustrate the growing flexibility of the Red Army's military actions and its capacity to successfully conduct broad and decisive tank operations, I want to point to Marshal Malinovsky's sensational advance into Manchuria in August 1945."⁴⁹

Von Mellentin continued to say:

Other Soviet troops acted just as decisively and successfully. The Soviet navy sank Japanese ships, and landed naval assault forces on Sakhalin, in North Korea, and on the Kuril Islands. After entering the Sungari River, the Amur flotilla supported the advance of the 15th Army right up to the Kharbin Ranges. It constantly received rifle companies on board, and functioned as a sort of vanguard for the main forces of the 15th Army. In ten days of advance, the main forces of the flotilla, together with the troops of the 15th Army, which in part were stationed on the ships and in part advanced along the shorelines of the Sungari, covered over nine hundred kilometers along the Amur and Sungari rivers.⁵⁰

Supplying one and a half million advancing troops was quite a formidable task. "The restoring of railroads, with the changing of the gauge to the Soviet standard, was done on the 1st Far Eastern Front at an average rate of seventy-one kilometers per day. This was achieved through the innovativeness of the railroad workers. They were included in the air assault troops and frontline units, so they were able to take over railroad connections and immediately organize the local population to repair the tracks and change the gauges."⁵¹

Officially, the Soviet military campaign in the Far East lasted twenty-four days, but battles only took place for twelve days. Not even two weeks had passed before a massive surrender of the Japanese troops began. Japanese losses numbered 84,000 killed and 594,000 taken prisoner. Among the prisoners were 148 Japanese generals. Unbelievable trophies were captured.

The results of the operation were enviable. The United States had fought against Japan for almost four years, and what did it receive? The Soviet Union fought against Japan for twelve days, and all of China, North Korea, and North Vietnam fell under the Soviet Union's control. Vasilevsky happily reported:

By delivering a crushing blow to the Japanese troops in Korea, the Soviet Army created favorable conditions for the activities of revolutionaries. . . . In the northern section of the country, workers led by Communists began to build the first truly independent, demo-

cratic nation in Korean history. . . . As a result of Japan's defeat, favorable conditions were created in China, North Korea, and North Vietnam for the victory of people's revolutions. . . . The Chinese People's Army of Liberation received huge reserves of trophy arms, military equipment, and supplies. . . . The defeat of Japanese militarism opened the way for national liberation movements throughout Asia. On September 2, when the Japanese foreign affairs minister Sigemitsu and Chief of Staff Umedzu signed the pact of total capitulation, President Ho Chi Minh declared the birth of the Democratic Republic of Vietnam. On October 12, the Laos patriots pronounced the birth of Phatet-Lao.⁵²

For many years, Soviet officers have been taught the lightning war of 1945 as an example. That was how one must fight: in two weeks, hundreds of millions of people were under Soviet control. One should be amazed by the assault of the 6th Tank Guards Army, the thrust of the Amur flotilla up the Sungari River, the bold actions of the paratroops. The most amazing was the coordination among the troops. Tankers, pilots, artillerymen, sailors, communications men, paratroops, railroad workers, sappers, and the High Command staff in the Far East, the administrations and staffs of the three fronts and one fleet, eighteen armies and one flotilla, tens of corps, divisions, and brigades, hundreds of regiments and thousands of battalions, performed like one symphony orchestra under the direction of the great maestro Vasilevsky.

I reread many times Marshal Vasilevsky's biography, his book, and his articles, before I stumbled across a sentence that made me pause for breath: "Since May 1940, the deputy head of the Operations Directorate of the General Staff worked on the operational part of a plan of strategic deployment of Soviet armed forces in the northern, northwestern, and western directions."⁵³ In other words, between May 1940 and June 1941—that is, for more than a year—Major General Vasilevsky worked on preparing a plan for war against Germany. He personally prepared war plans for the Northern, Northwestern, and Western Fronts—in other words, for the Soviet troops in the Karelian, Baltic, and Byelorussian regions. These regions were precisely where the Soviet troops were hit the hardest in the summer of 1941. The troops of the Northern Front let the Finnish troops from the north through to Leningrad, and the worst blockade in human history ensued. The formations of the Northwestern Front fell apart, letting German troops through to Leningrad from the south. The troops of the Western Front in Byelorussia were almost instantly surrounded and crushed, leaving the way to Moscow wide open.

Stalin didn't criticize or punish Vasilevsky for such planning. On the contrary, a month after an unprecedented catastrophe for the Red Army, Stalin appointed Vasilevsky to the position of head of the Operations Directorate of the General Staff, entrusting him with drafting all plans on all fronts and in all directions. Vasilevsky walked the path from Major General to Marshal of the Soviet Union faster than anyone else—in just one and a half years. Stalin entrusted him personally with planning the defeat of German troops near Stalingrad, the victory at Kursk, the brilliant operation in Byelorussia, and then the war against Japan.

The selection of other high commanders for the task of the lightning defeat of Japanese troops in 1945 was also surprising. In June 1941, Lieutenant Colonel S. P. Ivanov was the chief of the operations division of the 13th Army headquarters on the Western Front. The significant part of the 13th Army was surrounded and perished on the sixth week of the war with Germany. Ivanov miraculously stayed alive and climbed the peaks of military power. He

was first appointed chief of staff of the 38th Army, then chief of staff of the 1st Tank Army, and then of the 1st Guards Army. He successfully fulfilled all these roles. He planned the army operations in the most strategically important locations. In 1942, he became chief of staff of the Southwestern Front, which included the Stalingrad region. Here once again he performed brilliantly. S. P. Ivanov directed a number of staffs on various fronts, and always in the most important locations of the war. In the summer of 1945, he was already a colonel general. Stalin appointed him to be chief of staff of the High Command of Soviet troops in the Far East. Marshal Vasilevsky was the high commander and S. P. Ivanov was the head of the brain center. The lightning-speed defeat of Japanese troops was not only Vasilevsky's accomplishment, but also Ivanov's. S. P. Ivanov was a brilliant staff officer. He never made any mistakes in planning. On the contrary, his plans were examples to be followed by staff officers for many generations. How could it be that in 1941 everything in his plans was completely incorrect?

Until February 1941, General K. A. Meretskov was the chief of general staff of the Red Army. He was personally responsible for all war plans. From February until June 1941, the plans could not have radically changed. Consequently, Meretskov carried the responsibility for the defeat of the Red Army by the Germans in June 1941. But in 1945 Meretskov carried the title of Marshal of the Soviet Union. Stalin entrusted him with the command of the 1st Far Eastern Front.

Lieutenant General M. A. Purkaev in 1941 was the chief of staff of the Kiev special military district, the most powerful of Soviet districts. The district was transformed into the Southwestern Front, which was surrounded and decimated east of Kiev. In 1945, Stalin entrusted General Purkaev with the command of the 2nd Far Eastern Front.

In 1941, Major General R. Ya. Malinovsky commanded the 48th Rifle Corps. The corps was stationed on the Romanian border where there were no German troops. It was preparing for invasion, but it had to retreat. In 1945, Malinovsky was a Marshal of the Soviet Union. Stalin trusted him with the most powerful Trans-Baikal Front and once again placed him where the enemy was most vulnerable.

Generally, Stalin entrusted all the men who had planned the war against Germany with planning and conducting the war against Japan.

I have been taught to search for rules in the actions of enemy troop leaders, to note all moments that repeat themselves. If a general has a propensity to use the same maneuver several times, his conduct in the future can be predicted and his plans can be resisted. I used this method to analyze the battle habits of Soviet generals. I discovered that they had constantly repeated the same preparations: before carrying out the surprise attack against the Japanese 6th Army at Khalkhin-Gol in 1939; before invading Finland in 1939; before the operation to take Bessarabia in 1940; before sending Soviet troops into Iran in August 1941. They did it in all the aggressive operations of World War II, and, finally, before the sudden defeat of Japanese troops in August 1945. In the summer of 1941, they followed the same program.

Understandably, Japanese intelligence was unable to determine the true scope of the Soviet troop transfer, the date of the beginning of the invasion, or the locations chosen for the primary attacks. But still, it saw something, and in the Japanese staffs it was understood that such a troop transfer meant that sooner or later the Red Army would attack. The Japanese had only one way out: to carry out a preemptive strike against the Soviet troops. If the Japanese

army had carried out an attack, the disaster of June 1941 would have been repeated in the Far East at the end of July or the beginning of August 1945.

Thousands of Soviet tanks without crews, as well as thousands of airplanes without pilots in the fields, were left right on the borders. The border forests were full of piles of shells, the railroad stations with trains of fuel and ammunition. If the Japanese had attacked, they would have seized all these resources, while the Red Army would have been left without ammunition or fuel. Thousands of soldiers from the railroad troops were ready to change the Japanese tracks to the Soviet standards, but they were not prepared to blow up their own bridges and tunnels. If they had attacked, the Japanese armies could have used Soviet bridges and tunnels. Soviet artillery had advanced right up to the border, but was not protected by infantry. For the purpose of surprise, the tanks and infantry would advance to the border only at the very last moment. If they had attacked, the Japanese could have taken thousands of Soviet cannon and howitzers, millions of shells which were already piled on the ground, and the Red Army would have been left without artillery, just like in 1941. The Red Army's command posts and communication lines were also located right at the borders. In the event of a surprise Japanese attack, the Red Army would have been left without command or communication—in other words, without a head or a nervous system.

On Stalin's orders, the command and staff of the Karelian Front, with Marshal Meretskov in command, was transferred to the Far East. The choice fell on them because the Karelian Front had tremendous experience in breaking through long-term fortified regions. This was exactly the work they were to do in Manchuria. The 5th Army, transferred from Eastern Prussia, was chosen for the same reason. This army also had rich experience in breaking through fortifications. At the same time, Soviet troops designated for the defense of fortified regions left their concrete fortifications and prepared to cross the border. The situation was extremely favorable for a Japanese invasion: the Red Army was preparing for attack, but it was not preparing for defense. It left all its fortified regions without troops. Hundreds of thousands of Red Army soldiers and officers were in trains, not knowing where they were being taken and what they were supposed to do.

Arriving Soviet troops were formed into tight assault formations, which made great targets for the Japanese air force. The bare areas between the attack formations were two hundred kilometers or more. The Japanese would not even have to breach Soviet defenses in these locations, because there were none there. Most importantly, the Soviet troops had no plans for defense in the Far East in the summer of 1945. Invasion plans were relayed to the troops at the very last moment. If the Japanese troops had carried out a surprise attack before August 9, 1945, Soviet troops would have suffered almost the same losses as Soviet troops in the summer of 1941 on the German border. And we would now be laughing at the stupidity of Soviet marshals, who ordered soldiers to harvest the hay in the fortified regions and sent officers to rest homes and sanatoriums. But the Japanese did not attack, since they never planned to attack the USSR, at least not in 1945.

Conclusion

The Aggressor

We will bury you!

—NIKITA KHRUSHCHEV, AT A RECEPTION FOR FOREIGN AMBASSADORS
AND JOURNALISTS IN THE KREMLIN, NOVEMBER 1956

The Soviet Union entered World War II as an aggressor. Poland, Finland, Estonia, Lithuania, Latvia, Romania—all the western neighbors of the Soviet Union—fell victim to the Red Army. During talks in Berlin, Stalin's envoy Molotov demanded strongholds in Yugoslavia, in the Adriatic Sea, in Greece, in the Bosphorus and Dardanelles, in the Persian Gulf; he demanded that countries south of the Baku-Batumi line, in the direction of the Persian Gulf, be given over to Soviet control, including eastern Turkey, northern Iran, and Iraq. He also declared the Soviet Union's interest in southern Bukovina.¹ Molotov constantly asked Hitler and Ribbentrop whether Germany had reconsidered its position on the fate of Finland, seeing that the Soviet Union was not going to let that country be independent. Finally, Stalin's major demand at the Berlin talks in November 1940 was for Germany to acquiesce to a Soviet military presence in Bulgaria. Molotov added, in a conversation with Hitler, that "the USSR was ready to support Bulgaria in its desire for an outlet to the Aegean Sea, and considered said desire to be just."² Stalin never specified which countries his puppet Bulgaria would have to invade to reach this outlet—Greece, Turkey, or both. In reality, the Germans took Greece and gave the go-ahead for Bulgaria to annex a part of the Greek territory—western Thrace and eastern Macedonia, thus reaching the Aegean Sea. But it was Stalin who wanted to give this go-ahead.

The Soviet Union finished World War II as an aggressor as well. It was the only country that expanded its borders as a result of World War II. Stalin annexed Estonia, Latvia, Lithuania, northern Bukovina, western Ukraine, and western Byelorussia, as well as parts of eastern Prussia with Königsberg, Trans-Carpathian Ukraine, the Kuril Islands, South Sakhalin, and Bessarabia.³ Under the banner of the "great patriotic war," Stalin punished entire peoples and nations. On Stalin's orders, all the Chechens, Ingushes, Crimean Tatars, Volga Germans, and

other peoples were transported to empty frozen fields or waterless, lifeless steppes, and abandoned there to die. It is interesting to note that the Kalmyks, who already lived on the steppes, were not relocated further into their depths but into the Siberian taiga. Stalin controlled the fates of entire peoples, not only on the territory of the Soviet Union but also in nearby countries. Stalin relocated millions of Germans from Prussia, Silesia, and Sudet.

When the Nazi leaders went on trial in Nuremberg, Hitler's concentration camps in Buchenwald, Sachsenhausen, Mulberg, Furstenwalde, Liebe-Roze, Bautzen, and others were not shut down. These concentration camps were simply taken out of the SS system and incorporated into the system of the GULAG. Thus, for example, the Nazi concentration camp at Buchenwald was transformed into "Special camp #2," which remained operational until 1950. Of the 28,000 people imprisoned there in those five years, seven thousand (25 percent) died. In comparison, from 1937 to 1945, 250,000 people went through the Nazi Buchenwald. Of that number, 50,000 (20 percent) died. The Communist Buchenwald had a higher death rate.

The Red Army came to Central Europe with the supposedly noble goal of liberating it from the Nazis, but it left only after establishing puppet governments in most of those countries. Poland, Czechoslovakia, East Germany, Hungary, Romania, Bulgaria, Yugoslavia, part of Austria, and Albania were forced under Stalin's control, as well as China, North Korea, and Vietnam in Asia. On July 22, 1945, the Soviet delegation suggested that the Soviet Union, the United States, and Great Britain separately or jointly oversee the former Italian colonies in Africa and the Mediterranean.⁴ On July 23, Stalin demanded the right to create Soviet military naval bases in the Black Sea region, in the straits of Bosphorus and Dardanelles.⁵ He also wanted parts of Turkey—the Kars and Ardagan regions—to belong to the Soviet Union.⁶ Stalin tried to take control of West Berlin by strangling it through a blockade. Soviet agents appeared in France, Italy, and Greece. The NATO military alliance was formed with the clear goal of preventing Stalin's troops from occupying Greece and Turkey. Stalin declared northern Iran to be a part of Azerbaijan, and right until the end of his life never gave up trying to take control of this province. Stalin set up the People's Democratic Republic of Southern Azerbaijan, and the Kurdish People's Democratic Republic, respectively in northern and western Iran.

In 1945, tens of millions of square kilometers of territory, occupied by millions of people, lay at Stalin's feet. But Stalin at that time did not have the resources to control all his conquests. On June 22, 1941, Hitler dealt a lethal blow to the Soviet Union. The best part of the male population of the Soviet Union perished in the war against Germany. After the war, the USSR was supposed to have conducted a population census and calculated its war losses. But Stalin did not conduct a census. It was only conducted fourteen years after the war, when Stalin was dead. "The decision not to count all the citizens until 1959 was founded on a desire not to draw attention to the huge unjustified human losses during the war period."⁷

During the last year of the war, the Red Army had to recruit underage boys, without saying how many years they would have to serve. They were kept in the army for seven to eight years. Otherwise, there would have been nobody left to serve in the gigantic army, which controlled almost half the globe. Those seven to eight years lasted until Stalin's death. If he had lived longer, these soldiers would have been kept in the army for fifteen years, or even more.

World War II opened unlimited opportunities for Stalin to spread Communism throughout the world, but there was nobody left in the Soviet Union to reap the crops in the fields. Famine broke out in the country in 1946 and 1947. One soldier was quoted as saying: "In this awful regiment, we were awfully hungry. Our rations were very small, plus they somehow managed to rob us."⁸ The army, which the government was supposed to feed, starved. The people, whom the government was under no obligation to feed, starved as well. The famine of 1946 and 1947 claimed the lives of about a million people. Stalin had sentenced Europe to death, but he could not carry out the execution.

Hitler, according to Stalin's plans, was supposed to crush Europe, and then Stalin, with a surprise attack, would "liberate" it from Hitler. In the name of that goal, German tankers and pilots were trained in the Soviet Union, and Stalin brought Hitler to power. But Hitler ruined Stalin's plan.

Some people did not even notice that the Soviet Union lost World War II. Where was Stalin's great victorious country? The Soviet Union was created for war and conquest. It was not adapted for peacetime. It could either spread over the entire planet and kill off all normal life, or die. Stalin did not succeed in taking over the world, and this meant another war or the end of the Soviet Union in the near future. The Soviet Union was preparing itself for a new war, World War III. It concentrated all its strength and resources in preparing for a new war, and it was crushed in 1991 by the burden of its military expenditures.

Epilogue

Stalin Was a War Criminal

Stalin was a war criminal who should have been tried at Nuremberg in 1946 along with the German deputy Fuehrer, Rudolf Hess—so argued Hess’s defense lawyer, Dr. Alfred Seidl, who opened the defense for Hess on March 22, 1946. Through a secret protocol, Hitler and Stalin had conspired to divide up between them countries conquered by their armies. Hitler was dead, but Stalin, according to the mandate of the Allied Military Tribunal, should have been indicted. The charges against him should have been similar to those against Hess, said Hess’s lawyer.

Hess was charged with:

1. Conspiracy to wage aggressive war
2. Crimes against peace
3. War crimes
4. Crimes against humanity.

Since Hess had flown to England in May of 1941, and had been taken prisoner by the British a month before Hitler attacked the Soviet Union, Dr. Seidl was confident he could gain an acquittal on the charges of war crimes and crimes against humanity. Since Hess was in captivity in England he could have had no part in the atrocities against the Jews. The first two charges would be more difficult to refute since Hess, as Hitler’s deputy, had discussed with the Fuehrer the events that led to war, and until May 1941 Hess had agreed with all of Hitler’s decisions.

In *Hess: The Man and His Mission* (London: David Bruce and Watson, 1970), the Czech-born journalist, diplomat, and writer J. Bernard Hutton described how Dr. Seidl learned of the secret protocol to the Hitler-Stalin pact signed by Soviet foreign minister Vacheslav Molotov and German foreign minister Joachim von Ribbentrop, which implicated Stalin in war crimes. After a long and frustrating interview with Hess, who insisted he did not want to defend himself with a lawyer, Dr. Seidl was preparing to leave the prison. In the

prison yard he overheard *Reichsmarschall* Hermann Goering and Von Ribbentrop talking. Von Ribbentrop offered an astonishing piece of information to Goering. He said that when he visited Moscow in August 1939 to arrange the German-Soviet treaty with Molotov, he had also signed a secret treaty which was not made public. Von Ribbentrop told Goering: "This secret agreement defined spheres of interest in the event of any war."

The two foreign ministers had drawn a line upon a map along the Vistula and the Bug, the two rivers that divide Poland. They had agreed that, should war come, the territory to the west of the two rivers should become a German sphere of interest, and the territory to the east would be under Soviet control. The Soviet sphere included Finland, Estonia, Latvia, Lithuania, the eastern part of Poland, and certain areas of Romania. Von Ribbentrop also told Goering that the Russians had assured him, since his arrest, that it would be made easier for him if he did not talk about this secret agreement in court. Stalin clearly wanted to keep his secret pact with Hitler—to carve up and share Poland and the Baltic states—from being made public at a time when the Russians were part of an international military court passing sentence on war crimes that included conspiracy to wage aggressive war and crimes against peace.

Dr. Seidl realized at once the significance of this secret pact to his client. After the military action of Germany and the Soviet Union against Lithuania, Latvia, and Estonia in June 1940, both Germany and the Soviet Union had denied that any political agreement existed, apart from the German-Soviet treaty concerning boundaries, which was concluded on August 23, 1939. It followed that if Dr. Seidl could prove such a secret plan did exist then Stalin and the Soviet Union were as guilty of waging aggressive war as any of the Nazis in the dock. Dr. Seidl would be able to argue that his client should be found not guilty or else Stalin and other Kremlin men should join him in the dock, explained Hutton.

Dr. Seidl set out to find another witness to the secret protocol signing besides Von Ribbentrop. After a difficult search he managed to come across Dr. Friedrich Gaus, who had been undersecretary of state in the German foreign ministry and had accompanied Von Ribbentrop to Moscow for the treaty signing. "Was there such a secret agreement?" Dr. Seidl asked. "Yes," confirmed Dr. Gaus, "I remember it clearly." When asked where a copy could be found, Gaus said he had no idea since to his knowledge all the important files of the German foreign ministry had been microfilmed and surrendered to American officials.

Dr. Seidl needed documentary evidence to make his case. When his efforts to find the document by going through normal bureaucratic channels failed, he spread the word of his search to all the high-ranking American officers he met socially and told them about the specific document he was looking for.

One evening as he was leaving the court, an American officer, whom he did not know, approached him and asked in German, "Are you Dr. Alfred Seidl?" The lawyer nodded. As Hutton wrote, "The American introduced himself. He then handed Dr. Seidl a plain sealed envelope. 'This is something that may interest you,' he said. Dr. Seidl ripped open the envelope, his fingers trembling as he leafed through the contents. It was a copy of the agreement between Molotov and von Ribbentrop that he was searching for. The American officer discreetly disappeared."

After studying the document Dr. Seidl saw that it was not a photostatic copy and had no official seal. He gave the document to Dr. Gaus, who said it seemed to him to be a true

copy of the secret agreement reached between Molotov and von Ribbentrop. Dr. Gaus willingly signed an affidavit:

About noon on August 23, 1939, the plane in which I was traveling with von Ribbentrop landed in Moscow. I was acting as his legal advisor in regard to certain negotiations between [him] and Stalin. I was not present but there was a counselor from the embassy and Hilger, who acted as interpreter. Also present was Ambassador Count Schulenburg.

The outcome seemed to be satisfactory to Von Ribbentrop, who expressed the opinion that Germany would be successful in her proposals.

In the evening a second discussion took place for the purpose of completing and signing the necessary documents. I had prepared the draft for Herr von Ribbentrop. Ambassador Count Schulenburg and the counselor from the embassy and Hilger were also there. Stalin and Molotov carried on the negotiations for the Russian side assisted by Pavlov, who interpreted.

An agreement was reached regarding the non-aggression pact between Germany and Soviet Russia, but a phrase regarding the friendly shaping of German-Russian relations was objected to by Stalin, who said that the Soviet government could not suddenly publicize a German-Russian friendship after the National Socialist foreign minister had poured "buckets of putrid ditch water" over them for six years. It was necessary for it to be reworded.

Beside the non-aggression pact there were negotiations at some length about a special secret document which in my recollection was called "secret protocol" or "secret additional protocol." This [was] aimed at the delimitation of the mutual spheres of influence in the European territories situated between the two countries. I cannot remember whether the expression "spheres of influence" was used or not. In the document Germany said she was disinterested in Latvia, Estonia, and Finland, but regarded Lithuania as a part of "her sphere of influence." At the same time, Germany wanted to have an interest, but not political, in the Baltic ports which were free from ice. This, of course, was not acceptable to the Russians. Obviously, von Ribbentrop was acting on instructions, as he had booked a telephone call to Hitler, which came through at this time. He was told to accept the Soviet point of view.

For the Polish territory, a demarcation line was fixed. Whether it was marked exactly on a map or described in words in the document I cannot remember. The agreement reached about Poland was to the effect that both powers should settle all questions regarding that country at a final meeting. Regarding the Balkans, it was established that Germany should have only economic interests.

The non-aggression pact and the secret documents were signed at a rather late hour of the same night.

Approximately one month later, at discussions about the second German-Soviet political treaty, the document mentioned above was altered—following a suggestion communicated by the Soviet government to Berlin earlier—to the effect that Lithuania was to be taken out of the "German sphere of interest," except for a "Lappet" [an overhanging piece of land] adjacent to East Prussia. In return, however, the demarcation line in Poland was moved further to the east.

At subsequent negotiations, through diplomatic channels, either at the end of 1940 or the beginning of 1941, this diplomatic "Lappet" was given up by the Germans.

The document not only exposed Stalin and Hitler's political goals, but it was staggering evidence of their willingness to wage war and to share the spoils of war between themselves by dismembering smaller countries.

Dr. Seidl had no illusions as to why he had been given access to the document by an American officer who feared Stalin's intentions in Eastern Europe and a Cold War in Western Europe through the rise of Communist parties in France and Italy. But he was ready to carry out his duty to his client, who sat in the dock reading a novel, appearing to have not the slightest bit of interest in the proceedings.

On March 30, 1946, Dr. Seidl produced his astonishing surprise when he cross-examined Von Ribbentrop about the secret German-Soviet agreement in 1939. Reluctantly, Von Ribbentrop admitted it existed. "If war broke out, occupation of these zones was to be undertaken by Germany and Russia. At that time, I heard expressions—both from Stalin and Hitler—that Polish and other territories thus delineated were regions which both sides had lost in an unfortunate war."

The shocked judges ordered Dr. Seidl to halt his cross-examination. He desisted, but told the court that the secret pact was an essential element in his defense of Hess and if the court did not allow the full details of the secret German-Soviet agreements to be called into evidence he would demand that Molotov, the Soviet foreign minister, be called as a witness. At least one of the prosecuting nations had been involved in the conspiracy that led to World War II, Dr. Seidl charged.

The Soviet prosecutor, General Roman Rudenko, jumped to his feet to protest and urged that the document be suppressed. "The court is investigating the case of the major German criminals. It is not investigating the foreign policy of the allies. This anonymous document . . . can have no value."

The judges conferred and upheld Rudenko's objection to the document being entered as evidence, but decided that Baron von Weizsäcker, a former secretary of state in the German foreign ministry, could be questioned about it. His testimony confirmed the existence of a secret pact and created a sensation when he told the court:

The secret protocol, of extensive scope, drew a line of demarcation between areas which in certain circumstances would be of interest to the Soviet Union, and those which would belong to the German sphere of interest. In the Soviet sphere were included Finland, Estonia, Latvia, the eastern parts of Poland, and certain parts of Romania. Everything west of that line was left to Germany. Later, in September or October 1939, amendments were agreed upon by which Lithuania, or the greater part of it, was transferred to the Soviet sphere, and the line of demarcation in Poland was moved considerably to the west. Explicitly, or implicitly, the secret agreement was to create a completely new order in Poland. And when it came into operation, this line of demarcation was followed closely.

When the British Lord Justice Lawrence asked Baron von Weizsäcker if he knew whether the secret pact existed in writing, the former foreign office official replied: "I kept a photostatic copy of that pact in my safe and I will have no hesitation in recognizing it if it were put to me." Before Dr. Seidl could present his document to Von Weizsäcker its authenticity was challenged, and Dr. Seidl could only reply that it had been given to him by an unidentified

allied army officer. The judges conferred again and ruled that since the origin of the document in the courtroom was unknown, it could not be put before the witness.

Dr. Seidl's efforts bore bitter fruit. He had revealed to the world that a heinous secret pact existed, but the ruling to prevent him from producing the actual document in court prevented him from aiding the defense of his client. Rudolf Hess was not found guilty of crimes against humanity and war crimes, but he was found guilty of conspiracy to wage aggressive war and of crimes against peace. He was sentenced to life imprisonment on October 1, 1946. The Soviet member of the tribunal objected to Hess's sentence, arguing that Hess should have been sentenced to death. Hess spent the rest of his life in prison until he died by suicide at age ninety-two, on August 17, 1987, the last of the convicted Nazi war criminals and the sole occupant of West Berlin's Spandau prison. The Soviet Union rejected all efforts to permit Hess early release.

Had Hess been released, his family and those who urged his release would have been free to draw attention to Stalin's own guilt for crimes against peace and conspiracy to wage aggressive war.

Abbreviations

ACP(b):	All-Union Communist Party (bolsheviks)
CC of RCP(b):	Central Committee of Russian Communist Party (bolsheviks)
CPSU:	Communist Party of the Soviet Union
GRU:	Main Intelligence Directorate of the General Staff of the Soviet Armed Forces
GULAG:	Chief Administration of Collective Labor Camps
NEP:	New Economic Policy
NKVD:	People's Commissariat of Internal Affairs
NSDAP:	National Socialist Workers' Party (Germany)
OKH:	Army High Command (Germany)
OKW:	Supreme Command of the Armed Forces (Germany)

Notes

Author's Note:

Readers may notice that several sources are quoted without full details (city, publisher, page number). My friends and anonymous supporters often send me photocopies of documents without these details. As I live in hiding in the U.K. (the Soviets sentenced me to death for defecting to the West in 1978), getting the original source data is often very difficult. But I do not doubt the veracity of my sources: for the last twenty years my sources have never been challenged by critics, even those who disagree with my conclusions. However, readers who feel that missing source details are absolutely necessary are invited to e-mail their requests to info@suvorov.com. My friends and I will do our best to oblige.

Preface

1. GULAG —*Glavnoe Upravlenie Lagerei* (Main Directorate of Correctional Labor Camps, Labor Settlements and Places of Incarceration), one of the names for the Soviet prison system. It became part of the NKVD—*Narodnyi Commissariat Vnutrennikh Del* (*People's Commissariat of Internal Affairs*) from 1930, and then became a part of the MVD (Ministry of Internal Affairs) in 1956.

Introduction

1. This name has been used since 1942. Other names were used before, but in this book, only GRU is used.
2. *Soviet Military Encyclopedia* (Moscow: Voenizdat, 1976), 5:67.

Chapter I

Epigraph: Lev Davydovich Trotsky, speech during seizure of power, third speech at the Second All-Russian Conference of Soviets, October 26, 1917.

1. Out of an agreed-upon 245 tons of gold, 92 were delivered to Germany, but confiscated from it by victorious France.

Chapter 2

Epigraph: *Zhizn Natsional'nostei*, no. 6 (1918).

1. Vladimir I. Lenin, *Complete Collected Works*, 5th ed. (Moscow: Politizdat, 1977), 41:353.
2. *Ibid.*
3. V. Ivanov, "Requiem on Victorious Steel Drums, in *Ural*, nos. 2–3 (1994): 242; N. Kakurin and B. Melikov, *Civil War in Russia: War with the White Poles* (Moscow: St. Petersburg, 2002), 670.
4. Kakurin and Melikov, *Civil War in Russia*, 556.
5. *The Comintern and the Idea of the World Revolution: Documents* (Moscow: Nauka, 1998), 186.

6. L. O. Frossard, *De Jaurès à Lénine: notes et souvenirs d'un militant* (Paris: Bibliothèque de documentation sociale, 1930), 137.
7. *Documents and Materials on the History of Soviet-Polish Relations* (Moscow: Voenizdat, 1964), 3: 221.
8. Kakurin and Melikov, *Civil War in Russia*, 434.
9. Vladimir I. Lenin, Ninth Conference of the Russian Communist Party, September 22, 1920.

Chapter 3

Epigraph: Joseph Stalin, “About the Polish Communist Party” (1926), republished in *Collected Works in 13 Volumes* (Moscow: Gospolitizdat, 1952), 6: 267.

1. Vladimir I. Lenin, “Report on Foreign and Domestic Policy,” delivered at the Eighth Congress of Soviets on December 22, 1920, published in *Complete Collected Works*, 143.
2. Lenin, *Complete Collected Works*, 358.
3. Walter Krivitsky, *I Was an Agent of Stalin* (Moscow: Terra, 1991), 97–98.
4. Ibid.
5. Alexander Kolpakidi and Dmitri Prokhorov, *Empire of the GRU: Sketches on the History of Russian Military Intelligence* (Moscow: Olma-Press, 2000), 1: 105–7.
6. *Rodina*, no. 10 (1990): 13.
7. “Politburo of the CC of RCP (b)—ACP (b) [Central Committee of Russian Communist Party (bolsheviks) —All-Union Communist Party (bolsheviks)] and Europe: Decisions of the ‘Special Folder,’ 1929–1939,” in *The Russian Political Encyclopedia* (Moscow, 2001), 21.
8. Ibid., 22–23, and Boris Bazhanov, *Memoirs of a Former Secretary of Stalin* (Paris: The Third Wave, 1980), 68–69. The most important fact is that Bazhanov summarized decisions, made in secret by the Politburo, with absolute certainty. His only mistake is with regard to the date: that session of the Politburo convened on October 4, 1923, not in September of the same year. In 2001 this decision, already unclassified, was made public. The abovementioned session of the Politburo really did consider the question of a specified date for armed insurrection in Germany. A small segment from protocol #38, made on October 4, 1923: “Determined: . . . 3. To agree with the commission with regards to the fixing of the deadline—the 9th of November, this year. 4. To apply all political and organizational efforts so that the appointed deadline may be met. 5. . . . It is to be remembered, that the course of action may lead to the inevitability of ordering the decisive advance ahead of the appointed deadline. . . . 7. To send to Germany comrades Pyatakov, Rudzutak, and Kuibyshev. . . . 11. To let those four [Central Committee members Radek, Pyatakov, Unshlikht, and Vasia Shmidt, NarKom of Labor] decide, upon arrival in Berlin, whether to include comrade Krestinskyi in their work, and, in case of being required to act in a conspiratorial manner, to have comrade Krestinskyi aid the group’s activities, allowing him equal voting power in all or some of their meetings. . . . 13. To increase the special fund by 500,000 gold rubles.” The decision to include Rudzutak among the four was not carried out due to the latter’s illness; instead of Kuibyshev, according to the Politburo decision on October 18, the People’s Commissar for Labor, V. V. Schmidt, joined its ranks. Nikolai Krestinskyi was then a plenipotentiary representative of the USSR in Germany. The sum mentioned here is for the deposition of the German government.
9. General Ioakim Vatsetis (1873–1938) was Commander in Chief of Soviet Russia’s armed forces in 1918–19.
10. Vyacheslav Menzhinskii (1874–1934) was one of the leaders of Stalin’s political police.
11. Meer Trillisser (1883–1940) was one of the heads of political police in the USSR.
12. Genrikh Yagoda (1891–1938) was one of the leaders of Stalin’s political police.
13. Gustav Stresemann (1879–1929) was *Reichchancellor* of Germany from 1923, and German minister of foreign affairs from 1923 to 1929.
14. Raymond Poincaré (1860–1934) was premier and minister of foreign affairs in France from 1912, president from 1913 to 1920, and premier once again from 1922 to 1924 and 1926 to 1929.
15. Krivitsky, *I Was an Agent of Stalin*, 49–50.
16. Speech on August 1, 1927, at joint plenum of the Central Committee and Central Control Commission of the Communist Party, quoted in Joseph Stalin, *Collected Works*, 10: 63.
17. Gustav Hilger and Alfred G. Meyer, *Incompatible Allies* (New York: Macmillan, 1953), 267.
18. Krivitsky, *I Was an Agent of Stalin* (Moscow: Sovremennik, 1996), 49–50.

19. Ernst Roehm (d. 1934) was one of the leading figures of the Nazi movement, second only to Hitler himself.

Chapter 4

Epigraph: Adolf Hitler, during a meeting with Lord Halifax, the British foreign minister, November 19, 1937.

Chapter 5

Epigraph: Adolf Hitler, *Mein Kampf* (Russia: T-OKO, 1992), 524.

1. *Voenno-istoricheskii Zhurnal (VIZh)* [Military History Journal], no. 4 (1989): 53.
2. *Bulleten Oppozitsii* [Bulletin of Opposition], no. 52–53 (October 1936): 42.
3. Robert Conquest, *The Great Terror*, translated from English into Russian (Florence, Italy: Aurora, 1974).
4. A. Antonov-Ovseenko, *Portrait of a Tyrant* (New York: Khronika, 1980), 296.
5. Joseph Stalin, in *Eighth Congress of the Communist Party: Protocols* (Moscow: Partizdat, 1959), 20.
6. Lenin, *Complete Collected Works*, 41: 353.

Chapter 6

Epigraph: Leon Trotsky, “Against National Communism!” *Bulleten Oppozitsii* [Bulletin of Opposition], no. 24 (August 25, 1931).

1. M. I. Meltiukhov, *Stalin’s Missed Opportunity: The Soviet Union and the Fight for Europe, 1939–1941* (Moscow: Veche, 2002), 511. As of January 1, 1928, the Red Army had forty-five Ricardo Mk V tanks, six Taylor Mk A tanks, and twenty-eight Renault FT-17 tanks, altogether seventy-nine foreign-made tanks. Mikhail Svirin and Andrei Beskurnikov, “First Soviet Tanks,” supplement to *M-Hobby* magazine (Moscow), no. 1 (1995): 43. The domestic production of tanks was launched in the 1928–29 business year. One hundred and twenty-two tanks were produced then: 121 MS-1 (T-18) tanks and one T-12. But only 96 MS-1s were accepted by the state acceptance commission. In 1932, 3,039 tanks and light tanks had already been produced. Overall, in the years of the first Five Year Plan, 3,949 tanks and light tanks were produced altogether. *History of the Second World War, 1939–1945* (Moscow: Voenizdat, 1973–82), 1: 260. By January 1, 1933, the Red Army had 4,538 tanks. Meltiukhov, *Stalin’s Missed Opportunity*, 515.

9. M. Maslov, "Dreadnought" in *M-Hobby* magazine (Moscow), nos. 5–6 (1997): 9, 11. The order to launch serial production of the TB-7 provided for the plans to produce eight lots of TB-7s, for a total of fifty-one aircraft. However, the order was never signed. Kazan Aircraft Factory #142, which was selected to produce the TB-7, had modern equipment, purchased in the United States and delivered to the factory. Actually, the factory had the capacity to produce up to one hundred TB-7s annually. If necessary, other factories could also have been switched to TB-7 production.
10. The TB-7 was completely unreachable until 1940, when the *Luftwaffe* started to receive mass deliveries of the Bf109 E-3.
11. The operational capabilities of the TB-7 bomber were described in an impartial, comprehensive, and detailed manner by Vladimir Ratkin, "PE-8 Testing by War," in the magazine *Mir Aviatsii* [The World of Aviation], nos. 1 and 2 (1996) and no. 1 (1997), as well as by N. Yakubovich, "The PE-8's Unenviable Fate," in the magazine *Krylia Rodiny* [Wings of the Motherland], no. 11 (1995) and no. 1 (1996); also in *USSR Aircraft Industry, 1917–1945* (Moscow: TSAGI Publications Department, 1994), 2: 68–69.

19. *Ibid.*, 182.

Chapter 9

Epigraph: Robert Goralski, *World War II Almanac, 1931–1945* (New York: G. P. Putnam's Sons, 1981), 164.

1. *Domestic Armored Vehicles, 1905–1941* (Moscow: Exprint, 2002), 235.
2. *Domestic Armored Vehicles, Twentieth Century*, 121, 127. In April 1938, a prototype of the infantry tank Mark II (A12) Matilda II was built in Britain. In armor thickness, this tank exceeded all other tanks around the world. Its frontal armor was 78 mm, its turret front armor was 75 mm, its side armor was 75 mm, and its aft armor was 55 mm; the T-28 had 30, 20, 20, and 20 mm armor; the T-28E had 50, 80, 40, and 40 mm armor. But the Matilda's weaponry was exceedingly weak: a 40-mm gun and one or two machine guns. There were two engines, 95 horsepower each. Because of the underpowered engines,

this tank—the pride of the British tank industry—could only handle its own weight on level ground or while going down hills. Each armored column of Matildas was escorted by a group of heavy trucks. Their task was to tow each Matilda uphill. The Matilda could only attack the enemy on level ground or roll down at the enemy from the top of a hill. If the reader is interested, I highly recommend the incredible book by D. Fletcher, *The Great Tank Scandal* (London: HMSO, 1990). By the beginning of World War II on September 1, 1939, the British army had only two of those tanks. The tank was slow and had a short range and unsatisfactory open terrain performance and reliability. All of the tank's parameters, with the exception of the armor, did not satisfy battlefield needs.

6. In the summer of 1941, the infantry tank Mark IV (A22) Churchill went into production in Britain. The first production model had the following armor: frontal armor 101 mm, turret frontal armor 89 mm. However, the tank was very weakly armed: a 40-mm gun and two machine guns. The Churchill had a very weak engine and, subsequently, low open-terrain capability and speed. The transmission was unreliable. The tank had an old-fashioned design. The body was assembled on a sub-frame made out of angle beams. Still plates were riveted to the sub-frame, with armor plating attached over them on bolts. Although the armor was very thick, the design lacked rigidity. In the Soviet tanks, the body was a box, welded out of armor plates. This gave the body superb rigidity. This was exactly the method used in the model tanks. Therefore, despite the impressive thickness of the armor, one is looking at a significantly lower technological level in British tank building. Winston Churchill joked that the tank, named after him, had even more shortcomings than he did.

15. Starting on September 3, 1939, and through May 8, 1945, Britain produced 25,116 tanks; from 1939 to 1945 Germany produced 24,242 tanks and Japan produced 5,085 tanks. Altogether, this came to 54,443 tanks. In the years of World War II, from the beginning of production in September 1940 and up to September 2, 1945, 54,853 T-34 tanks were manufactured.
16. *Encyclopedia of German Tanks of World War Two* (London: AAP, 1978), 261–62.
17. M. Bariatinsky, *Soviet Armor, 1939–1945* (Moscow: Bronecollectsia, 1998), 13–14. Starting in 1940, there were 33,805 T-34 tanks built, and 21,048 T-34-85 tanks were built from 1944 until the end of the war.
18. 2,644 SU-85 were produced and 2,495 SU-100. Altogether: 5,139. *Ibid.*, pp. 22–23.
19. Guderian, *Panzer Leader*, 283.
20. Steven Zaloga and James Grandsen, *Soviet Tanks and Combat Vehicles of World War Two* (London: Arms and Armour Press, 1984), 175.
21. V. Chalmaev, *Malysh, ZhZL series* (Moscow: Molodaia Gvardia, 1978), 299. Starting in 1942, in the competition for the quality parameters of the tank guns, the German designers achieved outstanding results. The 75-mm gun KwK 42 (with a 70-caliber barrel length!) that was used on a Panther gun was a designer's masterpiece. The 122-mm gun on the IS-2 and the 75-mm Panther gun had approximately the same effectiveness against the armor. The Panther gun's low caliber meant higher speed. The Panther's load was 79 to 81 rounds, but only 28 on the IS-2. This difference was caused by the lower internal volume of the IS-2 versus the "Panther." Also, the 122-mm gun required bigger and heavier

rounds. The German shell's initial velocity was higher than the Soviet one. Combined with excellent sights and optics, this gave it superiority over the IS-2 in precision. The Panther's armor-busting round weighed 6.8 kg and had an initial velocity of 925 m/s. The sub-caliber shell weighed 4.25 kg and had an initial velocity of 1,120 m/s. The armor-penetrating shell of the IS-2 had a lower initial velocity—790 m/s; however, the weight of the round was monstrous for that time—25 kg. The muzzle energy of the 122-mm gun on the IS-2 was one and a half times higher than the corresponding one on the Royal Tiger, two and a half times higher than the Tiger, and almost three times higher than the Panther. One good shot from the IS-2 redeemed the shortcomings of its gun. In October 1943, during tests at the Kubinka testing grounds near Moscow, an IS-2 with an armor-busting shell broke through the frontal armor of the Panther from a distance of 1,500 meters, then, having excess energy, the round went through the transmission, the armor wall of the weapon section, the engine, and even then, there remained so much energy that the round tore off the back armor wall of the body along the seams and threw it back several meters. The IS-2 tank gun was especially superior when engaging unarmored targets. The high-explosive fragmentation shell of the IS-2 weighed 25 kg against the 7 kg of the Panther shell. In general, what the IS-2 was needed for was not fighting Panthers and Tigers, but for breaking through the enemy's defenses. The main burden of fighting the heavy German tanks was assigned to the tank destroyer SU-100.

13. In October 1939, the 6th Armored Brigade (more than 250 BT tanks, commanded by Colonel M. P. Pavelkin) rode from Khalkhin-Gol to Urukhan covering a distance of 670 km. The ride was conducted with tracks removed and the tanks moving on wheels. It took thirty-nine operational hours for the ride to be completed, covering 150 km per 24-hour period on average. The brigade was awarded the Red Banner Order. It shows how impetuous and dangerous BT tanks could have been in breaking through an enemy's territory in case of a sudden blitzkrieg kind of war.

14. *Complete World Encyclopedia of Tanks, 1915–2000* (Minsk: Harvest, 1999), 123–24. For the first time in world history a truly amphibious tank was designed and built by the British firm Vickers-Armstrong in 1931. The vehicle was designated as the Vickers-Carden-Lloyd (A-4) and was considered a progenitor of all the amphibious tanks. It was never added to the British armored forces arsenal. Single units of this tank were sold to China, Japan, the Netherlands, and Thailand. This is another example of how the West did not use the great achievements of its designers, while the Soviet Union was able to appreciate and exploit these products.

9. Groehler, *Geschichte des Luftkriegs*. The majority of historians accept the data provided by German scholar O. Groehler as the most reliable—Hitler deployed against the USSR 3,520 planes, including 945 bombers, 400 dive-bombers and ground attackers (inclusive of sixty ground attack planes from the II.(Sch)/LG2 (formation number), 1,036 single-engine fighters, 93 two-engine fighters, 120 long-range

reconnaissance aircraft integrated into air fleets, 252 transport aircraft, 674 forward-based aircraft (the majority of which were range-reconnaissance aircraft). Hereby, if we would count bombers and fighters of all kinds, we will have 2,474 combat aircraft, that is, aircraft designed to destroy the enemy in air and on land.

13. Here is the structure of these corps in August 1941: 6th Air Assault Corps: Major General A. I. Pastevich, brigades 11, 12, 13 (Moscow district); 7th Corps: Major General I. I. Gubarevich, brigades 14, 15, 16 (Povolzhie); 8th Corps: Major General V. A. Glazkov, brigades 17, 18, 19 (Moscow district); 9th Corps: Major General M. I. Denissenko, brigades 20, 21, 22 (Ivanov district); 10th Corps: Colonel N. P. Ivanov, brigades 23, 24, 25 (Povolzhie, Gorokhovets camps).
14. *Encyclopedia of Aviation* (Moscow: Bol’shaja Rossijskaja Encyclopedia, 1994), 421.
15. The author of the idea to deploy tanks at the enemy’s rear by using gliders’ wings was the great American

designer Walter Christie. Back in the early 1930s he designed a draft of this concept. In the late 1930s Oleg Antonov borrowed the American idea and made it a reality. However, Antonov was too late by the time the war began. Besides, the war did not start the way Stalin had planned. A winged tank was flying in 1942, but nobody needed it in a defensive war.

16. *The Year 1941*, 2: 366–67. In 1941: land-based 5-seater gliders: 500; land-based 11-seater gliders: 1,000; 11-seater hydroplanes: 200; land-based 20-seater gliders: 300. Total for 1941: 2,000 units. Total for 1942: 5,500 units.
17. Index mark PS-84—passenger aircraft, factory #84. From September 17, 1942, the aircraft was named the Li-2 in honor of the engineer-in-chief of the factory, B. P. Lisunov.

23. Zhadov, *Four Years of War*, 16.
24. The “Guards” designation of military units appeared in the Red Army in September of 1941 as a part of Stalin's overall change from internationalist ideology and rhetoric toward nationalist Russian patriotism, as a means of rallying people towards the defense of their Russian motherland and not the international Communist expansionist movement. “Guards” units in tsarist Russia were the select, privileged, best-trained, and most reliable units prior to 1917.
25. *Krasnaya Zvezda*, September 25, 2002.
26. Yury Nenakhov, *Airborne Troops in the Second World War* (Minsk: Harvest, 1998), 194. The “Guards” designation was awarded to all newly formed air assault rifle divisions in recognition of the feats of their predecessors in the 1941–42 campaigns and as an advance for their future military contribution.

7. Roman Khrapachevskiy, “The Spanish Gold of the Kremlin,” *Russkiy Focus*, no. 7 (May 14, 2001). By 1936, Spain’s gold reserve was more than six hundred tons. When the military mutiny began, the major part of it was stored in the Bank of Spain cellars in Madrid. After consultations with Soviet representatives, the government of Spain approached Moscow with the request to “accept for storage” the gold of the Republic of Spain. The official reason for this was the threat of the mutineers’ takeover of Madrid in October 1936. On October 15, prime minister Francisco Largo Caballero and treasury minister Juan Negrin approached the Soviet Government with the suggestion to “accept for storage” more than five hundred tons of gold. Stalin immediately ordered the evacuation of the Spanish gold reserve. Here is a quote from the minutes of the Politburo of the Central Committee of VKP(b) meeting from October 17, 1936: “Paragraph 56. Comrade Rosenberg’s issue. Determination: To authorize Comrade Rosenberg to reply to the Spanish Government that we are ready to accept the gold reserve for storage, and that we approve the evacuation of this gold by our ships returning from [Spanish] ports.” After the political decision was made the operation began in full swing: on October 20, the cable with the approval came to Spain, and by October 22–25 it was already loaded on Soviet ships in Cartagena. The total cargo was 510 tons of gold.

Rozanov, *Stalin-Hitler: The Documented Story of the Soviet-German Diplomatic Relationship in 1939–41* (Moscow: Mezhdunarodnye Otnosheniya, 1991), 84–86. This decision was presented in the form of a telegram, sent by Molotov to the Soviet chargé d'affaires in Germany, Gheorghy Astakhov. He received the message on Saturday, August 12. The same day the telegram's content was conveyed to Hitler, who at that moment was negotiating with the Italian foreign minister Count Ciano. After some deliberation, Hitler told the following to the Italian minister about the telegram in the following way: "The Russians have agreed with the decision to send a German representative to Moscow to conduct political negotiations." Ciano himself left the following entry: "Russian-German contacts are developing very favorably and, specifically, several days ago came the Russian invitation to send a German plenipotentiary representative to Moscow to negotiate a Friendship Pact."
8. On August 19, 1939, Stalin gave an order to the Soviet Trade Mission in Berlin (not a direct one, of course) to immediately sign the Trade and Economic Agreement, which had been ready for a long time. The same day Stalin, via Molotov, told Schulenburg that Ribbentrop might arrive in Moscow on August 26–27. Later, Hitler tearfully begged to move Ribbentrop's visit to Moscow to August 23.

8. *Pravda* (September 3, 1939). The draft age of eighteen years was established for those who had graduated from high school. Mostly they were drafted into military schools (roughly equivalent to officer training schools)—willing or not.
9. "Operational and total strength of the USSR Armed Forces during the Great Patriotic War (1941–

- 1945),” *Statistical Digest*, no. 1 (June 22, 1941), (Moscow: Military History Institute, Ministry of Defense of the Russian Federation, 1994), 10–12; *50 Years of the Soviet Armed Forces* (Moscow: Voenizdat, 1968), 201; *History of the Second World War, 1939–1945*, 2: 199–202, 3: 418–19, 4: 18; *The Great Patriotic War, 1941–1945: Military History Essays*, 1: 89; *The Great Patriotic War, 1941–1945: Encyclopedia* (Moscow: Sovetskaya Encyclopedia, 1985), 311; Meltiukhov, *Stalin’s Missed Opportunity*, 292–95, 360.
10. The USSR Armed Forces’ strength by June 22, 1941, was 5,762,000, including the Red Army—5,081,000, navy—344,000, and interior troops and border guards—337,000. The numerical increase of the Red Army in 1939–41 was not a straightforward process of constant growth. Before Germany attacked the USSR, the Red Army reached its highest numbers not by June 22, 1941, but by September 20, 1939. By September 20, 1939, the Red Army—without the navy, interior troops, and border guards—numbered 5,289,400 men (in comparison to 5,081,000 by June 22, 1941). Here is how it happened: On the night of September 7, 1939, a decision was made to execute a partial mobilization of the Red Army. The troops were given the order to start a “Big Training Call-up” (BUS). Under the People’s Commissar Decree No. 2/1/50698 of May 20, 1939, the acronym BUS was a coded signal for the covert mobilization. BUS with an “A” designation meant deployment of individual units with the operational readiness date of up to ten days with their support elements reaching war-level strength. The mobilization was supposed to be executed with the maximum secrecy. All together, at the beginning of the “Big Training Call-up” were involved: headquarters of twenty-two rifle, five cavalry, and three tank corps; ninety-eight rifle and fourteen cavalry divisions; twenty-eight tank and three mechanized rifle/machine-gun; and one airborne brigade, deployed in seven military districts. In total, 2,610,136 men were drafted. Under the Presidium of the Supreme Soviet and People’s Commissar of Defense Decree No. 177 of September 23, they were declared mobilized until a “special instruction.” At the same time, under the Council of People’s Commissars of USSR Decree No. 1348-268cc from September 1939, a new military draft was supposed to start from September 5 to reinforce the troops in the Far East region, plus one thousand men for each newly formed division, and from September 15 to reinforce the troops in the rest of the military districts. Besides, under the new law regarding the universal military duty, the call-up period was extended by one year for 190,000 soldiers who were drafted in 1939. As a result, by September 20, 1940, the Red Army’s strength reached 5 million men. It was clear evidence of Stalin’s insecurity about Great Britain and France’s reaction to the Soviet invasion into Poland. Although he did everything possible to make Soviet actions not look like assistance to Hitler, there was a reason to be concerned that, after declaring war on Germany, London and Paris were going to declare war on the USSR as well. Once the intentions of the Western powers became clear, the Red Army began to deflate its swollen ranks, which had been prepared for a big war. A total of 1,613,803 men were retired from the Red Army from September 29 to January 7, 1940. However, when the war with Finland began it required that the Red Army’s losses be replenished and its strength boosted. On December 28, 1939, a decision was made to call up to the Red Army 546,400 men to reinforce the troops in the western military districts, as well as fifty thousand reserve officers. In the same time, in the Volga, Ural, and Siberian Military Districts 375,000 young men of five junior conscription ages were drafted. After the war with Finland was over, the Red Army started to decrease its ranks again, and reached its minimum strength by September 1, 1940: 3,423,499 men. Afterwards, the Red Army’s ranks started to increase again.
 11. *VIZh*, no. 3 (1999): 10.

Chapter 21

Epigraph: Colonel S. A. Vauptsassov, *At a Troublesome Crossroads: A Chekist’s Memoirs* (Moscow: Politizdat, 1971), 203.

1. *VIZh*, no. 7 (1982): 55.
2. Anthony Sutton, *National Suicide: Military Aid to the Soviet Union* (New Rochelle, NY: Arlington House, 1973), 152–53. According to the opinion of the American historian Anthony Sutton, the German delegation transferred to the Soviet Union blueprints of the most successful German submarine designs in June of 1926. The German V-III-class submarine was “the most successful design of all, ever produced.” In Sutton’s opinion, the Soviet Schuka-class submarine is based exactly on the

German V-III design, and the S-class is based on the German VII-class design. Sergei Gorlov, *Top Secret: The Moscow-Berlin Alliance, 1923–1933* (Moscow: Olma-Press, 2001), 264. In the opinion of the Soviet scientist S. A. Gorlov: “It is, of course, difficult to imagine that Soviet shipbuilding, from which in German professional opinion ‘nothing could be learned,’ all of a sudden could develop several promising types of submarines. Even though such ship designers as B. M. Malinin, A. N. Krylov, V. P. Kostenko, and others were naturally gifted talents, it is doubtful that they would have ignored such outstanding completed designs and other specific German assistance.”

3. A. B. Shirokorad, *Ships and Cutters of the USSR Navy, 1939–1945* (catalog) (Minsk: Harvest, 2002), 241. The following details are of interest: the construction of the ship commenced on January 11, 1937, in Livorno—in other words, at a time when Soviet and Italian “volunteers” were killing each other in Spain. The acceptance act was signed on April 18, 1939, after the unarmed ship, camouflaged as a merchant vessel and manned by an Italian crew, departed for Odessa, where it arrived on May 5, 1939.

10. *Ibid.*, 1: 161.
11. *Ibid.*, 3: 50–51.
12. Several armies that were created for the purpose of attack were officially called “shock” armies from 1942. But the term was unofficially used from the mid-1920s in Soviet military theoretical works. These armies were better equipped than the ordinary ones.
13. Boris V. Sokolov, *The Cost of Victory (Great Patriotic: The Unknown About the Known)* (Moscow: Moskovskiy Rabochiy, 1991), 64–66. The losses of explosives and ammunition production capacities were exceptionally high, one could even say catastrophic. The Soviet Union could not fight Hitler with the remaining 15 percent capacity. That is why, from the beginning of the talks on the Lend-Lease supplies, Stalin and his representatives were asking first of all for the explosives and powder to be sent. From mid-1941 to mid-1945, the production of explosives in the USSR came to 600,000 tons. R. H. Jones, *The Roads to Russia: United States Lend-Lease to the Soviet Union* (Norman, Oklahoma: University of Oklahoma Press, 1969), appendixes. The United States supplied 295,600 tons of explosives. *Soviet Foreign Policy in the Period of the Great Patriotic War* (Moscow: Gospolitizdat, 1946), 145–47. Additionally, Great Britain and Canada delivered 22,300 tons of powder. Therefore, Western deliveries of explosives reached 53 percent of the total volume of Soviet production. Also, the delivery of American equipment for the production of bombs, shells, and ammunition played a tremendous role in the course of the war. Specifically, in June of 1942, the most modern equipment for the daily production of 10 million 7.62-mm rounds (3.5 billion rounds a year) was delivered. Without this truly crucial assistance, the shell and round shortage that struck the Red Army in the fall of 1941 would not have been overcome.

Chapter 22

Epigraph: Jan Gamarnik, Chief of the Political Directorate of the Red Army, in a speech given at a meeting of the National Committee for Defense of the USSR on March 15, 1937.

The 106th Rifles Division was organized in accordance with the October 25, 1939, order of the USSR Defense Commissar. Shortly before the beginning of the war, the division was reorganized as a special corps with the same number, although at that time the Red Army rifle corps were numbered only up to fifty-six. The commander of the corps was Division Commander A. M. Anttila. On November 23, the corps was renamed as the 1st Alpine Rifle Corps of the Finnish People’s Army. It was staffed with the Finns

and Karelians that lived in the Leningrad military district. By the beginning of the war Anttila's corps, which consisted of two twin regimental divisions, numbered 13,405 personnel. However, there were not enough Finns and Karelians; therefore many Russians and Ukrainians, especially officers, were entered in the roster as Finns and Karelians. For example, the corps' chief of staff, Brigade Commander F. N. Romanov, was named "Raikas," and the headquarters' political department chief, Regimental Commissar V. P. Tereshkin, was called "Tervonen."

2. *Ibid.*, 186.
3. One can argue that Hitler's invasion was launched not only from Eastern Prussia and Poland, but from Finland, Hungary, and Romania as well. This is true. However, the USSR and Hungary did not share a common border. It was the Red Army who reached the Hungarian border as a result of the "Liberation March" in September 1939. As a result Hitler was handed an opportunity to attack from that nation's territory, which he did in 1941. Before 1941 there were no major German military units in Romania and Finland. They were deployed there because of Stalin's aggression against these countries. In order to protect themselves against Stalin, the Romanian and Finnish governments allowed German troops to use their territory.

8. The construction of the Dnepr-Bug canal started back in 1775. After ten years, this artificial waterway was officially commissioned as the Royal Canal; then it was abandoned. The restoration of the canal started in 1837, with the main work conducted in 1846–48. From 1851, the canal served as the shortest route between Eastern Europe and the Rhine-Atlantic waterway system. In 1918 and 1920, it was completely abandoned once again. In 1940, the canal was restored and rebuilt: its dimensions were brought to a level acceptable to the river-sea class combined navigation vessels. The total length of the canal was combined from the channeled part of the Pina River (74 km), the canal waterway (58 km), and the channeled part of the Mukhavets River (64 km).

2. *VIZh*.
3. *VIZh*, no. 10 (1972): 83.
4. Meltiukhov, *Stalin's Missed Opportunity*.
5. In accordance with Soviet military theory, a special designation was assigned to the armies that were reinforced and intended for rapid advance in the main strategic direction. This designation only appeared in Soviet military nomenclature in 1930 and was internal. In 1941, the designation became open and was used in identifying armies. Although the 9th Army was not officially called “Shock,” it was equally equipped, staffed, and trained to qualify as a “shock” army. See note for chapter 21.
6. On September 16, 1939, the Cavalry Army Group of the Kiev Special Military District (under the command of II-degree *Komandarm* I. V. Tiulenev) was renamed the Kamenets-Podolsk Group; on September 20 it was rechristened as the Southern Group, and starting September 24 it became the 12th Army.

Chapter 33

Epigraph: Soviet-Nazi Relations, 1939: Documents and Materials on the Soviet-German Relations in April–September 1939 (Paris and New York: Tretia Volna, 1983), 326.

1. *Stalin's Politburo in the 1930s: A Collection of Documents* (Moscow: AIRO-XX, 1995), Document #17; *Izvestia*, May 7, 1941. Until recently it was widely assumed that it happened on May 6, when the Presidium of the Supreme Soviet of the USSR issued a decree regarding the appointment of Joseph I. Stalin as the Chairman of the People's Commissars Council. However, the appropriate decision of the Politburo of the Central Committee of the VKP (b) was made on May 4. Stalin's appointment as the Chief of Government was justified in this top-secret decision by the “tense present-day international situation.” In the non-classified section of the Supreme Soviet of the USSR Decree concerning Stalin's appointment there was no justification for it—Stalin simply filled a vacant position. According to the Presidium's Decree, Molotov was relieved of his duty as chairman of the People's Commissars Council because he repeatedly complained about the difficulty of combining two positions—that of the Chief of Government and the Foreign Affairs People's Commissar.
2. *VIZh*, no. 9 (1965): 66.

4. I. Bagramian, *This Is How the War Began* (Moscow: Voenizdat, 1971), 62. The explanation offered by Marshal of the Soviet Union Ivan Bagramian completely matches the opinion of Soviet historians: “In May the international situation remained tense. The Soviet Union was preparing to rebut. This is exactly how we in the military district HQ had interpreted Stalin's appointment as the Chairman of the People's Commissars Council.

1. Nikolai G. Kuznetsov, *On the Eve of . . .* (Moscow: Voenizdat, 1966), 321.
2. Peter Chamberlain and Chris Ellis, *British and American Tanks of World War II* (New York: ARCO, 1969), 66.
3. Winston Churchill, *The Second World War* (Moscow: Terra, 1998), 3: 80. The losses of the British merchant and navy fleets (in imperial tons, where 1 imperial ton is equal to 1.016 metric ton) were as follows: January—320,000, February—402,000, March—537,000, April—654,000, May—500,000, June—431,000.
4. *Foreign Affairs Documents, 1940–22 June 1941*, 21: 2: 739. A warning about a possible German attack came from the British government only on June 16, 1941. British ambassador Cripps was not in Moscow and the warning about the possible German invasion was handed to the Soviet ambassador in London, Maisky, who immediately transmitted the message to Molotov in Moscow. Here is the beginning of this quite long message: “Today, Cadogan, upon Eden’s directive, provided me with more detailed information about the concentration of German troops at the Soviet border. . . . Total number of German troops presently concentrated at the Soviet borders, according to British General Headquarters data, is eighty divisions in Poland, thirty in Romania, and five in Finland and northern Norway, total 115 divisions, not counting the mobilized Romanian army.” Further on, there was a detailed description of which German troops were at the border, and when and where they went. One notices the outstanding work of British intelligence, which reported absolutely precise data about the German invasion army. Now we know that by June 22, 1941, 125 divisions and two brigades were deployed in the first strategic echelon of the German invading army, in other words, along the Soviet borders. By mid-June, most likely, there were 115 divisions, as the message reported. Stalin did not believe this message, since all previous messages gave him reasons for doubt. Most importantly, however, Stalin, at that time, had his own plans for Germany.

Conclusion

Epigraph: Nikita Khrushchev, at a Kremlin reception for foreign diplomats and journalists, November 1956.

1. *The Year 1941*, 1: 377.
2. *Ibid.*, 383.
3. Formally, besides the USSR, two more countries expanded their borders as a result of World War II: Yugoslavia and Poland. Yugoslavia got a significant chunk of land—practically the whole Istria (with the exception of Trieste), and Zadar (Zara). Poland's borders moved westward, while a wide swath of Polish territory in the east was seized by the USSR. The size of the territory Poland acquired in the west is quite comparable to that lost in the east. On the other hand, in 1945 both Poland and Yugoslavia were loyal satellites of the Soviet Union. It was expected that in the near future both nations would become a part of the USSR. Thus, one way or another, in terms of territorial expansion, Stalin benefited from World War II.

About the Author

Viktor Suvorov is the pen name of Vladimir Rezun, 61, who was born in the USSR. Suvorov is the author of eighteen books, including three works of fiction. His books have been published in more than thirty languages. In Russia and Poland they have sold more than a million copies. Suvorov was a Soviet Army officer who served in military intelligence (GRU). In 1978, when stationed in Geneva under cover as a Soviet diplomat, he defected with his wife and two young children to the United Kingdom, where he worked as an intelligence analyst and lecturer. He lives in hiding in England because he was sentenced to death by a Soviet military court, and today's Russia has refused to pardon him.

The Naval Institute Press is the book-publishing arm of the U.S. Naval Institute, a private, nonprofit, membership society for sea service professionals and others who share an interest in naval and maritime affairs. Established in 1873 at the U.S. Naval Academy in Annapolis, Maryland, where its offices remain today, the Naval Institute has members worldwide.

Members of the Naval Institute support the education programs of the society and receive the influential monthly magazine *Proceedings* or the colorful bimonthly magazine *Naval History* and discounts on fine nautical prints and on ship and aircraft photos. They also have access to the transcripts of the Institute's Oral History Program and get discounted admission to any of the Institute-sponsored seminars offered around the country.

The Naval Institute's book-publishing program, begun in 1898 with basic guides to naval practices, has broadened its scope to include books of more general interest. Now the Naval Institute Press publishes about seventy titles each year, ranging from how-to books on boating and navigation to battle histories, biographies, ship and aircraft guides, and novels. Institute members receive significant discounts on the Press's more than eight hundred books in print.

Full-time students are eligible for special half-price membership rates. Life memberships are also available.

For a free catalog describing Naval Institute Press books currently available, and for further information about joining the U.S. Naval Institute, please write to:

[WW2 Operation Barbarossa 1941 - the Real History version](#)

The trouble with historians is that they concentrate exclusively on the question of *what* happened, and never on the *why* it happened. This goes with a territory - that is what being a historian is all about; a sort of a journalist of the past, reporting the news as they happened, and not as they happen.

This leads to a problem, however.

Some facts get obscured by others, in effect they become forgotten, and so an unclear, muddled picture of the past emerges. Many historians, some because they are ordered to by their government, others because of nationalism, are inherently biased, and so pick and choose the reported facts. Many times, the original documents are missing, or kept stored in secret safes, never to be seen by the world's public as they would embarrass the country...

So a kind of a dogma, almost a religious cult, with all the heated passions, springs up about historical issues. Especially if it involves your country, which is pure as the driven snow, and would never, ever do bad (exception - if you lose the war, you are fucked, as it is commonly known that "the victors write the history books").

And so it was that the narrative, the evil Nazi Germany invaded the peaceful, innocent Soviet Union in World War 2 took hold.

Enter [Icebreaker by Viktor Suvorov](#).

In 1939, due to Stalin's political maneuvering, Hitler is made to act the part of the "Icebreaker of the Revolution", and entangles Europe (and the world) in a global, terrifying war. The Soviet Union is officially not involved.

In 1941, Soviet Union was finishing a gigantic national mobilization, and getting ready to attack its then ally, Hitler's Nazi Germany (and German allies).

Lets look at the history in some detail.

The revolution in 1917 which happened in Tsarist Russia, overthrew the Tsar put the Bolshevik party in power. The Bolsheviks were communists - the followers of the theoretical ramblings of Marx and Engels (German philosophers), advocating a "socioeconomic structure that promotes the establishment of a classless, stateless society based on common

ownership of the means of production" ([Wikipedia Communism entry](#)).

"Will it be possible for this revolution to take place in one country alone? No." - Friedrich Engels, *The Principles of Communism*, 1847

The Bolsheviks faithfully followed Marx and Engels' teachings on the need to change the world from the capitalist system into the communist one. Effectively, this meant a declaration of war by the Soviet Union against all non-communist countries in the world, to change their system of government.

"The bourgeoisie still rules over much of the world and so most Communist Parties and also the Communist International as the united party of the world revolutionary proletariat have to fight it." [Communist 3rd Congress: The Organisational Structure of the Communist Parties, the Methods and Content of Their Work, 1920](#).

The Third Communist Congress quotes:

"Before the revolution, and even after it, we thought: either revolution breaks out in the other countries, in the capitalistically more developed countries, immediately, or at least very quickly, or we must perish. In spite of this conviction, we did all we possibly could to preserve the Soviet system under all circumstances, come what may, **because we knew that we were not only working for ourselves, but also for the international revolution**" [1921, 3rd Congress theses](#)

"We Marxists do not belong to that category of people who are unqualified opponents of all war. We say: our aim is to achieve a socialist system of society, which, by eliminating the division of mankind into classes, by eliminating all exploitation of man by man and nation by nation, will inevitably eliminate the very possibility of war."

[Article in Pravda No. 93, written by Lenin](#)

The Bolshevik, later called the Communist Party of the Soviet Union - they saw themselves as the vanguard of the world revolution, because that was its *raison d'être* (its reason for existence): from [worldrevolution.org.uk](#): "Lenin stressed, as Karl Marx had done before him, that in order for Socialism to succeed, capitalists would need to be overthrown in several advanced countries too. He took the lead in organising a new world revolutionary party, the Communist (Third) International in 1919 after the betrayal of the Socialist (Second) International. The Third International bound revolutionary parties from all over the world in a common fight to repeat the successes of October 1917 and open the road to world socialism."

After Lenin came Stalin. And an abrupt change happened in the Soviet Union's policies.

[From the Wikipedia:](#) "Socialism in One Country was a thesis developed by Nikolai Bukharin in 1925 and adopted as state policy by Joseph Stalin. The thesis held that given the defeat of all communist revolutions in Europe from 1917–1921 except in Russia, the Soviet Union should begin to strengthen itself internally".

So, all the revolutions that sparked up in European countries in the 1920's were defeated. Again, same article: **"This theory was in an opposition to Lenin's beliefs that while a revolution may happen in one country, the final success of socialism in one country, especially in such a backward one as Russia, is impossible without proletarian revolutions in other, advanced countries of Western Europe"**.

So at first glance we have Stalin paying put to all talk of world revolution, and concentrating on internal national problems in the Soviet Union.

Seemingly.

I am a big fan of taking a look at what a politician is doing, as opposed to what he is saying (The old adage of "When do you know a politician is lying? When his lips are moving!"). So let's take a look at what was happening in the Soviet Union when Stalin ruled it with an iron hand. Lets...

1928: Stalin overturns the Lenin policy of the capitalism lite New Economic Program (NEP - google it yourself). In [this speech in 1928](#), Stalin explains himself: "The independence of our country cannot be upheld unless we have an adequate industrial basis for defence. And such an industrial basis cannot be created if our industry is not more highly developed technically".

What this lead to in practice, was that all the national resources went into heavy industry, such as iron mills, factories and the like. This left the ordinary people genuinely fucked. For example, the peasants experienced the joys of Collectivisation, which is a fancy word for the communist government thugs taking private farms away and putting all peasants into government run farms. And establishing quotas of grain and wheat production.

Failure to produce said quotas resulted in executions, and the policy itself resulted in mass starvation and cases of cannibalism. According to Robert Conquest in his book *The Harvest of Sorrow: Soviet Collectivisation and the Terror-Famine*, this policy resulted in 7 million deaths.

Effectively then, Collectivisation was modern day work slavery, similar to American South exploitation of blacks. The policy itself resulted in millions of victims. This is a good [webpage primer on the reality of communist rule](#)

. For a good scholarly study, read the preview of [The Economic Transformation of the Soviet Union by Davis, Harrison and Wheatcroft](#). Highly recommended, and free to you online.

But the policy itself was successful. It made the Soviet Union into an economic powerhouse, despite the millions of dead, starving or resettled victims in the Gulags. This was observed by (then) Colonel Heinz Guderian, as he visited the Kharkov Tank Factory in 1933 (the two socialist countries, Germany and Russia, were allies back then): it produced 22 tanks per day. This is pretty staggering, as Germany entered WW2 with just 3195 tanks... Or about 159 days of just one Soviet factory production. This is taken directly from Icebreaker and [Defense conversion Strategies by NATO ASI series](#).

By my standards, Stalin's industrialization was successful - it accomplished its goals to make the country into a modern military power. 22 tank produced per day in just one factory in one city... in 1933.

I will pause here and let you think on that for a second. Take a deep breath.

Ready? Moving on now...

Before there was WW2, there was the Molotov-Ribbentrop Pact. Read up the [bullshit version on Wikipedia](#), ponder them, and then come back here.

"For a long time, the primary motive of Stalin's sudden change of course was assumed to be the fear of German aggressive intentions." That was before Suvorov's Icebreaker book came out, that is.

First fact: Hitler's Nazi Germany and the Soviet Union attacked Poland together in 1939, as they agreed to in the pact. You can see some pictures of German and Soviet soldiers yukking it up in 1939 in Poland [here](#) and the actual documentary film [here](#) - the second link is recommended.

Second fact: Despite the Soviet Union being an ally of Hitler, and invading Poland together with Germany, the French and UK governments only declared war on Germany in 1939. They did not declare war on the second aggressor and Nazi ally, the Soviet Union...

I will let you think on that for a second. Take a deep breath, exhale...

OK, moving on.

So, to sum up the Molotov-Ribbentrop pact - Western Europe was at war with Nazi Germany, while the Soviet Union stayed aloof from the fracas. They were at peace.

But that is not the whole picture, far from the truth at all about that period of WW2. While Germany annexed the western part of Poland, the Soviet Union took over [the eastern part, totaling 201,015 km² and a population of 13.299 million.](#)

Hardly the action of a peace loving country.

In early 1940, Germany invaded Denmark and Norway. The peaceful and not involved in the raging world war Soviet Union, took over [Estonia, Latvia, and Lithuania.](#)

What we see here are actions of two allies, two predators, two animals of the same ilk. But in popular WW2 schoolbook history, we somehow learn only about how Hitler's Germany was the evil country and the sole source of WW2. The Molotov-Ribbentrop pact is explained as a play for time, to buy time to prepare by the Soviet Union for the inevitable German invasion.

I hope that the previous list of Soviet (and German) aggressions persuaded you that that view of WW2 history is bullshit.

If not, I will let Suvorov explain it all again:

In September 1939, the Soviet Union declared itself neutral and, during the 'pre-war period', seized territories with populations totalling 23 million people - not bad going for a neutral state.

The Red Army and the NKVD perpetrated fearful crimes in these captured territories. Soviet concentration camps were crammed with imprisoned soldiers and officers from a number of European countries. Officer prisoners, and not only the Poles, were shot in their thousands. This is not the action of a neutral state.

Here is a strange state of affairs. Germany attacked Poland, which means that Germany was the instigator of, and participant in, the European and then the World War. The Soviet Union did the same thing in the same month, but it does not judge itself to have been an instigator of the war. Nor does it consider itself even to have then been a participant in the war.

A Polish soldier killed in battle on Polish territory against the Red Army is considered a participant in World War II, as well as its victim, while the Soviet soldier who killed him is regarded as 'neutral'. If in the same battle a Soviet soldier is killed, then it is judged that he has been killed not in wartime but in peacetime - in the 'pre-war period'.

To further set the stage, I will let Suvorov quote Pravda articles from these days when Nazi Germany and Stalin's Soviet Union were allies: The foundations of the earth are trembling,' it wrote. 'The ground slips from under the feet of peoples and nations. Glows are afire in the sky and the thunder of guns shakes seas and continents. Powers and states are blown away just like chaff in the wind. How excellent it is, how extraordinarily wonderful, when the world is shaken to its very foundations, when powers perish and greatness falls.' (Pravda, 4 August 1940) 'Every such war brings us closer to that happy time when murders among the people will no longer happen. (Pravda, 18 August 1940)

The Soviet newspaper article writers were bursting with unbridled joy and happiness that the capitalists are killing each other.

The Soviet general Krivoshein, who in 1939 took part in the Nazi-Soviet victory parade in Brest, Poland, had this to say: "We have concluded a treaty with the Germans', he said, 'but this means nothing. Now is the most wonderful time to solve all world problems once and for all, and in a constructive way.' (Ratnaya ByV, Molodaya Gvardiya, 1962, p. 8)"

"Divide our enemies, meet the demands of each of them temporarily and then destroy them one at a time, giving them no opportunity to unite. (Pravda, 4 March 1941)"

This is what the outlook was of the hapless, unprepared for war Soviet Union, just trembling and cowering before the might of the mighty Wehrmacht.

I will pause again and let you process this information. Go to the restroom, grab a drink, make some popcorn, get some cookies... Ready?

Suvorov uses those two most dangerous weapons of all, *logic and common sense*.

He calmly states that, if the Soviet Union was interested in protecting its national territory, it would have kept Poland, Lithuania, Latvia and Estonia as buffer states, and warned Germany not to invade them. After all (using that dangerous common sense again) it would be very hard for Germany to invade the Soviet Union if they did not have a common border!

The apologists for the Soviet Union claim that the attack on Finland, the annexation of the Baltic countries (Estonia, Lithuania, Latvia) was all done to protect the Soviet Union. That is a strange, weird il-logic - I do not think that if any other country attacked and took over another country, and then claimed it was for self defense, that that argument would work.

But this is the Soviet Union's history, and that argument is discussed and agreed upon in serious scholarly books and articles.

Suvorov then continues with his second logic and common sense attack on the biggest historical lie of WW2 (second only to Pearl Harbor - that blog post upcoming). Having gotten a common border with Germany, what should have happened is that the Soviet Army should have built their own version of the Maginot Line - it should have mined the bridges on the border, built bunkers, tank traps, machine gun nests, etc etc.

Suvorov explains:

A country which is preparing its defence deploys its army deep inside its own territory, and not on its very frontier. The object is to prevent the enemy from destroying the main defending forces with one surprise attack. A defending side will normally build a security zone in the frontier areas in plenty of time; a zone where the terrain has been saturated with traps, engineered defences, obstacles and minefields. The defending side will deliberately avoid constructing anything related to industry or transport in this zone; nor will it keep any heavy military formations or large quantities of supplies there. On the contrary, timely preparations will have been made to blow up all bridges, tunnels and roads in this zone.

Once inside the security zone, the aggressor loses speed of movement, and his troops sustain losses before they even encounter the main forces of the defender. Only small but highly mobile detachments of the defending side operate in the security zone. These detachments spring ambushes, launch surprise attacks and then quickly withdraw to previously prepared positions. Light detachments create the impression that

they are the main force, compelling the aggressor to stop, deploy his forces and waste his shells on areas where there is nothing to hit. The light detachments, meanwhile, secretly withdraw to prepare new ambushes.

While the aggressor is waging an exhausting battle with the light detachments of the covering force, the main defending forces have time to prepare themselves to confront the aggressor from positions which favour defence.

So how does that work in practice, Mr. Suvorov?

(...)the Red Army itself created strong security zones on its own frontiers, particularly its western borders. Special government commissions inspected the country's western regions and determined which zones an enemy would find easiest to cross, and which would afford him most difficulty. Teams of bridge-protection guards, trained in demolition work, were made ready to blow up all the bridges in the

western regions. The 60-metre long railway bridge at Olev, for example, could have been blown up by the duplicated explosion system in two and a half minutes. (I. Starinov, *Miny Zhdut Svoego Chasa*, Moscow Voenizdat 1964, p. 24)

Heavy pipe-lines, depots, water pumps, water towers, high embankments and deep cuttings were all prepared to be blown up. (Ibid, p. 18) By the end of 1929, 60 teams of demolition sappers, totalling 1,400 men, had been trained in the Kiev Military District alone. These had at their disposal '1,640 fully prepared sophisticated charges and tens of thousands of safety-fuse detonator sets, which were ready literally for instant use.' (Ibid, p. 22) Similar activity was also going on in other military districts.

In addition to the teams of demolition sappers which had been set up in the western regions of the country, railway-blocking battalions were formed. One of their tasks was to destroy the main railway junctions in the event of a retreat and to create defence obstacles on the main arterial routes by destroying roads and laying delayed-action land mines lest the enemy should try to rebuild the roads. There were four such battalions in the Ukraine in 1932. (Ibid, p. 175)

Railway points crossings, communications equipment, telegraph wires and in some cases even the rails were got ready to be removed. (M. Tukhachevsky, *Izbrannye Proizvedeniya*, Moscow Voenizdat 1964, Vol. i pp. 65-67)

The Soviet security zone underwent continuous improvements. The number of targets prepared for demolition steadily grew. New defence obstacles were created: forest barriers; artificial reservoirs in front of defensive constructions; preparations were even made to flood some areas.

The Soviet Union then declared war on Finland and experienced a security zone on its own attacking troops.

The failures of the Red Army on this occasion were not simply the results of miscalculations by the Soviet command. More important was the fact that the Finnish Army was prepared for defence, and ready to make sacrifices. The Finns had erected their security zone in front of their main line of defence. This zone - some 40-60 kilometres deep (*Sovetskaya Voennaya Entsiklopediya*, Vol. 6, p. 504) - was strewn with minefields and defence obstacles. Snipers, sappers and light mobile detachments were extremely active.

Suvorov continues the narrative:

All the Soviet commanders who fought there expressed their admiration of the Finnish security zone. Foremost among them was K. Meretskov, who commanded the 1st Army. (Na Sluzhbe Narodu, Moscow IPL 1968, p. 184) After he had finally overcome the Finnish security zone and had assessed its worth, Meretskov was appointed Chief of the General Staff. So how did he make use of his experience in order to reinforce the Soviet security zone which had been set up along the Soviet Union's western frontiers?

Meretskov ordered that:

1. The security zone which had previously been constructed along the Soviet Union's western frontiers should be dismantled, the teams of demolition sappers disbanded, the explosive charges removed, the mines rendered harmless, and the defence obstacles razed to the ground;
2. No security zone should be set up in the new lands;
3. The main forces of the Red Army should be moved right up to the frontiers, without a security zone to protect them;
4. The strategic resources of the Red Army should be brought from the heart of the country and concentrated directly on the frontier;
5. A vast works programme should begin at once to build a network of roads and airfields in western Byelorussia and in the western Ukraine: single-lane roads were to be made into dual-lane roads, the capacity of the roads was to be increased; and new roads leading directly to the German border were to be built.

Come again?

That does not plan like a defensive zone to act as a buffer between Germany and the Soviet Union. That sounds like a country that is expecting an invasion of... tourists, not enemy troops. Why was this enormous programme of public works undertaken, why did the Soviet troops move towards the border when the defensive obstacles were "razed to the ground"?

Perhaps Stalin was counting on an already existing fortification, already built. Perhaps... The so called Stalin Line did indeed exist.

In the 1930s, thirteen fortified regions, or URs, were built along the Soviet Union's western frontier, in a strip of territory which was unofficially called the Stalin Line.

The basic element of the fortified regions was the DOT, or permanent fire position. In its issue of 25 February 1983, the newspaper Red Star gave a description of DOT No. 112 in the 53rd UR, situated in the Mogilev-Podolsk region. This was one of the completely standard DOTs in the Stalin Line.

It consisted of complex tunnelled fortification defences, which contained communication trenches, caponiers, compartments and filtration systems.

It also had armouries, ammunition stores, food supplies, a medical unit, a mess room, water supply (which incidentally is still functioning), a recreation and reading room, and observation and command posts. The armament of the DOT consisted of machine-gun positions with three firing embrasures. In these posts there were three 'maxims' mounted on special turrets and two single-gun caponiers with a cannon in each one.

(...)

Colonel-General A. I. Shebunin, another participant in that mighty work of construction, tells us that in the Proskurov UR alone, more than one thousand reinforced concrete defence-works were constructed in just three years.

OK, so there was an already existing "Maginot Line" in the Soviet Union.

Curious thing happened though:

"In Autumn 1939, however, when World War II began and a common frontier with Germany was established, all construction work on the Stalin Line was stopped. (V. Anfilov: Bessmertnyi Podvig, Moscow Nauka 1971, p. 35)"

"The garrisons in the fortified regions of the Stalin Line were first reduced in size and then disbanded completely. Soviet factories stopped producing armament and special equipment destined for fortification installations. The existing fortified regions were dismantled, and their armament, ammunition and all observation, communications and fire-control equipment were put into storage. (VIZH 1961 No. 9, p. 120)"

I do not know how future historians will explain this crime against our people. Present-day historians pass over this event in complete silence, and I do not know why. The Soviet government fleeced its people of many billions of roubles (no less than 120 billion, according to my calculations) in order to build fortifications, impregnable to any enemy, along the entire western frontier, from sea to sea, from the grey Baltic to the azure Black Sea. Yet just before war broke out, in spring 1941, powerful explosions thundered along the 1,200-kilometre-long stretch of fortifications. Strong double and single caponiers built of reinforced concrete, firing positions with one, two and three embrasures, command posts, observation posts, and tens of thousands of permanent defensive installations were all blown up on Stalin's personal orders. (Major-General P. G. Grigorenko, VPodpol'eMozhno Vstretit' Tol'ko Krys, New York 1981, p. 141)

Come again?

Summing up - the old fortification on the old Soviet frontier was dismantled, its troop levels reduced, its armament put into storage. The

new frontier's defense zone was not built to compensate.

Besides, when defending yourself, two Maginot Lines are better than one, so even if you *did* plan to build a new Stalin Line on the new German-Soviet border, why in the world would you destroy the old one?

That common sense and logic again... Dangerous weapons indeed.

Instead of making bunkers and planting mines, the Soviet Army in 1939-1941 was busy training paratroopers. There were 10 Airborne Corps created pre war and during initial days of Barbarossa in 1939-1941 ([quoted figures from soldat.ru forum](#))

In the course of the manoeuvres held in Kiev in 1935, a parachute assault force of 1,200 men was dropped, immediately followed by an air-landed assault force of 2,500 men armed with heavy weaponry including artillery, armoured cars and tanks.

In Byelorussia in 1936, in the course of practising the same offensive theme, a parachute assault force of 1,800 men was dropped. They were followed by an air-landed assault force of 5,700 men armed with heavy weaponry. In the same year, the full complement of the 84th Rifle Division made an air-landed assault in the course of offensive manoeuvres in the Moscow Military Division.

Common sense and logic: paratroopers are not used in defensive, only in an offensive.

Need a break? No? Continuing...

Among the many defensive systems which the Soviet Union possessed was the Dnieper Naval Flotilla.

(...)

The formidable barrier formed by the Dnieper, the bridges ready to be detonated, and the river Flotilla working in cooperation with the field troops, artillery and air force, could have safely barred the way to the industrial regions of the southern Ukraine and the Soviet bases on the Black Sea. The German Blitzkrieg could have been stopped on the river-banks, or at least held up there for several months.

Instead of one defensive flotilla, Stalin then created two new ones, the Danube Flotilla and the Pinsk Flotilla. The Soviet Danube Flotilla was formed before the Soviet Union acquired an outlet to the Danube. In the course of Zhukov's 'liberation campaign' in the Romanian frontier regions, Stalin took Bukovina and Bessarabia from Romania. Right at the mouth of the Danube, a sector of the eastern bank of the river, some dozens of kilometres long, passed into the possession of the Soviet Union. The

Danube Flotilla, which had already been set up in expectation of this event, was moved there immediately

The Danube Naval Flotilla included about 70 naval river vessels and launches, sub-units of the fighter air force, and anti-aircraft and shore artillery. The conditions where the base had to be built were frightful. The Soviet bank of the Danube Delta was barren and exposed. The vessels had to moor at open berths, with Romanian troops sometimes only 300 metres away.

In the event of a defensive war, the entire Danube Flotilla would have fallen into a trap the moment hostilities began. The enemy could simply rake the Soviet vessels with machine-gun fire, preventing them from raising anchor and casting off. In a defensive war, moreover, the Danube Naval Flotilla would have had no useful function. Given its location, there were simply no defensive tasks for it to fulfil. The Danube Delta consists of hundreds of lakes, impassable swamps and hundreds of square kilometres of reed marshes. It is the last place through which an enemy would choose to attack the Soviet Union.

There was only one way to explain the siting of the Danube Flotilla; its purpose was to carry out combat operations upstream while Red Army troops were making a general advance. If you gather 70 river vessels in the delta of a great river, they have nowhere to go except upstream. This meant that they would have to operate on the territory of Romania, Bulgaria, Yugoslavia, Hungary, Czechoslovakia, Austria and Germany.

The Danube Flotilla was of no use to anyone in a defensive war, and it was condemned to be destroyed immediately in its open moorings on a bank raked by enemy gunfire. In an offensive war, however, the Danube Flotilla would be a mortal danger to Germany. It only had to move 130 kilometres upstream for the strategic bridge at Chernavada to come under fire from its guns. That in its turn would mean that the flow of oil from Ploesti to the port of Constanza would be cut off. Another 200 kilometres upstream and the entire German war machine would come to a halt simply because German tanks, aircraft and submarines would have been left without fuel.

Of course, the apologists for their version of history will tell us that everything that Suvorov writes about the flotilla was defensive in nature.

Which does not explain how, during the first day of the Axis invasion on the Soviet Union,

As soon as they learnt that the war had begun, the Soviet commanders put the finishing touches to their preparations to launch an assault landing operation. The action to be taken by the Soviet Flotilla commanders, and also by the commanders of the 14th Rifle Corps, whose divisions were

concentrated in the Danube Delta area, and by the commanders of the 79th Frontier Detachment of the NKVD, had been previously planned and worked out with great care. On 25 June 1941, the Danube Flotilla vessels, under cover of fire from the shore batteries and artillery of the 14th Rifle Corps, landed reconnaissance and sabotage sub-units of the NKVD on the Romanian bank. Regiments of the 51st Rifle Division of the 14th Rifle Corps were next to be landed. Members of the Soviet assault landing force acted swiftly and decisively. A complex operation involving river vessels, aircraft, field, shore and shipborne artillery, and sub-units of the Red Army and the NKVD had been successfully executed with clockwork precision. Everything had been prepared, coordinated, agreed and checked many times over. On the morning of 26 June 1941, the red flag was hoisted over the cathedral in the Romanian town of Kilia.

Kilia was roughly 130 kilometres from Ploesti, where the Romanian oilfields were. The oilfields which supplied the German Army in WW2 in oil, which were necessary to Nazi Germany's survival... Which was understood by all the allies, as the US Air Force [bombed it repeatedly](#). Germany got most of its oil from Romania (Ploesti refineries), and synthetic oil production - see [google answers](#). For the truly dedicated (like me!) nerds, look up [The Role of Synthetic Fuel In World War II Germany](#). I disagree with the author that "Yet a High Command study in May of 1941 noted that with monthly military requirements for 7.25 million barrels and imports and home production of only 5.35 million barrels, German stocks would be exhausted by August 1941. The 26 percent shortfall could only be made up with petroleum from Russia. The need to provide the lacking 1.9 million barrels per month and the urgency to gain possession of the Russian oil fields in the Caucasus mountains, together with Ukrainian grain and Donets coal, were thus prime elements in the German decision to invade the Soviet Union in June 1941", as it is bullshit...

And here is why:

The Soviet Union provided its ally Nazi Germany with 900,000 tons of mineral oil ([yale.com article](#)), per the Molotov-Ribbentrop agreement.

OK, now we are getting into the nitty gritty. Take a break, get a drink of your favorite alcoholic beverage, and come back.

Exactly **why** did Germany invade the Soviet Union in WW2?

The pro-Soviet version of history postulates various explanations:

- 1) Germany did it for lebensraum, per the incoherent and rambling 'Mein Kampf'
- 2) Germany did it for economic reasons - to grab oil, coal located on Soviet territory
- 3) Hitler was craaaaaaaazy

Reason 2 is a no go, as the Soviet Union supplied Germany with everything it needed to kill Englishmen and their allies: oil, iron, food stuffs.

Reason 1 stipulates that Hitler was insane, which leads into reason 3. Hooray!

The logic of "official" WW2 historians is.... strange.

I already quoted Suvorov on how the Danube flotilla behaved during the first day of war. How did the rest of the Soviet Army behave?

John Erickson's *The Road to Stalingrad*: "Stalin agreed to a second directive being issued, Directive nr. 2(...) Signed by Zhukov as Chief of the General Staff, the directive stipulated 'active offensive operations'. (pg. 124)". This went over the Red Army communication system on 22 June, 07:15 hours.

Directive nr. 3, prescribed "nothing less than all three Soviet Fronts (Soviet Army Groups on the German frontier) taking the offensive" This directive went out on the Red Army wireless on 22 June, 21:15 (pg 132).

Suvorov again:

In the first hours following the beginning of the German invasion, the Red Army kept on trying to go over to the offensive. Modern textbooks call what the Red Army was doing counter-strikes and counter-offensives. But it was pure improvisation. The problem of counter-strikes had never been worked through in any pre-war exercises, nor indeed had it ever been considered in theoretical terms: 'the subject of counter-offensive... had never been raised before the Great Motherland War'. (IVOSS (the official history of the 'Great Patriotic War'), Vol. i, p. 441)

Operations of the Soviet fleets in the first minutes, hours and days of the war show sufficiently clearly that they did have plans, but that these were not plans for defence. On 22 June 1941, Soviet submarines of the Black Sea Fleet immediately put to sea and headed for the coasts of Romania, Bulgaria and Turkey. The same day submarines of the Baltic Fleet set sail for the coasts of Germany, with a mission to 'sink all enemy ships and vessels, in accordance with the rights of unrestricted submarine warfare'. (Order of Officer Commanding Baltic Fleet, 22 June 1941, Plot v Velikoi Otechestvennoi Voine, Moscow Nauka 1980, p. 279)

Beginning on 22 June, the air arm of the Black Sea Fleet carried out active combat operations in support of the Danube Naval Flotilla with the objective of opening a way upstream for the flotilla. On 25—26 June,

surface warships of the Black Sea Fleet appeared off the Romanian port of Constanza and began an intensive artillery bombardment with the obvious intention of making a naval assault landing. At the same time the Danube Naval Flotilla began to carry out assault landing operations in the Danube Delta.

On 22 June, the garrison at the naval base at Hanko, on Finnish territory, instead of going over to a stonewall defence, initiated some sustained assault landing operations, and held nineteen Finnish islands for several days. On 25 June, in spite of the enormous losses which the Soviet Air Forces had sustained in the first hours of the war, 487 aircraft belonging to the Baltic and Arctic Fleets launched a surprise strike at Finnish airfields. Again in spite of these enormous losses, the Soviet air forces conducted themselves with exceptional valour and aggression. On 22 June the 1st Air Corps made a concentrated raid on military objectives in Königsberg.

None of this was improvisation. At 6.44 am on 22 June the Soviet Air Force was given the mission of operating in accordance with its plans, and for a few days it tried to do this. On 26 June, the 4th Air Corps began bombing raids on the Ploesti oilfields in Romania.

On 22 June 1941, the 41st Rifle Division of the 6th Army's 6th Rifle Corps, without waiting for orders from above, crossed the state frontier near Raval-Russkaya. That same morning, and without waiting for orders from Moscow, Colonel-General F. I. Kuznetsov, officer commanding the North-West Front, ordered his troops to launch an attack towards Tilsit in East Prussia. This decision came as no surprise either to the headquarters staff of the North-West Front or to the officers commanding the armies and their staffs, for a version of the attack on Tilsit had been played out in headquarters exercises held a few days previously, 'and it was very familiar to the commanders of the formations and their headquarters'. (Bor'ba za Sovetskuyu Pribaltiku, Eesti Raamat, Tallinn 1980, Vol. i, p. 67)

the commanders at tactical level were not entitled to know what their tasks would be, but in the senior headquarters, these tasks had been exactly defined and formulated, placed under seal in secret envelopes, and kept in the safe in every headquarters, up to and including the level of battalion. For instance, the Reconnaissance Battalion of the 27th Rifle Division, concentrated close to the frontier near the town of Augustow, was preparing to carry out combat reconnaissance in the direction of Suwalki. (Arkhiv MO SSSR, Archive 181, list 1631, item i, p. 128) The task of the Reconnaissance Battalion was to ensure the swift

advance of the entire 27th Division from near Augustow to Suwalki.

So using our two dangerous weapons - logic and common sense - let us attack now.

If the Soviet Union had no plans which the Army units could use in the event of an enemy attack on the country, if the military forces, when the enemy attacked, immediately went over the offensive themselves, when they were told by the Chief of Staff to attack, all Fronts, attack! ... What does that tell us the plans of the Soviet Union were in WW2?

End Game

Constantine Pleshakov, freely available in the USA, and at [Amazon.com](https://www.amazon.com):

Stalin's decision to put the new defense line right on the border looked unbelievably foolish to Zhukov. He couldn't say so bluntly, but he was shockingly audacious in expressing his doubts. (...) The troops had also been placed too close to the border, where they could be hit by a sudden German attack. One area of Pavlov's military district, the Belostok salient, looked especially vulnerable, as the Red Army could easily be trapped by the attacking Germans.

(...)

It had been a while since a general had dared to doubt the wisdom of Stalin's decisions. The remarks caused an uproar. Pavlov venomously said that in Zhukov's military district the fortifications were being built right on the border as well. Voroshilov angrily advised Zhukov to mind his own business

Preparing for defensive warfare, a country never put its fortifications right on the border and never placed its army in narrow strips of territory like the Belostok salient, where it could be easily strangled by the enemy.

Only a few people in the room knew that Stalin's real plan was to skip defensive war altogether and strike at Germany first.

Joseph Stalin had many skeletons in his closet, but in January 1941 the preemptive war plan was his best guarded secret. (...) In strategic terms, an attack on Hitler looked both feasible and desirable. (...) Stalin was sure that the Fuhrer was still focusing on Britain, leaving his eastern flank relatively weak. Only after Germany finished in the West, Stalin argued, would Hitler send the bulk of his troops to the Soviet Union's border. He didn't believe that Hitler would risk a war on two fronts, **and common sense supported that view**, since such strategic arrogance had cost Germany a catastrophic defeat in World War I

In the summer of 1940, under Shaposhnikov's guidance, Vasilevsky started work on the preemptive strike plan. (...) The main task they envisaged for the Red Army sounded heavily preemptive: "to defeat the German forces concentrating in East Prussia and around Warsaw".

Vasilevsky was told to rewrite the draft. (...) In October, under Stalin's pressure, Timoshenko and Meretskov cancelled the attack in the north altogether (into Prussia and Poland - AG) and agreed that the Red Army should strike in the south (Romania - AG). Now the Army was expected "to cut Germany off from the Balkans in order to deprive it of paramount economic resources(...)" (i.e. Romanian oil from Ploesti)

The generals knew that the vozhd (leader, or fuhrer, in Russian - AG), favored the south as the major strategic theatre(...). The document suggested striking from the Ukraine and defeating the Germans' main force in southern Poland. The Kiev military district, transformed into a group called the Southwestern Front, was to lead the attack, its troops striking at Krakow (in German occupied Poland -AG) In accordance with Zhukov's megalomaniacal tendencies, the southwestern Front was to send about 1 million men and 8,000 tanks into battle. Romania would also be invaded.

The air force needed more planes along the frontier as well. The plan also noted that it was time to start working on the rear, establishing new hospitals and depots.

No date was given for the attack, but the document suggested finalizing preparations in 1942.

And then Rudolf Hess flew a Me-110 to Britain. Hess was a deputy fuhrer. **What that meant, is that he was officially second in command to Hitler.**

I will let you think on that for a minute. The number 2 person in Nazi Germany secretly flies himself to the UK, which is at war with Germany...

Back for more? OK!

Stalin, the ever suspicious, believed that Hitler and Churchill were secretly negotiating a separate peace. In 1940 this was a very attractive proposition to the British government, if you remember your official schoolbook version of history. According to Pleshakov, Stalin "simply

couldn't believe that the second in command in the Nazi Party had just flown a plane to Britain to negotiate an alliance with London because he was insane." (pg 80). I am having my doubts too about that whole mysterious episode. But what happened officially was that Hitler declared Hess insane, the British imprisoned him, denied him any opportunity to give interviews, *drugged him up to make him insane*, then finally he was killed in Spandau prison long after the war.

Needless to say, Hess' (and possibly Hitler's) desperate plan to make peace with the United Kingdom failed.

Regardless, Pleshakov states that: "Hess' defection was a **pivotal** moment that spring. After it happened, Stalin decided to accelerate war preparations. Whatever precipitated Hess' flight, he was now no longer sure he had until the summer of 1942. The Red Army had to be able to move sooner than that." (pg 81).

The relocation of seven armies to the west wouldn't solve the problem of manpower. however, at least two more were needed. Also, many existing units were heavily understaffed. In May and June, 800,000 reservists were quietly drafted. All military schools were ordered to finish early that year so the young lieutenants could be sent to the west.

The accelerated buildup suggested that the army would be ready to strike by midsummer (1941 -AG). The seven armies were expected to be in place by July 10(...).

In total, almost 3 million soldiers were deployed between the Baltic and the Black Sea. **That figure included eleven police regiments charged with imposing order on the territories that were to be occupied.** (...) Soon the districts were to be renamed "Fronts", as the tentative war plan was envisioned. The existence of a Front unambiguously implied war. The Russian language had no word for a front line mega unit during peace time; only a fighting army could have such a thing.

By June 20, the Red Army Propaganda Directorate prepared a secret document. Pleshakov: "It was quite explicit, saying that it was useless to build defenses against the German juggernaut, as the example of a number of European countries had proved, and that the Soviet Union would therefore 'apply an offensive strategy' against Germany" (pg 84).

Mikhail Kalinin, president of USSR (a ceremonial function), addressed the graduates of the Lenin Military Academy on June 5, 1941: "War os the time when you can expand communism!"

AmericanGoy disclaimer:

The biggest obstacle to the truth about this portion of WW2 history are

two arguments:

- 1) The apologists for the Soviet Union, who for various reasons want to see that country as a liberator of people oppressed under Nazi tyranny, just like the Western Allies were, do not want this to come to light.
- 2) The historians, who throughout their lives unerringly wrote one version of history, until it became so ingrained that it was considered heresy in professional historical circles to question the narrative.

There is also the third argument, that by arguing that Hitler's attack on the Soviet Union was in effect a pre-emptive war, that that somehow whitewashes Hitler and Nazi Germany's crimes, and so they are anti semitic in nature.

Which argument is simply bullshit.

Any amateur or serious student of history has to realize, **that both** Nazi Germany and Stalin's (and his successors) Soviet Union were tyrannical dictatorships, which used secret police to keep dissent down, which both tortured their political opponents and random victims, which both imprisoned millions of people. **Both killed millions of people.**

It is true that this historical information is used by modern neo-nazis to somehow whitewash Hitler's actions. Well, it does not make it so to this amateur historian...

To me, rooting for one side or the other in the Soviet-Nazi war is akin to a situation when two gangs in your home city are fighting a turf war over drug territory. Which gang would you root for - the Bloods or the Crips?

Or perhaps you would realize that both of them are one and the same...

Must see online resources:

Icebreaker **FULL** book (since it is impossible to buy it in America - I did not place this work online though): [Icebreaker, by Viktor Suvorov, real name Rezun](#) At the link, look to the right, you can download this as a PDF document or text... Not that I am advocating an obviously illegal action of downloading a book unavailable in the market off the internet, and whoever placed the Icebreaker's full version in English on the web should be ashamed of themselves! Google preview book: [Pleshakov's Stalin's Folly](#)

Biography of the "historian troublemaker", nom de plume Viktor Suvorov:

[on the incredible internet resource Wikipedia.](#)

Bonus Material:

Haaretz article on [Mischa Shauli](#) :

Mischa Shauli sat at the National Archives in Washington, D.C., completely beside himself. It had been years since the first time he heard about the existence of a document said to prove that Stalin, not Hitler, bore the main responsibility for World War II, and for years he had searched for it with all his skills as a professional detective. Shauli's last position was as Commander Shauli, Representative of the Israel Police in Russia. Previous to that he had been head of the police fraud investigation unit for the Southern District.

A few years ago Shauli read "Icebreaker: Who Started the Second World War," by Bogdan Rozen. Rozen, who now lives in England, wrote it under the pseudonym of Viktor Suvorov. Shauli, impressed by the book, translated it into Hebrew and saw to its publication here.

From out of the sea of details, a coherent thesis emerges: Stalin dragged Hitler into war to force Europe into chaos and facilitate a communist revolution on the continent. According to Shauli, there is evidence to back up this theory, including a speech by Stalin himself as well as a report obtained by the U.S. Consulate in Prague. The report has been mentioned here and there over the years, but it has never been published, because no one knows where it is today.

Advertisement

Shauli, 59, believed that the definitive evidence was out there, hiding somewhere. He believed, and did not give up, repeatedly setting out to find it, going as far as Washington. No one is happier than he is today: The document is in his possession, and now the history of World War II may have to be rewritten: It was Stalin's fault.

The document, from October 1939, consists of three pages in English that purportedly reflect a dialogue in Moscow between a delegation from Czechoslovakia and a senior Soviet Foreign Ministry official. The Czechs tried to find out why the U.S.S.R. had signed the nonaggression treaty with Nazi Germany, the Molotov-Ribbentrop Pact of August 1939. A few days later the Germans invaded Poland, and World War II began.

The Soviet official, Alexandrov by name, explained to the Czech delegation that had the Soviet Union signed an agreement with the West, Hitler would not have dared to launch a war, and without that war there would have been no possibility of imposing communism in Europe. He also listed the benefits to the Soviet Union of the pact with Nazi Germany, and of the war.

The veracity of the document must be proved, and even if it turns out to be genuine, its significance is worthy of debate. Mischa Shauli is

continuing his investigation. **No, he said this week, he does not fear that shifting responsibility for the war from Hitler to Stalin "acquits" Hitler; he is responsible for other crimes.**

[WW2 Operation Barbarossa 1941 - the Real History version](#)

The trouble with historians is that they concentrate exclusively on the question of *what* happened, and never on the *why* it happened. This goes with a territory - that is what being a historian is all about; a sort of a journalist of the past, reporting the news as they happened, and not as they happen.

This leads to a problem, however.

Some facts get obscured by others, in effect they become forgotten, and so an unclear, muddled picture of the past emerges. Many historians, some because they are ordered to by their government, others because of nationalism, are inherently biased, and so pick and choose the reported facts. Many times, the original documents are missing, or kept stored in secret safes, never to be seen by the world's public as they would embarrass the country...

So a kind of a dogma, almost a religious cult, with all the heated passions, springs up about historical issues. Especially if it involves your country, which is pure as the driven snow, and would never, ever do bad (exception - if you lose the war, you are fucked, as it is commonly known that "the victors write the history books").

And so it was that the narrative, the evil Nazi Germany invaded the peaceful, innocent Soviet Union in World War 2 took hold.

Enter [Icebreaker by Viktor Suvorov](#).

In 1939, due to Stalin's political maneuvering, Hitler is made to act the part of the "Icebreaker of the Revolution", and entangles Europe (and the world) in a global, terrifying war. The Soviet Union is officially not involved.

In 1941, Soviet Union was finishing a gigantic national mobilization, and getting ready to attack its then ally, Hitler's Nazi Germany (and German allies).

Lets look at the history in some detail.

The revolution in 1917 which happened in Tsarist Russia, overthrew the Tsar put the Bolshevik party in power. The Bolsheviks were communists - the followers of the theoretical ramblings of Marx and Engels (German philosophers), advocating a "socioeconomic structure that promotes the establishment of a classless, stateless society based on common

ownership of the means of production" ([Wikipedia Communism entry](#)).

"Will it be possible for this revolution to take place in one country alone? No." - Friedrich Engels, *The Principles of Communism*, 1847

The Bolsheviks faithfully followed Marx and Engels' teachings on the need to change the world from the capitalist system into the communist one. Effectively, this meant a declaration of war by the Soviet Union against all non-communist countries in the world, to change their system of government.

"The bourgeoisie still rules over much of the world and so most Communist Parties and also the Communist International as the united party of the world revolutionary proletariat have to fight it." [Communist 3rd Congress: The Organisational Structure of the Communist Parties, the Methods and Content of Their Work, 1920](#).

The Third Communist Congress quotes:

"Before the revolution, and even after it, we thought: either revolution breaks out in the other countries, in the capitalistically more developed countries, immediately, or at least very quickly, or we must perish. In spite of this conviction, we did all we possibly could to preserve the Soviet system under all circumstances, come what may, **because we knew that we were not only working for ourselves, but also for the international revolution**" [1921, 3rd Congress theses](#)

"We Marxists do not belong to that category of people who are unqualified opponents of all war. We say: our aim is to achieve a socialist system of society, which, by eliminating the division of mankind into classes, by eliminating all exploitation of man by man and nation by nation, will inevitably eliminate the very possibility of war."

[Article in Pravda No. 93, written by Lenin](#)

The Bolshevik, later called the Communist Party of the Soviet Union - they saw themselves as the vanguard of the world revolution, because that was its *raison d'être* (its reason for existence): from [worldrevolution.org.uk](#): "Lenin stressed, as Karl Marx had done before him, that in order for Socialism to succeed, capitalists would need to be overthrown in several advanced countries too. He took the lead in organising a new world revolutionary party, the Communist (Third) International in 1919 after the betrayal of the Socialist (Second) International. The Third International bound revolutionary parties from all over the world in a common fight to repeat the successes of October 1917 and open the road to world socialism."

After Lenin came Stalin. And an abrupt change happened in the Soviet Union's policies.

[From the Wikipedia:](#) "Socialism in One Country was a thesis developed by Nikolai Bukharin in 1925 and adopted as state policy by Joseph Stalin. The thesis held that given the defeat of all communist revolutions in Europe from 1917–1921 except in Russia, the Soviet Union should begin to strengthen itself internally".

So, all the revolutions that sparked up in European countries in the 1920's were defeated. Again, same article: **"This theory was in an opposition to Lenin's beliefs that while a revolution may happen in one country, the final success of socialism in one country, especially in such a backward one as Russia, is impossible without proletarian revolutions in other, advanced countries of Western Europe"**.

So at first glance we have Stalin paying put to all talk of world revolution, and concentrating on internal national problems in the Soviet Union.

Seemingly.

I am a big fan of taking a look at what a politician is doing, as opposed to what he is saying (The old adage of "When do you know a politician is lying? When his lips are moving!"). So let's take a look at what was happening in the Soviet Union when Stalin ruled it with an iron hand. Lets...

1928: Stalin overturns the Lenin policy of the capitalism lite New Economic Program (NEP - google it yourself). In [this speech in 1928](#), Stalin explains himself: "The independence of our country cannot be upheld unless we have an adequate industrial basis for defence. And such an industrial basis cannot be created if our industry is not more highly developed technically".

What this lead to in practice, was that all the national resources went into heavy industry, such as iron mills, factories and the like. This left the ordinary people genuinely fucked. For example, the peasants experienced the joys of Collectivisation, which is a fancy word for the communist government thugs taking private farms away and putting all peasants into government run farms. And establishing quotas of grain and wheat production.

Failure to produce said quotas resulted in executions, and the policy itself resulted in mass starvation and cases of cannibalism. According to Robert Conquest in his book *The Harvest of Sorrow: Soviet Collectivisation and the Terror-Famine*, this policy resulted in 7 million deaths.

Effectively then, Collectivisation was modern day work slavery, similar to American South exploitation of blacks. The policy itself resulted in millions of victims. This is a good [webpage primer on the reality of communist rule](#)

. For a good scholarly study, read the preview of [The Economic Transformation of the Soviet Union by Davis, Harrison and Wheatcroft](#). Highly recommended, and free to you online.

But the policy itself was successful. It made the Soviet Union into an economic powerhouse, despite the millions of dead, starving or resettled victims in the Gulags. This was observed by (then) Colonel Heinz Guderian, as he visited the Kharkov Tank Factory in 1933 (the two socialist countries, Germany and Russia, were allies back then): it produced 22 tanks per day. This is pretty staggering, as Germany entered WW2 with just 3195 tanks... Or about 159 days of just one Soviet factory production. This is taken directly from Icebreaker and [Defense conversion Strategies by NATO ASI series](#).

By my standards, Stalin's industrialization was successful - it accomplished its goals to make the country into a modern military power. 22 tank produced per day in just one factory in one city... in 1933.

I will pause here and let you think on that for a second. Take a deep breath.

Ready? Moving on now...

Before there was WW2, there was the Molotov-Ribbentrop Pact. Read up the [bullshit version on Wikipedia](#), ponder them, and then come back here.

"For a long time, the primary motive of Stalin's sudden change of course was assumed to be the fear of German aggressive intentions." That was before Suvorov's Icebreaker book came out, that is.

First fact: Hitler's Nazi Germany and the Soviet Union attacked Poland together in 1939, as they agreed to in the pact. You can see some pictures of German and Soviet soldiers yukking it up in 1939 in Poland [here](#) and the actual documentary film [here](#) - the second link is recommended.

Second fact: Despite the Soviet Union being an ally of Hitler, and invading Poland together with Germany, the French and UK governments only declared war on Germany in 1939. They did not declare war on the second aggressor and Nazi ally, the Soviet Union...

I will let you think on that for a second. Take a deep breath, exhale...

OK, moving on.

So, to sum up the Molotov-Ribbentrop pact - Western Europe was at war with Nazi Germany, while the Soviet Union stayed aloof from the fracas. They were at peace.

But that is not the whole picture, far from the truth at all about that period of WW2. While Germany annexed the western part of Poland, the Soviet Union took over [the eastern part, totaling 201,015 km² and a population of 13.299 million.](#)

Hardly the action of a peace loving country.

In early 1940, Germany invaded Denmark and Norway. The peaceful and not involved in the raging world war Soviet Union, took over [Estonia, Latvia, and Lithuania.](#)

What we see here are actions of two allies, two predators, two animals of the same ilk. But in popular WW2 schoolbook history, we somehow learn only about how Hitler's Germany was the evil country and the sole source of WW2. The Molotov-Ribbentrop pact is explained as a play for time, to buy time to prepare by the Soviet Union for the inevitable German invasion.

I hope that the previous list of Soviet (and German) aggressions persuaded you that that view of WW2 history is bullshit.

If not, I will let Suvorov explain it all again:

In September 1939, the Soviet Union declared itself neutral and, during the 'pre-war period', seized territories with populations totalling 23 million people - not bad going for a neutral state.

The Red Army and the NKVD perpetrated fearful crimes in these captured territories. Soviet concentration camps were crammed with imprisoned soldiers and officers from a number of European countries. Officer prisoners, and not only the Poles, were shot in their thousands. This is not the action of a neutral state.

Here is a strange state of affairs. Germany attacked Poland, which means that Germany was the instigator of, and participant in, the European and then the World War. The Soviet Union did the same thing in the same month, but it does not judge itself to have been an instigator of the war. Nor does it consider itself even to have then been a participant in the war.

A Polish soldier killed in battle on Polish territory against the Red Army is considered a participant in World War II, as well as its victim, while the Soviet soldier who killed him is regarded as 'neutral'. If in the same battle a Soviet soldier is killed, then it is judged that he has been killed not in wartime but in peacetime - in the 'pre-war period'.

To further set the stage, I will let Suvorov quote Pravda articles from these days when Nazi Germany and Stalin's Soviet Union were allies: The foundations of the earth are trembling,' it wrote. 'The ground slips from under the feet of peoples and nations. Glows are afire in the sky and the thunder of guns shakes seas and continents. Powers and states are blown away just like chaff in the wind. How excellent it is, how extraordinarily wonderful, when the world is shaken to its very foundations, when powers perish and greatness falls.' (Pravda, 4 August 1940) 'Every such war brings us closer to that happy time when murders among the people will no longer happen. (Pravda, 18 August 1940)

The Soviet newspaper article writers were bursting with unbridled joy and happiness that the capitalists are killing each other.

The Soviet general Krivoschin, who in 1939 took part in the Nazi-Soviet victory parade in Brest, Poland, had this to say: "We have concluded a treaty with the Germans', he said, 'but this means nothing. Now is the most wonderful time to solve all world problems once and for all, and in a constructive way.' (Ratnaya ByV, Molodaya Gvardiya, 1962, p. 8)"

"Divide our enemies, meet the demands of each of them temporarily and then destroy them one at a time, giving them no opportunity to unite. (Pravda, 4 March 1941)"

This is what the outlook was of the hapless, unprepared for war Soviet Union, just trembling and cowering before the might of the mighty Wehrmacht.

I will pause again and let you process this information. Go to the restroom, grab a drink, make some popcorn, get some cookies... Ready?

Suvorov uses those two most dangerous weapons of all, *logic and common sense*.

He calmly states that, if the Soviet Union was interested in protecting its national territory, it would have kept Poland, Lithuania, Latvia and Estonia as buffer states, and warned Germany not to invade them. After all (using that dangerous common sense again) it would be very hard for Germany to invade the Soviet Union if they did not have a common border!

The apologists for the Soviet Union claim that the attack on Finland, the annexation of the Baltic countries (Estonia, Lithuania, Latvia) was all done to protect the Soviet Union. That is a strange, weird il-logic - I do not think that if any other country attacked and took over another country, and then claimed it was for self defense, that that argument would work.

But this is the Soviet Union's history, and that argument is discussed and agreed upon in serious scholarly books and articles.

Suvorov then continues with his second logic and common sense attack on the biggest historical lie of WW2 (second only to Pearl Harbor - that blog post upcoming). Having gotten a common border with Germany, what should have happened is that the Soviet Army should have built their own version of the Maginot Line - it should have mined the bridges on the border, built bunkers, tank traps, machine gun nests, etc etc.

Suvorov explains:

A country which is preparing its defence deploys its army deep inside its own territory, and not on its very frontier. The object is to prevent the enemy from destroying the main defending forces with one surprise attack. A defending side will normally build a security zone in the frontier areas in plenty of time; a zone where the terrain has been saturated with traps, engineered defences, obstacles and minefields. The defending side will deliberately avoid constructing anything related to industry or transport in this zone; nor will it keep any heavy military formations or large quantities of supplies there. On the contrary, timely preparations will have been made to blow up all bridges, tunnels and roads in this zone.

Once inside the security zone, the aggressor loses speed of movement, and his troops sustain losses before they even encounter the main forces of the defender. Only small but highly mobile detachments of the defending side operate in the security zone. These detachments spring ambushes, launch surprise attacks and then quickly withdraw to previously prepared positions. Light detachments create the impression that

they are the main force, compelling the aggressor to stop, deploy his forces and waste his shells on areas where there is nothing to hit. The light detachments, meanwhile, secretly withdraw to prepare new ambushes.

While the aggressor is waging an exhausting battle with the light detachments of the covering force, the main defending forces have time to prepare themselves to confront the aggressor from positions which favour defence.

So how does that work in practice, Mr. Suvorov?

(...)the Red Army itself created strong security zones on its own frontiers, particularly its western borders. Special government commissions inspected the country's western regions and determined which zones an enemy would find easiest to cross, and which would afford him most difficulty. Teams of bridge-protection guards, trained in demolition work, were made ready to blow up all the bridges in the

western regions. The 60-metre long railway bridge at Olev, for example, could have been blown up by the duplicated explosion system in two and a half minutes. (I. Starinov, *Miny Zhdut Svoego Chasa*, Moscow Voenizdat 1964, p. 24)

Heavy pipe-lines, depots, water pumps, water towers, high embankments and deep cuttings were all prepared to be blown up. (Ibid, p. 18) By the end of 1929, 60 teams of demolition sappers, totalling 1,400 men, had been trained in the Kiev Military District alone. These had at their disposal '1,640 fully prepared sophisticated charges and tens of thousands of safety-fuse detonator sets, which were ready literally for instant use.' (Ibid, p. 22) Similar activity was also going on in other military districts.

In addition to the teams of demolition sappers which had been set up in the western regions of the country, railway-blocking battalions were formed. One of their tasks was to destroy the main railway junctions in the event of a retreat and to create defence obstacles on the main arterial routes by destroying roads and laying delayed-action land mines lest the enemy should try to rebuild the roads. There were four such battalions in the Ukraine in 1932. (Ibid, p. 175)

Railway points crossings, communications equipment, telegraph wires and in some cases even the rails were got ready to be removed. (M. Tukhachevsky, *Izbrannye Proizvedeniya*, Moscow Voenizdat 1964, Vol. i pp. 65-67)

The Soviet security zone underwent continuous improvements. The number of targets prepared for demolition steadily grew. New defence obstacles were created: forest barriers; artificial reservoirs in front of defensive constructions; preparations were even made to flood some areas.

The Soviet Union then declared war on Finland and experienced a security zone on its own attacking troops.

The failures of the Red Army on this occasion were not simply the results of miscalculations by the Soviet command. More important was the fact that the Finnish Army was prepared for defence, and ready to make sacrifices. The Finns had erected their security zone in front of their main line of defence. This zone - some 40-60 kilometres deep (*Sovetskaya Voennaya Entsiklopediya*, Vol. 6, p. 504) - was strewn with minefields and defence obstacles. Snipers, sappers and light mobile detachments were extremely active.

Suvorov continues the narrative:

All the Soviet commanders who fought there expressed their admiration of the Finnish security zone. Foremost among them was K. Meretskov, who commanded the 1st Army. (Na Sluzhbe Narodu, Moscow IPL 1968, p. 184) After he had finally overcome the Finnish security zone and had assessed its worth, Meretskov was appointed Chief of the General Staff. So how did he make use of his experience in order to reinforce the Soviet security zone which had been set up along the Soviet Union's western frontiers?

Meretskov ordered that:

1. The security zone which had previously been constructed along the Soviet Union's western frontiers should be dismantled, the teams of demolition sappers disbanded, the explosive charges removed, the mines rendered harmless, and the defence obstacles razed to the ground;
2. No security zone should be set up in the new lands;
3. The main forces of the Red Army should be moved right up to the frontiers, without a security zone to protect them;
4. The strategic resources of the Red Army should be brought from the heart of the country and concentrated directly on the frontier;
5. A vast works programme should begin at once to build a network of roads and airfields in western Byelorussia and in the western Ukraine: single-lane roads were to be made into dual-lane roads, the capacity of the roads was to be increased; and new roads leading directly to the German border were to be built.

Come again?

That does not plan like a defensive zone to act as a buffer between Germany and the Soviet Union. That sounds like a country that is expecting an invasion of... tourists, not enemy troops. Why was this enormous programme of public works undertaken, why did the Soviet troops move towards the border when the defensive obstacles were "razed to the ground"?

Perhaps Stalin was counting on an already existing fortification, already built. Perhaps... The so called Stalin Line did indeed exist.

In the 1930s, thirteen fortified regions, or URs, were built along the Soviet Union's western frontier, in a strip of territory which was unofficially called the Stalin Line.

The basic element of the fortified regions was the DOT, or permanent fire position. In its issue of 25 February 1983, the newspaper Red Star gave a description of DOT No. 112 in the 53rd UR, situated in the Mogilev-Podolsk region. This was one of the completely standard DOTs in the Stalin Line.

It consisted of complex tunnelled fortification defences, which contained communication trenches, caponiers, compartments and filtration systems.

It also had armouries, ammunition stores, food supplies, a medical unit, a mess room, water supply (which incidentally is still functioning), a recreation and reading room, and observation and command posts. The armament of the DOT consisted of machine-gun positions with three firing embrasures. In these posts there were three 'maxims' mounted on special turrets and two single-gun caponiers with a cannon in each one.

(...)

Colonel-General A. I. Shebunin, another participant in that mighty work of construction, tells us that in the Proskurov UR alone, more than one thousand reinforced concrete defence-works were constructed in just three years.

OK, so there was an already existing "Maginot Line" in the Soviet Union.

Curious thing happened though:

"In Autumn 1939, however, when World War II began and a common frontier with Germany was established, all construction work on the Stalin Line was stopped. (V. Anfilov: Bessmertnyi Podvig, Moscow Nauka 1971, p. 35)"

"The garrisons in the fortified regions of the Stalin Line were first reduced in size and then disbanded completely. Soviet factories stopped producing armament and special equipment destined for fortification installations. The existing fortified regions were dismantled, and their armament, ammunition and all observation, communications and fire-control equipment were put into storage. (VIZH 1961 No. 9, p. 120)"

I do not know how future historians will explain this crime against our people. Present-day historians pass over this event in complete silence, and I do not know why. The Soviet government fleeced its people of many billions of roubles (no less than 120 billion, according to my calculations) in order to build fortifications, impregnable to any enemy, along the entire western frontier, from sea to sea, from the grey Baltic to the azure Black Sea. Yet just before war broke out, in spring 1941, powerful explosions thundered along the 1,200-kilometre-long stretch of fortifications. Strong double and single caponiers built of reinforced concrete, firing positions with one, two and three embrasures, command posts, observation posts, and tens of thousands of permanent defensive installations were all blown up on Stalin's personal orders. (Major-General P. G. Grigorenko, VPodpol'eMozhno Vstretit' Tol'ko Krysa, New York 1981, p. 141)

Come again?

Summing up - the old fortification on the old Soviet frontier was dismantled, its troop levels reduced, its armament put into storage. The

new frontier's defense zone was not built to compensate.

Besides, when defending yourself, two Maginot Lines are better than one, so even if you *did* plan to build a new Stalin Line on the new German-Soviet border, why in the world would you destroy the old one?

That common sense and logic again... Dangerous weapons indeed.

Instead of making bunkers and planting mines, the Soviet Army in 1939-1941 was busy training paratroopers. There were 10 Airborne Corps created pre war and during initial days of Barbarossa in 1939-1941 ([quoted figures from soldat.ru forum](#))

In the course of the manoeuvres held in Kiev in 1935, a parachute assault force of 1,200 men was dropped, immediately followed by an air-landed assault force of 2,500 men armed with heavy weaponry including artillery, armoured cars and tanks.

In Byelorussia in 1936, in the course of practising the same offensive theme, a parachute assault force of 1,800 men was dropped. They were followed by an air-landed assault force of 5,700 men armed with heavy weaponry. In the same year, the full complement of the 84th Rifle Division made an air-landed assault in the course of offensive manoeuvres in the Moscow Military Division.

Common sense and logic: paratroopers are not used in defensive, only in an offensive.

Need a break? No? Continuing...

Among the many defensive systems which the Soviet Union possessed was the Dnieper Naval Flotilla.
(...)

The formidable barrier formed by the Dnieper, the bridges ready to be detonated, and the river Flotilla working in cooperation with the field troops, artillery and air force, could have safely barred the way to the industrial regions of the southern Ukraine and the Soviet bases on the Black Sea. The German Blitzkrieg could have been stopped on the river-banks, or at least held up there for several months.

Instead of one defensive flotilla, Stalin then created two new ones, the Danube Flotilla and the Pinsk Flotilla. The Soviet Danube Flotilla was formed before the Soviet Union acquired an outlet to the Danube. In the course of Zhukov's 'liberation campaign' in the Romanian frontier regions, Stalin took Bukovina and Bessarabia from Romania. Right at the mouth of the Danube, a sector of the eastern bank of the river, some dozens of kilometres long, passed into the possession of the Soviet Union. The

Danube Flotilla, which had already been set up in expectation of this event, was moved there immediately

The Danube Naval Flotilla included about 70 naval river vessels and launches, sub-units of the fighter air force, and anti-aircraft and shore artillery. The conditions where the base had to be built were frightful. The Soviet bank of the Danube Delta was barren and exposed. The vessels had to moor at open berths, with Romanian troops sometimes only 300 metres away.

In the event of a defensive war, the entire Danube Flotilla would have fallen into a trap the moment hostilities began. The enemy could simply rake the Soviet vessels with machine-gun fire, preventing them from raising anchor and casting off. In a defensive war, moreover, the Danube Naval Flotilla would have had no useful function. Given its location, there were simply no defensive tasks for it to fulfil. The Danube Delta consists of hundreds of lakes, impassable swamps and hundreds of square kilometres of reed marshes. It is the last place through which an enemy would choose to attack the Soviet Union.

There was only one way to explain the siting of the Danube Flotilla; its purpose was to carry out combat operations upstream while Red Army troops were making a general advance. If you gather 70 river vessels in the delta of a great river, they have nowhere to go except upstream. This meant that they would have to operate on the territory of Romania, Bulgaria, Yugoslavia, Hungary, Czechoslovakia, Austria and Germany.

The Danube Flotilla was of no use to anyone in a defensive war, and it was condemned to be destroyed immediately in its open moorings on a bank raked by enemy gunfire. In an offensive war, however, the Danube Flotilla would be a mortal danger to Germany. It only had to move 130 kilometres upstream for the strategic bridge at Chernavada to come under fire from its guns. That in its turn would mean that the flow of oil from Ploesti to the port of Constanza would be cut off. Another 200 kilometres upstream and the entire German war machine would come to a halt simply because German tanks, aircraft and submarines would have been left without fuel.

Of course, the apologists for their version of history will tell us that everything that Suvorov writes about the flotilla was defensive in nature.

Which does not explain how, during the first day of the Axis invasion on the Soviet Union,

As soon as they learnt that the war had begun, the Soviet commanders put the finishing touches to their preparations to launch an assault landing operation. The action to be taken by the Soviet Flotilla commanders, and also by the commanders of the 14th Rifle Corps, whose divisions were

concentrated in the Danube Delta area, and by the commanders of the 79th Frontier Detachment of the NKVD, had been previously planned and worked out with great care. On 25 June 1941, the Danube Flotilla vessels, under cover of fire from the shore batteries and artillery of the 14th Rifle Corps, landed reconnaissance and sabotage sub-units of the NKVD on the Romanian bank. Regiments of the 51st Rifle Division of the 14th Rifle Corps were next to be landed. Members of the Soviet assault landing force acted swiftly and decisively. A complex operation involving river vessels, aircraft, field, shore and shipborne artillery, and sub-units of the Red Army and the NKVD had been successfully executed with clockwork precision. Everything had been prepared, coordinated, agreed and checked many times over. On the morning of 26 June 1941, the red flag was hoisted over the cathedral in the Romanian town of Kilia.

Kilia was roughly 130 kilometres from Ploesti, where the Romanian oilfields were. The oilfields which supplied the German Army in WW2 in oil, which were necessary to Nazi Germany's survival... Which was understood by all the allies, as the US Air Force [bombed it repeatedly](#). Germany got most of its oil from Romania (Ploesti refineries), and synthetic oil production - see [google answers](#). For the truly dedicated (like me!) nerds, look up [The Role of Synthetic Fuel In World War II Germany](#). I disagree with the author that "Yet a High Command study in May of 1941 noted that with monthly military requirements for 7.25 million barrels and imports and home production of only 5.35 million barrels, German stocks would be exhausted by August 1941. The 26 percent shortfall could only be made up with petroleum from Russia. The need to provide the lacking 1.9 million barrels per month and the urgency to gain possession of the Russian oil fields in the Caucasus mountains, together with Ukrainian grain and Donetsk coal, were thus prime elements in the German decision to invade the Soviet Union in June 1941", as it is bullshit...

And here is why:

The Soviet Union provided its ally Nazi Germany with 900,000 tons of mineral oil ([yale.com article](#)), per the Molotov-Ribbentrop agreement.

OK, now we are getting into the nitty gritty. Take a break, get a drink of your favorite alcoholic beverage, and come back.

Exactly **why** did Germany invade the Soviet Union in WW2?

The pro-Soviet version of history postulates various explanations:

- 1) Germany did it for lebensraum, per the incoherent and rambling 'Mein Kampf'
- 2) Germany did it for economic reasons - to grab oil, coal located on Soviet territory
- 3) Hitler was craaaaaaaazy

Reason 2 is a no go, as the Soviet Union supplied Germany with everything it needed to kill Englishmen and their allies: oil, iron, food stuffs.

Reason 1 stipulates that Hitler was insane, which leads into reason 3. Hooray!

The logic of "official" WW2 historians is.... strange.

I already quoted Suvorov on how the Danube flotilla behaved during the first day of war. How did the rest of the Soviet Army behave?

John Erickson's *The Road to Stalingrad*: "Stalin agreed to a second directive being issued, Directive nr. 2(...) Signed by Zhukov as Chief of the General Staff, the directive stipulated 'active offensive operations'. (pg. 124)". This went over the Red Army communication system on 22 June, 07:15 hours.

Directive nr. 3, prescribed "nothing less than all three Soviet Fronts (Soviet Army Groups on the German frontier) taking the offensive" This directive went out on the Red Army wireless on 22 June, 21:15 (pg 132).

Suvorov again:

In the first hours following the beginning of the German invasion, the Red Army kept on trying to go over to the offensive. Modern textbooks call what the Red Army was doing counter-strikes and counter-offensives. But it was pure improvisation. The problem of counter-strikes had never been worked through in any pre-war exercises, nor indeed had it ever been considered in theoretical terms: 'the subject of counter-offensive... had never been raised before the Great Motherland War'. (IVOSS (the official history of the 'Great Patriotic War'), Vol. i, p. 441)

Operations of the Soviet fleets in the first minutes, hours and days of the war show sufficiently clearly that they did have plans, but that these were not plans for defence. On 22 June 1941, Soviet submarines of the Black Sea Fleet immediately put to sea and headed for the coasts of Romania, Bulgaria and Turkey. The same day submarines of the Baltic Fleet set sail for the coasts of Germany, with a mission to 'sink all enemy ships and vessels, in accordance with the rights of unrestricted submarine warfare'. (Order of Officer Commanding Baltic Fleet, 22 June 1941, Plot v Velikoi Otechestvennoi Voine, Moscow Nauka 1980, p. 279)

Beginning on 22 June, the air arm of the Black Sea Fleet carried out active combat operations in support of the Danube Naval Flotilla with the objective of opening a way upstream for the flotilla. On 25—26 June,

surface warships of the Black Sea Fleet appeared off the Romanian port of Constanza and began an intensive artillery bombardment with the obvious intention of making a naval assault landing. At the same time the Danube Naval Flotilla began to carry out assault landing operations in the Danube Delta.

On 22 June, the garrison at the naval base at Hanko, on Finnish territory, instead of going over to a stonewall defence, initiated some sustained assault landing operations, and held nineteen Finnish islands for several days. On 25 June, in spite of the enormous losses which the Soviet Air Forces had sustained in the first hours of the war, 487 aircraft belonging to the Baltic and Arctic Fleets launched a surprise strike at Finnish airfields. Again in spite of these enormous losses, the Soviet air forces conducted themselves with exceptional valour and aggression. On 22 June the 1st Air Corps made a concentrated raid on military objectives in Königsberg.

None of this was improvisation. At 6.44 am on 22 June the Soviet Air Force was given the mission of operating in accordance with its plans, and for a few days it tried to do this. On 26 June, the 4th Air Corps began bombing raids on the Ploesti oilfields in Romania.

On 22 June 1941, the 41st Rifle Division of the 6th Army's 6th Rifle Corps, without waiting for orders from above, crossed the state frontier near Raval-Russkaya. That same morning, and without waiting for orders from Moscow, Colonel-General F. I. Kuznetsov, officer commanding the North-West Front, ordered his troops to launch an attack towards Tilsit in East Prussia. This decision came as no surprise either to the headquarters staff of the North-West Front or to the officers commanding the armies and their staffs, for a version of the attack on Tilsit had been played out in headquarters exercises held a few days previously, 'and it was very familiar to the commanders of the formations and their headquarters'. (Bor'ba za Sovetskuyu Pribaltiku, Eesti Raamat, Tallinn 1980, Vol. i, p. 67)

the commanders at tactical level were not entitled to know what their tasks would be, but in the senior headquarters, these tasks had been exactly defined and formulated, placed under seal in secret envelopes, and kept in the safe in every headquarters, up to and including the level of battalion. For instance, the Reconnaissance Battalion of the 27th Rifle Division, concentrated close to the frontier near the town of Augustow, was preparing to carry out combat reconnaissance in the direction of Suwalki. (Arkhiv MO SSSR, Archive 181, list 1631, item i, p. 128) The task of the Reconnaissance Battalion was to ensure the swift

advance of the entire 27th Division from near Augustow to Suwalki.

So using our two dangerous weapons - logic and common sense - let us attack now.

If the Soviet Union had no plans which the Army units could use in the event of an enemy attack on the country, if the military forces, when the enemy attacked, immediately went over the offensive themselves, when they were told by the Chief of Staff to attack, all Fronts, attack! ... What does that tell us the plans of the Soviet Union were in WW2?

End Game

Constantine Pleshakov, freely available in the USA, and at [Amazon.com](https://www.amazon.com):

Stalin's decision to put the new defense line right on the border looked unbelievably foolish to Zhukov. He couldn't say so bluntly, but he was shockingly audacious in expressing his doubts. (...) The troops had also been placed too close to the border, where they could be hit by a sudden German attack. One area of Pavlov's military district, the Belostok salient, looked especially vulnerable, as the Red Army could easily be trapped by the attacking Germans.

(...)

It had been a while since a general had dared to doubt the wisdom of Stalin's decisions. The remarks caused an uproar. Pavlov venomously said that in Zhukov's military district the fortifications were being built right on the border as well. Voroshilov angrily advised Zhukov to mind his own business

Preparing for defensive warfare, a country never put its fortifications right on the border and never placed its army in narrow strips of territory like the Belostok salient, where it could be easily strangled by the enemy.

Only a few people in the room knew that Stalin's real plan was to skip defensive war altogether and strike at Germany first.

Joseph Stalin had many skeletons in his closet, but in January 1941 the preemptive war plan was his best guarded secret. (...) In strategic terms, an attack on Hitler looked both feasible and desirable. (...) Stalin was sure that the Fuhrer was still focusing on Britain, leaving his eastern flank relatively weak. Only after Germany finished in the West, Stalin argued, would Hitler send the bulk of his troops to the Soviet Union's border. He didn't believe that Hitler would risk a war on two fronts, **and common sense supported that view**, since such strategic arrogance had cost Germany a catastrophic defeat in World War I

In the summer of 1940, under Shaposhnikov's guidance, Vasilevsky started work on the preemptive strike plan. (...) The main task they envisaged for the Red Army sounded heavily preemptive: "to defeat the German forces concentrating in East Prussia and around Warsaw".

Vasilevsky was told to rewrite the draft. (...) In October, under Stalin's pressure, Timoshenko and Meretskov cancelled the attack in the north altogether (into Prussia and Poland - AG) and agreed that the Red Army should strike in the south (Romania - AG). Now the Army was expected "to cut Germany off from the Balkans in order to deprive it of paramount economic resources(...)" (i.e. Romanian oil from Ploesti)

The generals knew that the vozhd (leader, or fuhrer, in Russian - AG), favored the south as the major strategic theatre(...). The document suggested striking from the Ukraine and defeating the Germans' main force in southern Poland. The Kiev military district, transformed into a group called the Southwestern Front, was to lead the attack, its troops striking at Krakow (in German occupied Poland -AG) In accordance with Zhukov's megalomaniacal tendencies, the southwestern Front was to send about 1 million men and 8,000 tanks into battle. Romania would also be invaded.

The air force needed more planes along the frontier as well. The plan also noted that it was time to start working on the rear, establishing new hospitals and depots.

No date was given for the attack, but the document suggested finalizing preparations in 1942.

And then Rudolf Hess flew a Me-110 to Britain. Hess was a deputy fuhrer. **What that meant, is that he was officially second in command to Hitler.**

I will let you think on that for a minute. The number 2 person in Nazi Germany secretly flies himself to the UK, which is at war with Germany...

Back for more? OK!

Stalin, the ever suspicious, believed that Hitler and Churchill were secretly negotiating a separate peace. In 1940 this was a very attractive proposition to the British government, if you remember your official schoolbook version of history. According to Pleshakov, Stalin "simply

couldn't believe that the second in command in the Nazi Party had just flown a plane to Britain to negotiate an alliance with London because he was insane." (pg 80). I am having my doubts too about that whole mysterious episode. But what happened officially was that Hitler declared Hess insane, the British imprisoned him, denied him any opportunity to give interviews, *drugged him up to make him insane*, then finally he was killed in Spandau prison long after the war.

Needless to say, Hess' (and possibly Hitler's) desperate plan to make peace with the United Kingdom failed.

Regardless, Pleshakov states that: "Hess' defection was a **pivotal** moment that spring. After it happened, Stalin decided to accelerate war preparations. Whatever precipitated Hess' flight, he was now no longer sure he had until the summer of 1942. The Red Army had to be able to move sooner than that." (pg 81).

The relocation of seven armies to the west wouldn't solve the problem of manpower. however, at least two more were needed. Also, many existing units were heavily understaffed. In May and June, 800,000 reservists were quietly drafted. All military schools were ordered to finish early that year so the young lieutenants could be sent to the west.

The accelerated buildup suggested that the army would be ready to strike by midsummer (1941 -AG). The seven armies were expected to be in place by July 10(...).

In total, almost 3 million soldiers were deployed between the Baltic and the Black Sea. **That figure included eleven police regiments charged with imposing order on the territories that were to be occupied.** (...) Soon the districts were to be renamed "Fronts", as the tentative war plan was envisioned. The existence of a Front unambiguously implied war. The Russian language had no word for a front line mega unit during peace time; only a fighting army could have such a thing.

By June 20, the Red Army Propaganda Directorate prepared a secret document. Pleshakov: "It was quite explicit, saying that it was useless to build defenses against the German juggernaut, as the example of a number of European countries had proved, and that the Soviet Union would therefore 'apply an offensive strategy' against Germany" (pg 84).

Mikhail Kalinin, president of USSR (a ceremonial function), addressed the graduates of the Lenin Military Academy on June 5, 1941: "War is the time when you can expand communism!"

AmericanGoy disclaimer:

The biggest obstacle to the truth about this portion of WW2 history are

two arguments:

- 1) The apologists for the Soviet Union, who for various reasons want to see that country as a liberator of people oppressed under Nazi tyranny, just like the Western Allies were, do not want this to come to light.
- 2) The historians, who throughout their lives unerringly wrote one version of history, until it became so ingrained that it was considered heresy in professional historical circles to question the narrative.

There is also the third argument, that by arguing that Hitler's attack on the Soviet Union was in effect a pre-emptive war, that that somehow whitewashes Hitler and Nazi Germany's crimes, and so they are anti semitic in nature.

Which argument is simply bullshit.

Any amateur or serious student of history has to realize, **that both** Nazi Germany and Stalin's (and his successors) Soviet Union were tyrannical dictatorships, which used secret police to keep dissent down, which both tortured their political opponents and random victims, which both imprisoned millions of people. **Both killed millions of people.**

It is true that this historical information is used by modern neo-nazis to somehow whitewash Hitler's actions. Well, it does not make it so to this amateur historian...

To me, rooting for one side or the other in the Soviet-Nazi war is akin to a situation when two gangs in your home city are fighting a turf war over drug territory. Which gang would you root for - the Bloods or the Crips?

Or perhaps you would realize that both of them are one and the same...

Must see online resources:

Icebreaker **FULL** book (since it is impossible to buy it in America - I did not place this work online though): [Icebreaker, by Viktor Suvorov, real name Rezun](#) At the link, look to the right, you can download this as a PDF document or text... Not that I am advocating an obviously illegal action of downloading a book unavailable in the market off the internet, and whoever placed the Icebreaker's full version in English on the web should be ashamed of themselves! Harrumph, my good sir (or madam)! Harrumph I say!

Biography of the "historian troublemaker", nom de plume Viktor Suvorov:

[on the incredible internet resource Wikipedia.](#)

Bonus Material:

Haaretz article on [Mischa Shauli](#) :

Mischa Shauli sat at the National Archives in Washington, D.C., completely beside himself. It had been years since the first time he heard about the existence of a document said to prove that Stalin, not Hitler, bore the main responsibility for World War II, and for years he had searched for it with all his skills as a professional detective. Shauli's last position was as Commander Shauli, Representative of the Israel Police in Russia. Previous to that he had been head of the police fraud investigation unit for the Southern District.

A few years ago Shauli read "Icebreaker: Who Started the Second World War," by Bogdan Rozen. Rozen, who now lives in England, wrote it under the pseudonym of Viktor Suvorov. Shauli, impressed by the book, translated it into Hebrew and saw to its publication here.

From out of the sea of details, a coherent thesis emerges: Stalin dragged Hitler into war to force Europe into chaos and facilitate a communist revolution on the continent. According to Shauli, there is evidence to back up this theory, including a speech by Stalin himself as well as a report obtained by the U.S. Consulate in Prague. The report has been mentioned here and there over the years, but it has never been published, because no one knows where it is today.

Advertisement

Shauli, 59, believed that the definitive evidence was out there, hiding somewhere. He believed, and did not give up, repeatedly setting out to find it, going as far as Washington. No one is happier than he is today: The document is in his possession, and now the history of World War II may have to be rewritten: It was Stalin's fault.

The document, from October 1939, consists of three pages in English that purportedly reflect a dialogue in Moscow between a delegation from Czechoslovakia and a senior Soviet Foreign Ministry official. The Czechs tried to find out why the U.S.S.R. had signed the nonaggression treaty with Nazi Germany, the Molotov-Ribbentrop Pact of August 1939. A few days later the Germans invaded Poland, and World War II began.

The Soviet official, Alexandrov by name, explained to the Czech delegation that had the Soviet Union signed an agreement with the West, Hitler would not have dared to launch a war, and without that war there would have been no possibility of imposing communism in Europe. He also listed the benefits to the Soviet Union of the pact with Nazi Germany, and of the war.

The veracity of the document must be proved, and even if it turns out to be genuine, its significance is worthy of debate. Mischa Shauli is

continuing his investigation. **No, he said this week, he does not fear that shifting responsibility for the war from Hitler to Stalin "acquits" Hitler; he is responsible for other crimes.**

Spetsnaz.

The Inside Story of the Soviet Special Forces

by Viktor Suvorov.

To Natasha and Alexander

Chapter 1. Spades and Men

Every infantryman in the Soviet Army carries with him a small spade. When he is given the order to halt he immediately lies flat and starts to dig a hole in the ground beside him. In three minutes he will have dug a little trench 15 centimetres deep, in which he can lie stretched out flat, so that bullets can whistle harmlessly over his head. The earth he has dug out forms a breastwork in front and at the side to act as an additional cover. If a tank drives over such a trench the soldier has a 50% chance that it will do him no harm. At any moment the soldier may be ordered to advance again and, shouting at the top of his voice, will rush ahead. If he is not ordered to advance, he digs in deeper and deeper. At first his trench can be used for firing in the lying position. Later it becomes a trench from which to fire in the kneeling position, and later still, when it is 110 centimetres deep, it can be used for firing in the standing position. The earth that has been dug out protects the soldier from bullets and fragments. He makes an embrasure in this breastwork into which he positions the barrel

of his gun. In the absence of any further commands he continues to work on his trench. He camouflages it. He starts to dig a trench to connect with his comrades to the left of him. He always digs from right to left, and in a few hours the unit has a trench linking all the riflemen's trenches together. The unit's trenches are linked with the trenches of other units. Dug-outs are built and communication trenches are added at the rear. The trenches are made deeper, covered over, camouflaged and reinforced. Then, suddenly, the order to advance comes again. The soldier emerges, shouting and swearing as loudly as he can.

The infantryman uses the same spade for digging graves for his fallen comrades. If he doesn't have an axe to hand he uses the spade to chop his bread when it is frozen hard as granite. He uses it as a paddle as he floats across wide rivers on a telegraph pole under enemy fire. And when he gets the order to halt, he again builds his impregnable fortress around himself. He knows how to dig the earth efficiently. He builds his fortress exactly as it should be. The spade is not just an instrument for digging: it can also be used for measuring. It is 50 centimetres long. Two spade lengths are a metre. The blade is 15 centimetres wide and 18 centimetres long. With these measurements in mind the soldier can measure anything he wishes.

The infantry spade does not have a folding handle, and this is a very important feature. It has to be a single monolithic object. All three of its edges are as sharp as a knife. It is painted with a green matt paint so as not to reflect the strong sunlight.

The spade is not only a tool and a measure. It is also a guarantee of the steadfastness of the infantry in the most difficult situations. If the infantry have a few hours to dig themselves in, it could take years to get them out of their holes and trenches, whatever modern weapons are used against them.

In this book we are not talking about the infantry but about soldiers belonging to other units, known as *spetsnaz*. These soldiers never dig trenches; in fact they never take up defensive positions. They either launch a sudden attack on an enemy or, if they meet with resistance or superior enemy forces, they disappear as quickly as they appeared and attack the enemy again where and when the enemy least expects them to appear.

Surprisingly, the *spetsnaz* soldiers also carry the little infantry spades. Why do they need them? It is practically impossible to describe in words how they use their spades. You really have to see what they do with them. In the hands of a *spetsnaz* soldier the spade is a terrible noiseless weapon and every member of *spetsnaz* gets much more training in the use of his spade than does the infantryman. The first thing he has to teach himself is precision: to split little slivers of wood with the edge of the spade or to cut off the neck of a bottle so that the bottle remains whole. He has to learn to love his spade and have faith in its accuracy. To do that he places his hand on the stump of a tree with the fingers spread out and takes a big swing at the stump with his right hand using the edge of the spade. Once he has learnt to use the spade well and truly as an axe he is taught more complicated things. The little spade can be used in hand-to-hand fighting against blows from a bayonet, a knife, a fist or another spade. A soldier armed with nothing but the spade is shut in a room without windows along

with a mad dog, which makes for an interesting contest. Finally a soldier is taught to throw the spade as accurately as he would use a sword or a battle-axe. It is a wonderful weapon for throwing, a single, well-balanced object, whose 32-centimetre handle acts as a lever for throwing. As it spins in flight it gives the spade accuracy and thrust. It becomes a terrifying weapon. If it lands in a tree it is not so easy to pull out again. Far more serious is it if it hits someone's skull, although *spetsnaz* members usually do not aim at the enemy's face but at his back. He will rarely see the blade coming, before it lands in the back of his neck or between his shoulder blades, smashing the bones.

The *spetsnaz* soldier loves his spade. He has more faith in its reliability and accuracy than he has in his Kalashnikov automatic. An interesting psychological detail has been observed in the kind of hand-to-hand confrontations which are the stock in trade of *spetsnaz*. If a soldier fires at an enemy armed with an automatic, the enemy also shoots at him. But if he doesn't fire at the enemy but throws a spade at him instead, the enemy simply drops his gun and jumps to one side.

This is a book about people who throw spades and about soldiers who work with spades more surely and more accurately than they do with spoons at a table. They do, of course, have other weapons besides their spades.

Chapter 2. *Spetsnaz* and the GRU

It is impossible to translate the Russian word *razvedka* precisely into any foreign language. It is usually rendered as 'reconnaissance' or 'spying' or 'intelligence gathering'. A fuller explanation of the word is that it describes any means and any actions aimed at obtaining information about an enemy, analysing it and understanding it properly.

Every Soviet military headquarters has its own machinery for gathering and analysing information about the enemy. The information thus collected and analysed about the enemy is passed on to other headquarters, higher up, lower down and on the same level, and each headquarters in turn receives information about the enemy not only from its own sources but also from the other headquarters.

If some military unit should be defeated in battle through its ignorance of the enemy, the commanding officer and his chief of staff have no right to blame the fact that they were not well enough informed about the enemy. The most important task for every commander and chief of staff is that, without waiting for information to arrive from elsewhere, they must organise their own sources of information about the enemy and warn their own forces and their superior headquarters of any danger that is threatened.

Spetsnaz is one of the forms of Soviet military *razvedka* which occupies a place somewhere between reconnaissance and intelligence.

It is the name given to the shock troops of *razvedka* in which there are combined elements of espionage, terrorism and large-scale partisan operations. In personal terms, this covers a very diverse range of people: secret agents recruited by Soviet military *razvedka* among foreigners for carrying out espionage and terrorist operations; professional units composed of the country's best sportsmen; and units made up of ordinary but carefully

selected and well trained soldiers. The higher the level of a given headquarters is, the more *spetsnaz* units it has at its disposal and the more professionals there are among the *spetsnaz* troops.

The term *spetsnaz* is a composite word made up from *spetsialnoye nakhacheniyeye*, meaning 'special purpose'. The name is well chosen. *Spetsnaz* differs from other forms of *razvedka* in that it not only seeks and finds important enemy targets, but in the majority of cases attacks and destroys them.

Spetsnaz has a long history, in which there have been periods of success and periods of decline. After the Second World War *spetsnaz* was in the doldrums, but from the mid-1950s a new era in the history of the organisation began with the West's new deployment of tactical nuclear weapons. This development created for the Soviet Army, which had always prepared itself, and still does, only for 'liberation' wars on foreign territory, a practically insuperable barrier. Soviet strategy could continue along the same lines only if the means could be found to remove Western tactical nuclear weapons from the path of the Soviet troops, without at the same time turning the enemy's territory into a nuclear desert.

The destruction of the tactical nuclear weapons which render Soviet aggression impossible or pointless could be carried out only if the whereabouts of all, or at least the majority, of the enemy's tactical nuclear weapons were established. But this in itself presented a tremendous problem. It is very easy to conceal tactical missiles, aircraft and nuclear artillery and, instead of deploying real missiles and guns, the enemy can deploy dummies, thus diverting the attention of Soviet *razvedka* and protecting the real tactical nuclear weapons under cover.

The Soviet high command therefore had to devise the sort of means of detection that could approach very close to the enemy's weapons and in each case provide a precise answer to the question of whether they were real, or just well produced dummies. But even if a tremendous number of nuclear batteries were discovered in good time, that did not solve the problem. In the time it takes for the transmission of the reports from the reconnaissance units to the headquarters, for the analysis of the information obtained and the preparation of the appropriate command for action, the battery can have changed position several times. So forces had to be created that would be able to seek out, find and destroy immediately the nuclear weapons discovered in the course of war or immediately before its outbreak.

Spetsnaz was, and is, precisely such an instrument, permitting commanding officers at army level and higher to establish independently the whereabouts of the enemy's most dangerous weapons and to destroy them on the spot.

Is it possible for *spetsnaz* to pinpoint and destroy every single one of the enemy's nuclear weapons? Of course not. So what is the solution to this problem? It is very simple. *Spetsnaz* has to make every effort to find and destroy the enemy's nuclear armament. Nuclear strength represents the teeth of the state and it has to be knocked out with the first blow, possibly even before the fighting begins. But if it proves impossible to knock out all the teeth with the first blow, then a blow has to be struck not just at the teeth but at the brain and nervous system of the state.

When we speak of the 'brain' we mean the country's most important statesmen and politicians. In this context the leaders of the opposition

parties are regarded as equally important candidates for destruction as the leaders of the party in power. The opposition is simply the state's reserve brain, and it would be silly to destroy the main decision-making system without putting the reserve system out of action. By the same token we mean, for example, the principal military leaders and police chiefs, the heads of the Church and trade unions and in general all the people who might at a critical moment appeal to the nation and who are well known to the nation.

By the 'nervous system' of the state we mean the principal centres and lines of government and military communications, and the commercial communications companies, including the main radio stations and television studios.

It would hardly be possible, of course, to destroy the brain, the nervous system and the teeth at once, but a simultaneous blow at all three of the most important organs could, in the opinion of the Soviet leaders, substantially reduce a nation's capacity for action in the event of war, especially at its initial and most critical stage. Some missiles will be destroyed and others will not be fired because there will be nobody to give the appropriate command or because the command will not be passed on in time due to the breakdown of communications.

Having within its sphere an organisation like *spetsnaz*, and having tested its potential on numerous exercises, the Soviet high command came to the conclusion that *spetsnaz* could be used with success not only against tactical but also against strategic nuclear installations: submarine bases, weapon stockpiles, aircraft bases and missile launching sites.

Spetsnaz could be used too, they realised, against the heart and blood supply of the state: ie. its source and distribution of energy -- power stations, transformer stations and power lines, as well as oil and gas pipelines and storage points, pumping station and oil refineries. Putting even a few of the enemy's more important power stations out of action could present him with a catastrophic situation. Not only would there be no light: factories would be brought to a standstill, lifts would cease to work, the refrigeration installations would be useless, hospitals would find it almost impossible to function, blood stored in refrigerators would begin to coagulate, traffic lights, petrol pumps and trains would come to a halt, computers would cease to operate.

Even this short list must lead to the conclusion that Soviet military *razvedka* (the GRU) and its integral *spetsnaz* is something more than the 'eyes and ears of the Soviet Army'. As a special branch of the GRU *spetsnaz* is intended primarily for action in time of war and in the very last days and hours before it breaks out. But *spetsnaz* is not idle in peacetime either. I am sometimes asked: if we are talking about terrorism on such a scale, we must be talking about the KGB. Not so. There are three good reasons why *spetsnaz* is a part of the GRU and not of the KGB. The first is that if the GRU and *spetsnaz* were to be removed from the Soviet Army and handed over to the KGB, it would be equivalent to blindfolding a strong man, while plugging his ears and depriving him of some other important organs, and making him fight with the information he needs for fighting provided by another person standing beside him and telling him the moves. The Soviet leaders have tried on more than one occasion to do this and it has always ended in catastrophe. The information provided by the secret police was always imprecise, late and insufficient, and the actions of a blind giant, predictably, were neither accurate or effective.

Secondly, if the functions of the GRU and *spetsnaz* were to be handed over to the KGB, then in the event of a catastrophe (inevitable in such a situation) any Soviet commanding officer or chief of staff could say that he had not had sufficient information about the enemy, that for example a vital aerodrome and a missile battery nearby had not been destroyed by the KGB's forces. These would be perfectly justified complaints, although it is in any case impossible to destroy every aerodrome, every missile battery and every command post because the supply of information in the course of battle is always insufficient. Any commanding officer who receives information about the enemy can think of a million supplementary questions to which there is no answer. There is only one way out of the situation, and that is to make every commanding officer responsible for gathering his own information about the enemy and to provide him with all the means for defeating his own enemy. Then, if the information is insufficient or some targets have not been destroyed, only he and his chief of staff are to blame. They must themselves organise the collection and interpretation of information about the enemy, so as to have, if not all the information, at least the most essential information at the right time. They must organise the operation of their forces so as to destroy the most important obstacles which the enemy has put in the way of their advance. This is the only way to ensure victory. The Soviet political leadership, the KGB and the military leaders have all had every opportunity to convince themselves that there is no other.

Thirdly, the Soviet secret police, the KGB, carries out different functions and has other priorities. It has its own terrorist apparatus, which includes an organisation very similar to *spetsnaz*, known as *osnaz*. The KGB uses *osnaz* for carrying out a range of tasks not dissimilar in many cases to those performed by the GRU's *spetsnaz*. But the Soviet leaders consider that it is best not to have any monopolies in the field of secret warfare. Competition, they feel, gives far better results than ration.

Osnaz is not a subject I propose to deal with in this book. Only a KGB officer directly connected with *osnaz* could describe what it is. My knowledge is very limited. But just as a book about Stalin would not be complete without some reference to Hitler, *osnaz* should not be overlooked here.

The term *osnaz* is usually met only in secret documents. In unclassified documents the term is written out in full as *osobogo nazhacheniya* or else reduced to the two letters 'ON'. In cases where a longer title is abbreviated the letters ON are run together with the preceding letters. For example, DON means 'division of *osnaz*', OON means a 'detachment of *osnaz*'.

The two words *osoby* and *spetsialny* are close in meaning but quite different words. In translation it is difficult to find a precise equivalent for these two words, which is why it is easier to use the terms *osnaz* and *spetsnaz* without translating them. *Osnaz* apparently came into being practically at the same time as the Communist dictatorship. In the very first moments of the existence of the Soviet regime we find references to detachments *osobogo nazhacheniya* -- special purpose detachments. *Osnaz* means military-terrorist units which came into being as shock troops of the Communist Party whose job was to defend the party. *Osnaz* was later handed over to the secret police, which changed its own name from time to time as easily as a snake changes its skin: Cheka -- VCheka -- OGPU -- NKVD -- NKGB -- MGB -- MVD -- KGB. Once a snake, however, always a snake.

It is the fact the *spetsnaz* belongs to the army, and *osnaz* to the

secret police, that accounts for all the differences between them. *Spetsnaz* operates mainly against external enemies; *osnaz* does the same but mainly in its own territory and against its own citizens. Even if both *spetsnaz* and *osnaz* are faced with carrying out one and the same operation the Soviet leadership is not inclined to rely so much on co-operation between the army and the secret police as on the strong competitive instincts between them.

Chapter 3. A History of *Spetsnaz*

In order to grasp the history behind *spetsnaz* it is useful to cast our minds back to the British Parliament in the time of Henry VIII. In 1516 a Member of the Parliament, Thomas More, published an excellent book entitled *Utopia*. In it he showed, simply and persuasively, that it was very easy to create a society in which universal justice reigned, but that the consequences of doing so would be terrible. More describes a society in which there is no private property and in which everything is controlled by the state. The state of Utopia is completely isolated from the outside world, as completely as the bureaucratic class rules the population. The supreme ruler is installed for his lifetime. The country itself, once a peninsula, has after monumental efforts on the part of the population and the army to build a deep canal dividing it from the rest of the world, become an island. Slavery has been introduced, but the rest of the population live no better than slaves. People do not have their own homes, with the result that anybody can at any time go into any home he wishes, a system which is worse even than the regulations in the Soviet Army today, in which the barracks of each company are open only to soldiers of that company.

In fact the system in Utopia begins to look more like that in a Soviet concentration camp. In Utopia, of course, it is laid down when people are to rise (at four o'clock in the morning), when they are to go to bed and how many minutes' rest they may have. Every day starts with public lectures. People must travel on a group passport, signed by the Mayor, and if they are caught without a passport outside their own district they are severely punished as deserters. Everybody keeps a close watch on his neighbour: 'Everyone has his eye on you.'

With fine English humour Thomas More describes the ways in which Utopia wages war. The whole population of Utopia, men and women, are trained to fight. Utopia wages only just wars in self-defence and, of course, for the liberation of other peoples. The people of Utopia consider it their right and their duty to establish a similarly just regime in neighbouring countries. Many of the surrounding countries have already been liberated and are now ruled, not by local leaders, but by administrators from Utopia. The liberation of the other peoples is carried out in the name of humanism. But Thomas More does not explain to us what this 'humanism' is. Utopia's allies, in receipt of military aid from her, turn the populations of the neighbouring states into slaves.

Utopia provokes conflicts and contradictions in the countries which have not yet been liberated. If someone in such a country speaks out in favour of capitulating to Utopia he can expect a big reward later. But

anyone who calls upon the people to fight Utopia can expect only slavery or death, with his property split up and distributed to those who capitulate and collaborate.

On the outbreak of war Utopia's agents in the enemy country post up in prominent places announcements concerning the reward to be paid to anyone killing the king. It is a tremendous sum of money. There is also a list of other people for whose murder large sums of money will be paid.

The direct result of these measures is that universal suspicion reigns in the enemy country.

Thomas More describes only one of the stratagems employed, but it is the most important:

When the battle is at its height a group of specially selected young men, who have sworn to stick together, try to knock out the enemy general. They keep hammering away at him by every possible method -- frontal attacks, ambushes, long-range archery, hand-to-hand combat. They bear down on him in a long, unbroken wedge-formation, the point of which is constantly renewed as tired men are replaced by fresh ones. As a result the general is nearly always killed or taken prisoner -- unless he saves his skin by running away.

It is the groups of 'specially selected young men' that I want to discuss in this book.

Four hundred years after the appearance of Utopia the frightful predictions of that wise Englishman became a reality in Russia. A successful attempt was made to create a society of universal justice. I had read Thomas More's frightening forecasts when I was still a child and I was amazed at the staggering realism with which Utopia was described and how strikingly similar it was to the Soviet Union: a place where all the towns looked like each other, people knew nothing about what was happening abroad or about fashion in clothes (everybody being dressed more or less the same), and so forth. More even described the situation of people 'who think differently'. In Utopia, he said, 'It is illegal for any such person to argue in defence of his beliefs.'

The Soviet Union is actually a very mild version of Utopia -- a sort of 'Utopia with a human face'. A person can travel in the Soviet Union without having an internal passport, and Soviet bureaucrats do not yet have such power over the family as their Utopia counterparts who added up the number of men and women in each household and, if they exceeded the number permitted, simply transferred the superfluous members to another house or even another town where there was a shortage of them.

The Communists genuinely have a great deal left to do before they bring society down to the level of Utopia. But much has already been done, especially in the military sphere, and in particular in the creation of 'specially selected groups of young men'.

It is interesting to note that such groups were formed even before the Red Army existed, before the Red Guard, and even before the Revolution. The origins of *spetsnaz* are to be found in the revolutionary terrorism of the nineteenth century, when numerous groups of young people were ready to commit murder, or possibly suicide, in the cause of creating a society in

which everything would be divided equally between everybody. As they went about murdering others or getting killed themselves they failed to understand one simple truth: that in order to create a just society you had to create a control mechanism. The juster the society one wants to build the more complete must be the control over production and consumption.

Many of the first leaders of the Red Army had been terrorists in the past, before the Revolution. For example, one of the outstanding organisers of the Red Army, Mikhail Frunze, after whom the principal Soviet military academy is named, had twice been sentenced to death before the Revolution. At the time it was by no means easy to get two death sentences. For organising a party which aimed at the overthrow of the existing regime by force, Lenin received only three years of deportation in which he lived well and comfortably and spent his time shooting, fishing and openly preaching revolution. And the woman terrorist Vera Zasulich, who murdered a provincial governor was acquitted by a Russian court. The court was independent of the state and reckoned that, if she had killed for political reasons, it meant that she had been prompted by her conscience and her beliefs and that her acts could not be regarded as a crime. In this climate Mikhail Frunze had managed to receive two death sentences. Neither of them was carried out, naturally. On both occasions the sentence was commuted to deportation, from which he had no great difficulty in escaping. It was while he was in exile that Frunze organised a circle of like-minded people which was called the 'Military Academy': a real school for terrorists, which drew up the first strategy to be followed up by armed detachments of Communists in the event of an uprising.

The seizure of power by the Bolsheviks demonstrated, primarily to the revolutionaries themselves, that it was possible to neutralise a vast country and then to bring it under control simply and quickly. What was needed were 'groups of specially selected young men' capable of putting out of action the government, the postal services, the telegraph and telephone, and the railway terminals and bridges in the capital. Paralysis at the centre meant that counteraction on the outskirts was split up. Outlying areas could be dealt with later one at a time.

Frunze was undoubtedly a brilliant theoretician and practitioner of the art of war, including partisan warfare and terrorism. During the Civil War he commanded an army and a number of fronts. After Trotsky's dismissal he took over as People's Commissar for military and naval affairs. During the war he reorganised the large but badly led partisan formations into regular divisions and armies which were subordinated to the strict centralised administration. At the same time, while commanding those formations, he kept sending relatively small but very reliable mobile units to fight in the enemy's rear.

The Civil War was fought over vast areas, a war of movement without a continuous stable front and with an enormous number of all sorts of armies, groups, independent detachments and bands. It was a partisan war in spirit and in content. Armies developed out of small, scattered detachments, and whenever they were defeated they were able to disintegrate into a large number of independent units which carried on the war on a partisan scale.

But we are not concerned here with the partisan war as a whole, only with the fighting units of the regular Red Army specially created for operating in the enemy's rear. Such units existed on various fronts and armies. They were not known as *spetsnaz*, but this did not alter their

essential nature, and it was not just Frunze who appreciated the importance of being able to use regular units in the rear of the enemy. Trotsky, Stalin, Voroshilov, Tukhachevsky, *inter alia*, supported the strategy and made extensive use of it.

Revolutionary war against the capitalist powers started immediately after the Bolsheviks seized power. As the Red Army 'liberated' fresh territory and arrived at the frontiers with other countries the amount of subversion directed against them increased. The end of the Civil War did not mean the end of the secret war being waged by the Communists against their neighbours. On the contrary, it was stepped up, because, once the Civil War was over, forces were released for other kinds of warfare.

Germany was the first target for revolution. It is interesting to recall that, as early as December 1917, a Communist newspaper *Die Fackel*, was being published in Petrograd with a circulation of 500,000 copies. In January 1918 a Communist group called 'Spartak' emerged in the same place. In April 1918 another newspaper *Die Weltrevolution*, began to appear. And finally, in August 1919, the famous paper of the German Communists, *Die Rote Fahne*, was founded in Moscow.

At the same time as the first Communist groups appeared, steps were taken to train terrorist fighting units of German Communists. These units were used for suppressing the anti-Communist resistance put up by Russian and Ukrainian peasants. Then, in 1920, all the units of German Communists were gathered together in the rear of the Red Army on the Western front. That was when the Red Army was preparing for a breakthrough across Poland and into Germany. The Red Army's official marching song, 'Budenny's March', included these words: 'We're taking Warsaw -- Take Berlin too!'

In that year the Bolsheviks did not succeed in organising revolution in Germany or even in 'liberating' Poland. At the time Soviet Russia was devastated by the First World War and by the far more terrible Civil War. Famine, typhus and destruction raged across the country. But in 1923 another attempt was made to provoke a revolution in Germany. Trotsky himself demanded in September 1923 to be relieved of all his Party and Government posts and to be sent as an ordinary soldier to the barricades of the German Revolution. The party did not send Trotsky there, but sent other Soviet Communist leaders, among them, Iosef Unshlikht. At the time he was deputy chairman of the Cheka secret police. Now he was appointed deputy head of the 'registration administration', now known as the GRU or military intelligence, and it was in this position that he was sent illegally to Germany. 'Unshlikht was given the task of organising the detachments which were to carry out the armed uprising and coup d'état, recruiting them and providing them with weapons. He also had the job of organising a German Cheka for the extermination of the bourgeoisie and opponents of the Revolution after the transfer of power.... This was how the planned Revolution was planned to take place. On the occasion of the anniversary of the Russian October Revolution the working masses were to come out on the streets for mass demonstrations. Unshlikht's "Red hundreds" were to provoke clashes with the police so as to cause bloodshed and more serious conflicts, to inflame the workers' indignation and carry out a general working-class uprising.'¹

¹ B. Bazhanov: 'Memoirs of a Secretary to Stalin', pub. *Tretya volna* 1980, pp 67-69.

In view of the instability of German Society at that time, the absence of a powerful army, the widespread discontent and the frequent outbursts of violence, especially in 1923, the plan might have been realised. Many experts are inclined to the view that Germany really was close to revolution. Soviet military intelligence and its terrorist units led by Unshlikht were expected to do no more than put the spark to the powder keg.

There were many reasons why the plans came to nothing. But there were two especially important ones: the absence of a common frontier between the USSR and Germany, and the split in the German Communist Party. The lack of a common frontier was at the time a serious obstacle to the penetration into Germany of substantial forces of Soviet subversives. Stalin understood this very well, and he was always fighting to have Poland crushed so that common frontiers could be established with Germany. When he succeeded in doing this in 1939, it was a risky step, since a common frontier with Germany meant that Germany could attack the USSR without warning, as indeed happened two years later. But without a common frontier Stalin could not get into Europe.

The split in the German Communist Party was an equally serious hindrance to the carrying out of Soviet plans. One group pursued policy, subservient to the Comintern and consequently to the Soviet Politburo, while the other pursued an antagonistic one. Zinoviev was 'extremely displeased by this and he raised the question in the Politburo of presenting Maslov *one of the dissenting German Communist leaders* with an ultimatum: either he would take a large sum of money, leave the party and get out of Germany, or Unshlikht would be given orders to liquidate him.'²

² Ibid. p. 68

At the same time as preparations were being made for revolution in Germany preparations were also going ahead for revolutions in other countries. For example, in September 1923, groups of terrorists trained in the USSR (of both Bulgarian and Soviet nationality) started causing disturbances in Bulgaria which could very well have developed into a state of general chaos and bloodletting. But the 'revolution' was suppressed and its ringleaders escaped to the Soviet Union. Eighteen months later, in April 1925, the attempt was repeated. This time unknown persons caused a tremendous explosion in the main cathedral in Sofia in the hope of killing the king and the whole government. Boris III had a miraculous escape, but attempts to destabilise Bulgaria by acts of terrorism continued until 1944, when the Red Army at last entered Bulgaria. Another miracle then seemed to take place, because from that moment on nobody has tried to shoot the Bulgarian rulers and no one has let off any bombs. The terror did continue, but it was aimed at the population of the country as a whole rather than the rulers. And then Bulgarian terrorism spread beyond the frontiers of the country and appeared on the streets of Western Europe.

The campaign of terrorism against Finland is closely linked with the name of the Finnish Communist Otto Kuusinen who was one of the leaders of the Communist revolt in Finland in 1918. After the defeat of the 'revolution' he escaped to Moscow and later returned to Finland for underground work. In 1921 he again fled to Moscow to save himself from

arrest. From that moment Kuusinen's career was closely linked with Soviet military intelligence officers. Kuusinen had an official post and did the same work: preparing for the overthrow of democracy in Finland and other countries. In his secret career Kuusinen had some notable successes. In the mid-1930s he rose to be deputy head of *Razvedupr* as the GRU was known then. Under Kuusinen's direction an effective espionage network was organised in the Scandinavian countries, and at the same time he directed the training of military units which were to carry out acts of terrorism in those countries. As early as the summer of 1918 an officer school was founded in Petrograd to train men for the 'Red Army of Finland'. This school later trained officers for other 'Red Armies' and became the International Military School -- an institute of higher education for terrorists.

After the Civil War was over Kuusinen insisted on carrying on underground warfare on Finnish territory and keeping the best units of Finnish Communists in existence. In 1939, after the Red Army invaded Finland, he proclaimed himself 'prime minister and minister of foreign affairs' of the 'Finnish Democratic Republic'. The 'government' included Mauri Rosenberg (from the GRU) as 'deputy prime minister', Axel Antila as 'minister of defence' and the NKVD interrogator Tuure Lekhen as 'minister of internal affairs'. But the Finnish people put up such resistance that the Kuusinen government's bid to turn Finland into a 'people's republic' was a failure.

(A curious fact of history must be mentioned here. When the Finnish Communists formed their government on Soviet territory and started a war against their own country, voluntary formations of Russians were formed in Finland which went into battle against both the Soviet and the Finnish Communists. A notable member of these genuinely voluntary units was Boris Bazhanov, formerly Stalin's personal secretary, who had fled to the West.)

Otto Kuusinen's unsuccessful attempt to become the ruler of Communist Finland did not bring his career to an end. He continued it with success, first in the GRU and later in the Department of Administrative Organs of the Central Committee of the CPSU -- the body that supervises all the espionage and terrorist institutions in the Soviet Union, as well as the prisons, concentration camps, courts and so forth. From 1957 until his death in 1964 Kuusinen was one of the most powerful leaders in the Soviet Union, serving simultaneously as a member of the Politburo and a Secretary of the Central Committee of the Party. In the Khodynki district of Moscow, where the GRU has its headquarters, one of the bigger streets is called Otto Kuusinen Street.

In the course of the Civil War and after it, Polish units, too, were formed and went into action on Soviet territory. One example was the 1st Revolutionary Regiment, 'Red Warsaw', which was used for putting down anti-Communist revolts in Moscow, Tambov and Yaroslavl. For suppressing anti-Communist revolts by the Russian population the Communists used a Yugoslav regiment, a Czechoslovak regiment, and many other formations, including Hungarians, Rumanians, Austrians and others. After the Civil War all these formations provided a base for the recruitment of spies and for setting up subversive combat detachments for operating on the territory of capitalist states. For example, a group of Hungarian Communist terrorists led by Ferenc Kryug, fought against Russian peasants in the Civil War; in the Second World War Kryug led a special purpose group operating in Hungary.

Apart from the 'internationalist' fighters, i.e. people of foreign

extraction, detachments were organised in the Soviet Union for operating abroad which were composed entirely, or very largely, of Soviet citizens. A bitter battle was fought between the army commanders and the secret police for control of these detachments.

On 2 August 1930 a small detachment of commando troops was dropped in the region of Voronezh and was supposed during the manoeuvres to carry out operations in the rear of the 'enemy'. Officially this is the date when Soviet airborne troops came into being. But it is also the date when *spetsnaz* was born. Airborne troops and *spetsnaz* troops subsequently went through a parallel development. At certain points in its history *spetsnaz* passed out of the control of military intelligence into the hands of the airborne forces, at others the airborne troops exercised administrative control while military intelligence had operational control. But in the end it was reckoned to be more expedient to hand *spetsnaz* over entirely to military intelligence. The progress of *spetsnaz* over the following thirty years cannot be studied in isolation from the development of the airborne forces.

1930 marked the beginning of a serious preoccupation with parachute troops in the USSR. In 1931 separate detachments of parachutists were made into battalions and a little later into regiments. In 1933 an *osnaz* brigade was formed in the Leningrad military district. It included a battalion of parachutists, a battalion of mechanised infantry, a battalion of artillery and three squadrons of aircraft. However, it turned out to be of little use to the Army, because it was not only too large and too awkward to manage, but also under the authority of the NKVD rather than the GRU. After a long dispute this brigade and several others created on the same pattern were reorganised into airborne brigades and handed over entirely to the Army.

To begin with, the airborne forces or VDV consisted of transport aircraft, airborne regiments and brigades, squadrons of heavy bombers and separate reconnaissance units. It is these reconnaissance units that are of interest to us. How many there were of them and how many men they included is not known. There is fragmentary information about their tactics and training. But it is known, for example, that one of the training schools was situated in Kiev. It was a secret school and operated under the disguise of a parachute club, while being completely under the control of the *Razvedupr* (GRU). It included a lot of women. In the course of the numerous manoeuvres that were held, the reconnaissance units were dropped in the rear of the 'enemy' and made attacks on his command points, headquarters, centres and lines of communications. It is known that terrorist techniques were already well advanced. For example, a mine had been developed for blowing up railway bridges as trains passed over them. However, bridges are always especially well guarded, so the experts of the *Razvedupr* and the Engineering Directorate of the Red Army produced a mine that could be laid on the tracks several kilometres away from the bridge. A passing train would pick up the mine which would detonate at the very moment when the train was on the bridge.

To give some idea of the scale of the VDV, on manoeuvres in 1934 900 men were dropped simultaneously by parachute. At the famous Kiev manoeuvres in 1935 no less than 1188 airborne troops were dropped at once, followed by a normal landing of 1765 men with light tanks, armoured cars and artillery. In Belorussia in 1936 there was an air drop of 1800 troops and a landing of 5700 men with heavy weapons. In the Moscow military district in the same

year the whole of the 84th rifle division was transferred from one place to another by air. Large-scale and well armed airborne attacks were always accompanied by the dropping in neighbouring districts of commando units which operated both in the interests of the security of the major force and in the interests of *Razvedupr*.

In 1938 the Soviet Union had six airborne brigades with a total of 18,000 men. This figure is, however, deceptive, since the strength of the 'separate reconnaissance units' is not known, nor are they included in that figure. Parachutists were also not trained by the Red Army alone but by 'civilian' clubs. In 1934 these clubs had 400 parachute towers from which members made up to half a million jumps, adding to their experience by jumps from planes and balloons. Many Western experts reckon that the Soviet Union entered the Second World War with a million trained parachutists, who could be used both as airborne troops and in special units -- in the language of today, in *spetsnaz*.

A continual, hotly contested struggle was going on in the General Staff of the Red Army. On what territory were the special detachments to operate -- on the enemy's territory, or on Soviet territory when it was occupied by the enemy?

For a long time the two policies existed side by side. Detachments were trained to operate both on home territory and enemy territory as part of the preparations to meet the enemy in the Western regions of the Soviet Union. These were carried out very seriously. First of all large partisan units were formed, made up of carefully screened and selected soldiers. The partisans went on living in the towns and villages, but went through their regular military training and were ready at any moment to take off into the forests. The units were only the basis upon which to develop much larger-scale partisan warfare. In peacetime they were made up largely of leaders and specialists; in the course of the fighting each unit was expected to expand into a huge formation consisting of several thousand men. For these formations hiding places were prepared in secluded locations and stocked with weapons, ammunition, means of communications and other necessary equipment.

Apart from the partisans who were to take to the forests a vast network of reconnaissance and commando troops was prepared. The local inhabitants were trained to carry out reconnaissance and terrorist operations and, if the enemy arrived, they were supposed to remain in place and pretend to submit to the enemy, and even work for him. These networks were supposed later to organise a fierce campaign of terror inside the enemy garrisons. To make it easier for the partisans and the terrorists to operate, secret communication networks and supplies were set up in peacetime, along with secret meeting places, underground hospitals, command posts and even arms factories.

To make it easier for the partisans to operate on their own territory a 'destruction zone' was created, also known as a 'death strip'. This was a strip running the length of the Western frontiers of the Soviet Union between 100 and 250 kilometres wide. Within that strip *all* bridges, railway depots, tunnels, water storage tanks and electric power stations were prepared for destruction by explosive. Also in peacetime major embankments

on railway lines and highways and cuttings through which the roads passed were made ready for blowing up. Means of communication, telephone lines, even the permanent way, all were prepared for destruction.

Immediately behind the 'death strip' came the 'Stalin Line' of exceptionally well fortified defences. The General Staff's idea was that the enemy should be exhausted in the 'death strip' on the vast minefields and huge obstacles and then get stuck on the line of fortifications. At the same time the partisans would be constantly attacking him in the rear.

It was a magnificent defence system. Bearing in mind the vast territories involved and the poor network of roads, such a system could well have made the whole of Soviet territory practically impassable for an enemy. But -- in 1939 the Ribbentrop-Molotov pact was signed.

The Pact was the signal for a tremendous expansion of Soviet military strength. Everything connected with defence was destroyed, while everything connected with offensive actions was expanded at a great rate, particularly Soviet sabotage troops and the airborne troops connected with them. In April 1941 five airborne corps were formed. All five were in the first strategic echelon of the Red Army, three facing Germany and two facing Rumania. The latter were more dangerous for Germany than the other three, because the dropping of even one airborne corps in Rumania and the cutting off, even temporarily, of supplies of oil to Germany meant the end of the war for the Germans.

Five airborne corps in 1941 was more than there were in all the other countries of the world together. But this was not enough for Stalin. There was a plan to create another five airborne corps, and the plan was carried out in August and September 1941. But in a defensive war Stalin did not, of course, need either the first five or the second five. Any discussion of Stalin's 'defence plans' must first of all explain how five airborne corps, let alone ten, could be used in a defensive war.

In a war on one's own territory it is far easier during a temporary retreat to leave partisan forces or even complete fighting formations hidden on the ground than it is to drop them in later by parachute. But Stalin had destroyed such formations, from which one can draw only one conclusion; Stalin had prepared the airborne corps specifically for dropping on other people's territory.

At the same time as the rapid expansion of the airborne forces there was an equally rapid growth of the special reconnaissance units intended for operations on enemy territory.

The great British strategist and historian B. H. Liddell Hart, dealing with this period, speaks of Hitler's fears concerning Stalin's intentions, referring to 'a fatal attack in the back from Russia'.³ And moves by the Soviet Union in June 1940 did evoke particular nervousness in the German high command. Germany had thrown all her forces against France at that time, and the Soviet Union rushed troops into the Baltic states and Bessarabia. The airborne troops especially distinguished themselves. In June 1940 the 214th Soviet airborne brigade was dropped with the idea of seizing a group of aerodromes in the region of Shaulyai in Lithuania, under a hundred kilometres from the East Prussian border. In the same month the 201st and 204th airborne brigades were dropped in Bessarabia to capture the towns of Ismail and Belgrad-Dnestrovsky. This was close by the Ploesti oilfields. What would Stalin do if the German Army advanced further into North Africa and the British Isles?

³ *Strategy. The Indirect Approach*, p.241.

It is easy to understand why Hitler took the decision in that next month, July 1940, to prepare for war against the USSR. It was quite impossible for him to move off the continent of Europe and into the British Isles or Africa, leaving Stalin with his huge army and terrifying airborne forces which were of no use to him for anything but a large-scale offensive.

Hitler guessed rightly what Stalin's plans were, as is apparent from his letter to Mussolini of 21 June 1941.⁴ Can we believe Hitler? In this case we probably can. The letter was not intended for publication and was never published in Hitler's lifetime. It is interesting in that it repeats the thought that Stalin had voiced at a secret meeting of the Central Committee. Moreover, in his speech at the 18th Congress of the Soviet Communist Party Stalin had had this to say about Britain and France; In their policy of nonintervention can be detected an attempt and a desire not to prevent the aggressors from doing their dirty work... not to prevent, let us say, Germany getting bogged down in European affairs and involved in a war... to let all the participants in the war get stuck deep in the mud of battle, to encourage them to do this on the quiet, to let them weaken and exhaust each other, and then, when they are sufficiently weakened, to enter the arena with fresh forces, acting of course "in the interests of peace", and to dictate their own conditions to the crippled participants in the war.⁵ Once again, he was attributing to others motives which impelled him in his ambitions. Stalin wanted Europe to exhaust itself. And Hitler understood that. But he understood too late. He should have understood before the Pact was signed.

⁴ 'I cannot take responsibility for the waiting any longer, because I cannot see any way that the danger will disappear.... The concentration of Soviet force is enormous.... All available Soviet armed forces are now on our border.... It is quite possible that Russia will try to destroy the Rumanian oilfields.'

⁵ *Pravda*, 11 March 1939.

However, Hitler still managed to upset Stalin's plans by starting the war first. The huge Soviet forces intended for the 'liberation' of Russia's neighbours were quite unnecessary in the war of defence against Germany. The airborne corps were used as ordinary infantry against the advancing German tanks. The many units and groups of airborne troops and commandos were forced to retreat or to dig trenches to halt the advancing German troops. The airborne troops trained for operations in the territory of foreign countries were able to be used in the enemy's rear, but not in his territory so much as in Soviet territory occupied by the German army.

The reshaping of the whole philosophy of the Red Army, which had been taught to conduct an offensive war on other people's territory, was very painful but relatively short. Six months later the Red Army had learnt to defend itself and in another year it had gone over to offensive operations. From that moment everything fell into place and the Red Army, created only for offensive operations, became once again victorious.

The process of reorganising the armed forces for operations on its own territory affected all branches of the services, including the special forces. At the beginning of 1942 thirteen guards battalions⁶ of *spetsnaz* were organised in the Red Army for operations in the enemy's rear, as well as one guards engineering brigade of *spetsnaz*, consisting of five battalions. The number of separate battalions corresponded exactly to the number of fighting fronts. Each front received one such battalion under its command. A guards brigade of *spetsnaz* remained at the disposal of the Supreme Commander-in-Chief, to be used only with Stalin's personal permission in the most crucial locations.

⁶ In the Soviet Army the title of 'guards' can be won only in battle, the only exceptions being certain formations which were awarded the title when they were being formed. These included *spetsnaz* detachments.

So as not to reveal the real name of *spetsnaz*, the independent guards battalion and the brigade were given the code name of 'guards minelayers'. Only a very limited circle of people knew what the name concealed.

A special *razvedka* department was set up in the Intelligence directorate of each front to direct the work of the 'guards minelayers'. Each department had at its disposal a battalion of *spetsnaz*. Later the special *razvedka* departments began recruiting *spetsnaz* agents in territories occupied by the enemy. These agents were intended for providing support for the 'minelayers' when they appeared in the enemy rear. Subsequently each special *razvedka* department was provided with a reconnaissance point of *spetsnaz* to recruit agents.

The guards brigade of *spetsnaz* was headed by one of the outstanding Soviet practitioners of fighting in the rear of the enemy -- Colonel (later Lieutenant-General) Moshe Ioffe.

The number of *spetsnaz* increased very quickly. In unclassified Soviet writings we come across references to the 16th and the 33rd engineering brigade of *spetsnaz*. Apart from detachments operating behind the enemy's lines, other *spetsnaz* units were formed for different purposes: for example, radio battalions for destroying the enemy's radio links, spreading disinformation and tracing the whereabouts of enemy headquarters and communication centres so as to facilitate the work of the *spetsnaz* terrorist formations. It is known that from 1942 there existed the 130th, 131st, 132nd and 226th independent radio battalions of *spetsnaz*.

The operations carried out by the 'minelayers' were distinguished by their daring character and their effectiveness. They usually turned up behind the enemy's lines in small groups. Sometimes they operated independently, at others they combined their operations with the partisans. These joint operations always benefited both the partisans and *spetsnaz*. The minelayers taught the partisans the most difficult aspects of minelaying, the most complicated technology and the most advanced tactics. When they were with the partisans they had a reliable hiding place, protection while they carried out their operation, and medical and other aid in case of need. The partisans knew the area well and could serve as guides. It was an excellent combination: the local partisans who knew every tree in the forest, and the first-class technical equipment for the use of explosives demonstrated by real experts.

The 'guards minelayers' usually came on the scene for a short while,

did their work swiftly and well and then returned whence they had come. The principal way of transporting them behind the enemy's lines was to drop them by parachute. Their return was carried out by aircraft using secret partisan airfields, or they made their way by foot across the enemy's front line.

The high point in the partisan war against Germany consisted of two operations carried out in 1943. By that time, as a result of action by *osnaz*, order had been introduced into the partisan movement; it had been 'purged' and brought under rigid central control. As a result of *spetsnaz* work the partisan movement had been taught the latest methods of warfare and the most advanced techniques of sabotage.

The operation known as the 'War of the Rails' was carried out over six weeks from August to September 1943. It was a very fortunate time to have chosen. It was at that moment when the Soviet forces, having exhausted the German army in defensive battles at Kursk, themselves suddenly went over to the offensive. To support the advance a huge operation was undertaken in the rear of the enemy with the object of paralysing his supply routes, preventing him from bringing up ammunition and fuel for the troops, and making it impossible for him to move his reserves around. The operation involved the participation of 167 partisan units with a total strength of 100,000 men. All the units of *spetsnaz* were sent behind the enemy lines to help the partisans. More than 150 tons of explosives, more than 150 kilometres of wire and over half a million detonators were transported to the partisan units by air. The *spetsnaz* units were instructed to maintain a strict watch over the fulfilment of their tasks. Most of them operated independently in the most dangerous and important places, and they also appointed men from their units to instruct the partisan units in the use of explosives.
